	loose everything not just a piece of farm land.If you feel the need that you HAVE to do something to a road that functions just fine other than (idiots) out there , then out put a turning lane in.A turning lane will be an,agree to disagree situation.I promise you.And again I bring up my biggest concerns that I brought up last year! We see how icy and tilted the round about gets upon the mileground/705 intersection and its fairly flat ground,you tell me how can it be safe to add a round about on the side of a hill on a road that never gets touched by DOH in the winter time anyway and you have all these dump trucks,mac trucks,ect. Coming off the hill on an icy round about and someone in a tiny car in front of them with children in the vehicle ,you tell me how that situation is going to end?Ive heard that the one that brings in the ideas to "enhance" our roads aren't even from around here , they come from bigger cities.Yes in big cities im sure these work and as badly as you all want Morgantown to be a big city,IT IS NOT! it is a tiny town being forced to be a big city! That is all from me for now.But ,please just stop the nonsense and put a turning lane in or leave it be completely! Sincerely a concerned citizen that this will effect!
413	No roundabouts! Fix the Kingwood Pike roads that are falling in.
414	NO!!! I live in Reedesville and work in Morgantown. Not only to I travel that way every morning and evening, but my office sits right behind the old atomic grill. It would disrupt so much for not enough gain or need. The farm there would be affected. Bad idea and traffic doesn't even back up that bad there. Roundabouts are for places with a lot of traffic that needs moved through. There's a small wait there at the end of the day and it moves just fine. NO! NO! NO! To the round about!!!
415	I am opposed to the roundabout at the bottom of the Kingwood Pike. This is disrupting a family farm!
416	This is not needed!
417	No roundabout
418	Putting a round about at the four way at the bottom of the Kingwood pike would be completely assanine. And it would ruin a family farm. The traffic there already flows well. Why waste tax payers money on a stupid round about that never works right anyhow and cause more traffic back up like the mile ground. Or like the supposed round about to go in at sabraton, now that road is just messed up.
419	We do not need a roundabout at the end of the Pike. The one on the Mileground is horrendous and is always backed up. There are too many big trucks, not to mention school buses. Won't that be fun to watch? Just accept the fact we need turning lanes. That's all!
420	No roundabouts just turning lanes
421	No roundabout just turning lanes
422	No roundabouts just turning lanes
423	Round-abouts are a waste of tax payer dollars and do not improve traffic safety any more than a turning lane. Eminent domain is nothing more than government sponsored theft from citizens.
424	Yes!!!!
425	Yes!!!!!!!
426	Totally against the roundabout!
427	I feel the money would be better spent on fixing the current roads, there is no need to add a roundabout at the bottom of the pike..as a person that drives it daily I've never had to sit at the light for an extended time...The traffic lights in town are way more difficult to get through without sitting for awhile..#fixwhatsthere

428	I feel it is not necessary to put a round about at the end of the greenbag road, I have lived here 20 years and have never had traffic issues except for when they adjusted the traffic lights. I have several elderly neighbors who will have no way out during construction because of arrons creek road being the only way out. I could also see many accidents happening.
429	I DON'T approve of the roundabout
430	A round-a-bout is a big mistake. I travel 705 every day to go to work. It always backed up in the evenings. What a joke. All that is needed is a left turn signal in the traffic light. A lot less of an expense. Aarons Creek Road as a detour is a joke. Have any one of you traveled Aarons Creek Road. Where are yo supposed to go if you meet a bus. Not enough room for both vehicles.
431	Please find an alternate point for future roundabout consideration and not through an established historical farm and land which would not just rip thrpugh the grass and soil but their families and historical activity using food to help and aid others.
432	This roundabout is unnecessary. Build a parking garage for your students instead.
433	This doesn't seem like a great of my tax money, I'll take the farm instead. Thanks!
434	A round about is not better than a turning lane and this is going to take away people's businesses and family land.
435	Change any intersection possible to roundabouts, if this town/county is really serious about climate change they would remove as many red lights and stop signs as possible.
436	A roundabout is unnecessary and will take away a local family business.
437	It's a sad day that the people in charge feel we need to allocate tax payer dollars for a major road project that is completely unnecessary. You want to completely redo 2 intersections on one road that has traffic problems for 60-90 minutes total. Instead of "realigning" all these intersections (Earl L Core Rd x Greenbag, University Ave x Collins Ferry, 705, etc...) maybe we should take pride in the roads and systems already in place. Our roads are near obstacle courses. Dipping and dunking around pot holes constantly is a horrible look on our community. Yet we let this known problem continue because we want to waste money on new and unnecessary roundabouts. Not only is this a total waste of funds, you want to take away property from people who pay their taxes and own that land!? I've always lived in this town. I bought a house in this town. I love this town. But the constant brash decisions by our city council are ridiculous. WVU keeps buying (untaxed) land yet we want to build a roundabout for a building they purchase. Or out in a new street light because they build a parking garage. It's unfair the way our city council sells the rights of the tax paying people of our county. I can't wait to move out of City limits. I don't know why this would need to be repeated. But DO NOT TAKE PEOPLE LAND FOR YOUR SOLLY ROAD PROJECTS! Take care of the roads we have!
438	This letter is in response to the September 29th public meeting held by the Division of Highways for the Greenbag Road Improvement Project. Thank you for the Division of Highway's hard work in designing this project. The multi-modal improvement of the entire Greenbag Road corridor is a high priority of the Morgantown Monongalia Metropolitan Planning Organization (MMMPO). Greenbag Road is recognized in the area's Metropolitan Transportation Plan (MTP) as an important alternative to WV 7 for truck traffic and vehicular traffic. Greenbag Road also provides multi-modal regional mobility connecting the community to non-motorized transportation assets including the Decker's Creek rail trail. It is for these reasons that the MMMPO strongly supports the Division of Highways efforts to improve the central part Greenbag Road between Luckey Lane and Mississippi Street. We urge the Division of Highways to move forward with this project with all due speed. Thank you for your consideration in this matter.

439	The Kingwood pike DOES NOT need a roundabout!!! Adding turning lanes would just be perfect!!!! Aaron's Creek Road is a cow path and you want to detour traffic that way, stupidest idea ever!!! My husband is a logger with s very large truck, can you imagine him trying to drive Aaron's Creek with a load of logs, pretty much a one lane road, what's he to do when he meets a car???? School buses, they are large, and again trying to detour them to a cow path with a load of kids, AGAIN, STUPIDEST IDEA EVER!!! The winter months that intersection is even more dangerous for these larger vehicles with ice and snow, how do you expect them to do with a roundabout?????? This just isnt a practical solution!!!! Keep the red light, add turning lanes, leave the rest alone....
440	Greenbag rd. Needs turning lanes with a light with green arrows. NO ROUNDABOUT!!!!
441	All we need is a turning lane not a roundabout. Use the money to fix the Pike all the pot holes and caving in road.
442	Round-abouts are a waste of tax payer dollars and do not improve traffic safety any more than a turning lane. Eminent domain is nothing more than government sponsored theft from citizens.
443	I wanted to follow up with you regarding our recent phone call and your concerns about the Greenbag Road Improvement Project (Federal Project No. STP-0857(019)D; State Project No. U331-857-0.067; FR# 20-203-MG-2). According to our phone call, you are concerned that that both the architectural and archaeological reports completed in anticipation of the proposed Greenbag Road project are flawed and lack the proper level of detail to adequately document the significance of the resources in the vicinity of the project area. This included your family's farm, which was documented as the Patton Farm (HPI# MG-2646). In fact, the farm itself was inaccurately named based on your historical research of your family's property in and around the proposed project area. Because the resource was documented from the public access, details of the farm house, including its siding type, window conditions, and associated outbuildings were not properly recorded. Also, areas of former and current agricultural land included within the project area were recorded as previously disturbed when the only disturbance was that required by agricultural pursuits, and the agricultural disturbance does not extend below the typical plow zone. You have noted a discrepancy in documentation you have reviewed regarding the project where one report stated that shovel test pits (STPs) were completed on your property, but then other documentation states that the property was investigated for archaeological potential by using soil augers without mentioning STPs. It is my understanding that your family has found numerous artifacts, both from the prehistoric and historic periods, ranging from projectile points and debitage to buttons and cannonballs, specifically in land that will be directly impacted by the proposed project. There is also concern regarding the consulting parties/public comment portion of the Section 106 review process because, according to information you were provided, the Morgantown Historic Landmarks Commission (MHLC) was not notified about the project because the project is outside of the corporation limits. However, based on a lawsuit conducted by the city several years ago, your family's property was incorporated into the city in case future land use would involve development. You have been in touch with the MHLC, and according to you, the organization is now interested in the project. Because the public comment period is coming to a close, you are concerned that the project will move on before you are able to adequately document your family's architectural and archaeological resources and then not allow for a proper assessment of effect resulting from the proposed project. For my part, I described the difference between the Section 106 process and the National Register nomination process. I also explained that we would be glad to accept your updated documentation on an HPI form to allow for your property to at least be properly documented and archived. I will be forwarding your concerns to the WVDOH to be sure they are informed of your concerns and that our office may need to provide an updated letter based on the additional information we will be provided. As noted during our call, I cannot offer you any promises regarding how the project will move forward, but I will be sure WVDOH knows of your concerns. Hopefully this accurately summarizes our phone call, but please feel free to add to it or provide any additional information from our phone call that I may have forgotten. As I promised on our call, I have CC'ed our Senior Archaeologist, Lora Lamarre, because she will have to address the concerns

	regarding the archaeological portion of the review. Let us know if we can be of any further assistance at this time, and we look forward to receiving your additional information regarding your and your family's property,
444	I am writing concerning State Project: U331-857-0.67 00 Federal Project: STP-0857(019) I am a landowner that is effected and I have some concerns about inaccuracies about my property in the Environmental Assessment.
445	Comments provided via Senator Capito: 1. The state DOT has threatened to steal our farm…..where we have a lucrative hemp business, host other agricultural businesses, and run a nonprofit food program….in order to build a roundabout (greenbag road improvement project). 2. In 2006 a traffic signal was installed and A turning LANE was promised but the project ran out of money and never finished. Our extended family owns the other side of the road and the state could build a turning lane there (on the bad traffic side, and could use our extended familys land which they don't farm on and everyone would be happy with that-plus the state already has a right of way on that side.) 3. Traffic is hardly backed up, on one side, yet they want to spend over 10 million dollars and overbuild this roundabout, destroy our farm, when only one turning lane is needed. The 2-5 year project is egregious and will have detrimental environmental effects as well as noise pollution to the residences and businesses around them for HALF A DECADE?! One of those businesses is Bliss Bliss Bliss, a meditation and massage house of wellness- They Thrive on Silence for Relaxation. 4. Back to the DOH: They already have a right of way for the turning lane. They refused to acknowledge this land is a farm and attempted a Categorical Exclusion until we demanded an Environmental Assessment. 5. We believe the EA that they used was an old version from 2006 (dated facts, inaccurate descriptions) and we would like a new, actually finished one with updated information. 6. Due to covid they had a virtual public meeting but didn't answer one single phone call during the entire 3 hour period (even though a phone option was one of the options presented). 15 minutes before the meeting ended, they announced they weren't taking calls. This silenced the voices of least a dozen people (we have a list of them) that were unable to speak or comment at all because they waited on hold the whole time. 7. No one from the engineering firm, mmmpo, or DOT has responded to the landowners questions and even went as far to return a letter landowner sent, without signing it to receive it (certified mail). 8. I could go on and on but this farm is my family's livelihood. Our business is here. We have farmed this land for over 120 years - longer than Morgantown has been a city. Please we beg you for a letter showing support for our valuable green space. We fuel the local economy with our land, support farm to table with donations of food to poor families, it houses a non profit, share cropping, creates jobs and grows medicine. 9. We just want them to put in the turning lane we offered in 2006: use the right a way they have, save the state money, and save our farm. Please help us.
446	Letter to Emily Muzzarelli - Interim City Manager & Assistant City Manager Morgantown - The Land Reuse and Preservation Agency's Green Belt Connections Committee has been working diligently with local stakeholders, and specifically the Morgantown Green Space Coalition on connecting identified corridors that will benefit the city residents. The physical improvements of the proposed Greenbag Road Improvement Project, specifically the installation of sidewalk and a bike lane on Greenbag Road, will be help make progress towards the Committee's goal of community and amenity connectedness in the greater Morgantown area. The improvements offer a phased approach to the goal of a safe and efficient multi-modal transportation system that will exceed the seven National Transportation Goals. The Greenbag Road Improvement Project will create a needed pedestrian access point across Greenbag Road from residential housing areas to the north to Mountaineer Mall, Dorsey's Knob Park and Giant Eagle to the south. A future pedestrian crossing across Greenbag Road near the intersections in the vicinity of Giant Eagle and White Park will be critical to the community and provide an optimal transportation network for this southern corridor. The Land Reuse and Preservation Agency's Green Belt Connections Committee is available to assist in the development of transportation alternatives incorporating property and right-of-way acquisition in future development near the U.S. 119 intersection. While there is much more work to be

	done by the Committee and its stakeholders, we stand ready to provide our technical expertise and agency tools toward improving connectedness on and across this transportation corridor.
447	This letter is in response to the September 29th public meeting held by the Division of Highways for the Greenbag Road Improvement Project to provide comments on behalf of the City of Morgantown's Green Belt Connections Committee, a committee of the Land Reuse and Preservation Agency. We want to thank you for the work already put into this project during the preliminary design phase. Please see the Green Belt Connections Committee's comments in the attached letter. We hope that you take these comments into consideration and value the support for this important project. We urge the Division of Highways to move forward with this very important project. If you have any questions about comments provided, please do not hesitate to reach out. We would be happy to provide additional details on why these are so important. Thank you for your continued support of an improved transportation system in Morgantown.
448	This letter is in response to the September 29th public meeting held by the Division of Highways for the Greenbag Road Improvement Project to provide comments on behalf of the City of Morgantown. We want to thank you for the work already put into this project during the preliminary design phase. The City of Morgantown has long awaited improvement to Greenbag Road in the hope that this will alleviate truck traffic that currently plagues our downtown district via WV 7. We sincerely appreciate the attention to multi-modal improvements including intersection improvement, sidewalks, and accommodations for bicyclists. We continue to work on multi-modal connections throughout the City, and this is ever important on state owned and operated routes. While we support the overall project, the comments reflected in this letter are directly related to the area of the project that is within our jurisdiction, specifically around the intersection of Greenbag Road and Mississippi Street. This project can serve as a truck route that will benefit downtown businesses and add important pedestrian connections between schools and parks. We support the improvements proposed at the intersection of Greenbag Road and Mississippi Street. If the traffic engineers find that a roundabout provides the highest level of service, and they are designed in a way that provides safe and efficient through way for very large vehicles including tractor trailers, the City would be supportive of this design. I believe that it is important to understand the implications this has directly to the City. Our one and only maintenance garage would be significantly impacted by this change. We understand the importance of this corridor's improvement and can work to accommodate this taking if in the best interest of all parties and the overall project. We would like to see the proposed sidewalk or side path (currently proposed for the north side of Greenbag Road from Mississippi to Dorsey) to extend around the roundabout/intersection along the northern side of Mississippi Street. As you are likely aware, this is in very close proximity to White Park, the Morgantown Ice Arena, several baseball fields, M-TEC and South Middle School. There is a strong sidewalk and trail network in this area, and it would be great to continue making those crucial connections. The City could then prioritize a sidewalk project to "fill the gap" that would remain along Mississippi. This would allow for a continuous pedestrian connection between Mountainview Elementary School and the surrounding neighborhood to South Middle School and the great recreational assets around White Park. We hope you take our recommendations into consideration and value our support for this important project. We urge the Division of Highways to move forward with this very important project. If you have any questions about comments provided, please do not hesitate to reach out. We would be happy to provide additional details on why these are so important. Thank you for your continued support of an improved transportation system in Morgantown.
449	As I send this to you I do so from a different view. I support the work needed on the Greenbag Road in Monongalia County. I also hope that you can work as hard as you can to protect the land being used for farming. These young farmers are working hard to make a start of the family farm. Design to be as mindful as you can, move all top soil to a location they can use, design to disturb as little if any of the land they are using.

450	The Greenbag Road Improvement Project offers a timely opportunity to build infrastructure that will facilitate safe travel by pedestrian and cyclists while connecting neighborhoods to city parks, schools, and local businesses. The WVDOH website public input page notes, "This Project is being undertaken to reduce traffic congestion and address the lack of safe non-motorized connections through the corridor...Community involvement in the development of the Morgantown Monongalia Planning Association (MMMPO) Greenbag Road Corridor Study (2015) identified pedestrian facilities to connect the neighborhood schools with the commercial and residential areas as a key issue for community safety and access." To ensure that the Project meets community needs identified in the MMMPO plan, the Mon Valley Green Space Coalition respectfully requests the following modifications to the DOH Greenbag Rd Improvement Plan: instead of sidewalks, a multi-user asphalt side path should be built on the N side of Greenbag Rd along the entire length of the project area. This will facilitate use by both cyclists and pedestrians while offering a safety barrier between users and vehicular traffic. This multi-user side path should extend to the current signalized intersection of Greenbag Road and the Mountaineer Mall. The project should be amended to include a marked pedestrian corssing from the north side to the south side of Greenbag Rd. A designated safe crossing of Greenbag Rd. will serve residents from low-income neighborhoods who travel on foot and by bicycle to reach the grocery store. Such a crossing will also serve the community by facilitating the connection of two key recreational areas - White Park and Dorsey's Knob Park. A HAWK beacon (High-Intensity Activated crosswalk) at the current western terminus of the project would serve pedestrians and cyclists without disrupting traffic flow because it is inactive unless activated by a pedestrian or cyclist. The proposed roundabout at the interseciton of Greenbag Rd, Kingwood Pike, and Dorsey Ave should be relocated to the northern side of Greenbag Rd. Relocating the roundabout would displace a building that is vacant and preserve greenspace that serves as a community garden and offers significant ecological benefits.
451	Turning lane is all you need at the 4 way on greenbag road. The best option would be on and off ramps to the interstate. I've heard from some old timers that they have already been payed for years ago just was never put in because not enough traffic on the kingwood pike. If you put in on and off ramps on the kingwood pike you will reduce traffic off greenbag road and sabraton exit cause everyone has to use those routes to get to kingwood pike Preston county area. From the bottom of the pike to almost the i68 over pass is a disaster it's falling in needs a total repair. Aaron's creek rd and summer school road and cobun creek road cannot handle all the traffic that will be using the detour route those roads are to narrow for all the big truck traffic. You need to take a hard look into this before you make a decision. The best decision is gonna be the on and off ramps.
452	This is in regards to the open comment period for the proposed roundabouts at the intersection of the Kingwood Pike/Dorsey Ave/Greenbag roads and the intersection of Mississippi and Greenbag Road both located in Morgantown .I live near both areas and while I have experienced traffic congestion, putting in a roundabout to manage traffic seems like an excessive way to reduce or eliminate traffic congestion in both cases. Turning lanes and turning arrow at the Dorsey Ave/Kingwood Pike seem like a cheaper and less destructive alternative to fixing this issue. I would also like to see the plan for the roundabout at the Mississippi and Greenbag intersection re-evaluated to make sure this is the most economical choice and has least impact on the surrounding infrastructure. The traffic patterns here are only congested at certain times of the day and week (mainly when schools are starting or ending).
453	Review of EA by Downstream Strategies and Ltt Soil LLC - summarized: evaluated the EA for identification and loss of prime farmland; stream and wetland impacts; reasonable alternatives. Recommends corrections to classification of land use and designation of the Hastings property; provide information on post construction conditions of streams; quantify and mitigate for increased stormwater discharges; revised wetland report; quantify impacts to wetlands; include and analyze a new option wiht dedicated left turn lanes for the Greenbag Road with no added lanes for Dorsey and Kingwood.

454	Thank you for the opportunity to comment. God knows that Morgantown's road infrastructure is in very poor condition for a variety of reason; we need a much more 'fair' and egalitarian way to budget for and implement road improvement in the local area, one that is based on need, on our contributions to the state's taxes, and on our growth. The reasons that our existing transportation infrastructure is so poor include: poor design and construction; lack of maintenance; heavy truck traffic that is inappropriate to the design and maintenance level that currently exists. Therefore, with respect to the Greenbag Road Improvement Project ('Project'), I see it offering a tremendous opportunity to improve on the infrastructure that exists along the corridor, while allowing safe 'active transportation' (aka alternative transportation, aka non-motorized transportation, travel by cyclists and pedestrians) that will, if implemented, help greatly to connect neighborhoods to city parks, schools, and local businesses. I therefore applaud the WV-DOH in their ideas on the project, particularly those that support active transportation. Indeed, the Project …"is being undertaken to reduce traffic congestion and address the lack of safe non-motorized connections through the corridor... Community involvement in the development of the Morgantown Monongalia Planning Association (MMMPO) Greenbag Road Corridor Study (2015) identified pedestrian facilities to connect the neighborhood schools with the commercial and residential areas as a key issue for community safety and access." I would ask you to consider the following: A multi-user asphalt side path should be built on the north side of Greenbag Rd along the entire length of the project area. This will facilitate use by both cyclists and pedestrians while offering a safety barrier between users and vehicular traffic. There is plenty of room here to build a side path. This should be a priority, and it should extend to the current signalized intersection of Greenbag Rd and the Mountaineer Mall. The Project NEEDS to include a marked pedestrian crossing from the north side to the south side of Greenbag Rd. A designated, safe crossing of Greenbag Rd. will serve residents from low-income neighborhoods who travel on foot and by bicycle to reach Giant Eagle. Such a crossing will also serve the community by facilitating the connection of two key recreational areas—White Park and Dorsey's Knob Park. A HAWK beacon (High-Intensity Activated crosswalk) at the current western terminus of the project would serve pedestrians and cyclists without markedly disrupting traffic flow because it is inactive unless activated by a pedestrian or cyclist. Finally, due to the many significant negative environmental and cultural impacts that the proposed roundabout on the eastern end (at the intersection of Greenbag Rd., Kingwood Pike, and Dorsey Ave), I support passing lanes. Given the negative impacts on Aaron Run and Cobun Creek, and the loss of farmland of significant cultural values, I do not support a roundabout in this location. I have had a garden plot at the Conscious Harvest Coop since its inception, and I am fully aware of the incredible productivity, the aid to families that suffer from food insecurity, the scenic values, and the many ecosystem services that this (Hastings Farm) provides. Contrary to the EA, the soils there are very productive and their loss would be a significant impact that could not be fully mitigated, regardless of the method(s) utilized to do so.
455	I am writing to voice my concerns over the proposed idea for a roundabout being constructed for this intersection in Mon county. A roundabout is not the best solution for this intersection. A left turning lane with its own green arrow light will resolve the issue of traffic backing up at certain times of the day. Before the light was installed the intersection worked much better than it currently does but a roundabout is not the answer. Aarons creek road (where traffic will be diverted to for an estimated 2.5 years can not handle this influx of traffic. Not only is it in very poor shape (as are numerous other roads in our county/state) but it is a narrow windy road that will be disastrous come winter time. One person getting hung up will inhibit anyone that lives on that road or the people coming from the detour on the Kingwood pike from getting to town without having to back track onto even more dangerous country roads. For the price of 15 million dollars there are so many other roads that are crumbling apart and that money would be better spent elsewhere. Please come to Morgantown and the surrounding county to see for yourself. In closing, I oppose the roundabout project for this intersection.

456	I live on the Kingwood Pike in Morgantown, WV. I am sending this email to let you know that we do not want to see a roundabout put in at the intersection of Greenbag Road and Kingwood Pike. I travel this intersection daily. There is very seldom any traffic to speak of. Even at rush hour times it is not bad. This would cause a major upheaval to the residents of the area. It would make travel for us nearly impossible. There are no alternative routes that are capable of handling the traffic. Also, there is no alternative route that could handle the truck traffic on the Kingwood Pike. As well as taking farmland from a family that has owned it for years. Especially for something that is not needed. I saw a Facebook article written by Tom Bloom stating that he lives in this area and that this is needed. Mr. Bloom doesn't live anywhere near here. Not sure why he would benefit from this and why he felt the need to post this on Facebook. The money would be much better spent on actually repairing the roads and potholes. We do not want this.
457	Documentation of phone call with Diane Hall: She did not have access to a computer, or did not get any info by mail. I told her if she got me an email address (her daughter-in-law has a computer), then I would send her the link for the public input for project information. If not, I told her I would hard mail a copy of the handout. She said she would let me know. She is very adamant that the roundabout is giant waste of money and resources, and WVDOH would be better to spend money on our roads throughout the state. She said the Mileground is a terrible mess and this would be similar. She is wanting to know why we can't do something like we did at Sabraton, which is great in her opinion. She thinks that using Aaron's Creek Road for a detour is a terrible idea and is very dangerous for the travelling public. She also thinks this entire project is to get the traffic out of Morgantown and said that is bad for her community. She has lived on Kingwood Pike for over 40 years and said their traffic problems stem from WVU. She thinks the money would be better spent on traffic issues in town.
458	Documentation of call by WVDOH: Sasha is a Kingwood Pike resident and is very concerned about the project and thinks other alternatives need to be considered, besides the roundabout. I directed her to the public meeting page with the alternatives analysis, project plans, and project info. She thinks there is too much development already and the project doesn't make sense. I told her that was the reason for the project, to address the development in the area. She is extremely concerned with the project taking valuable farmland in the area, that has been used for the greater good of the community. She said there would not be as much reaction time with the roundabout vs stoplight and was concerned with ice during the winter and traffic issues. She is concerned about issues with standing water on parts of the project, as well as the road in front of the project falling over the bank. She said there have been repairs on this section, but they keep failing. The roundabout is a major concern. She said that speeding is very problematic there and was concerned that the roundabout would not address the problem, like a stop light or turn lane would. Also she is concerned with truck traffic in the area, with respect to the roundabout. The detour was a huge concern as well. She said that Aaron's Creek Road was very dangerous as is, and would not be a safe detour for anyone, much less the amount of traffic being detoured for the Greenbag Rd project.
459	No round about
460	No roundabout - Will hamper traffic into my business - Ruins a small local farm's business (on the corner of Dorsey and greenbag - Increased truck traffic noise impact the serenity of our spa (hurts another small local business). A few more stop lights would be helpful for flow but round about not needed.
461	As someone who lives right off of Dorsey and uses both intersections regularly, I admit that something needs to be done. Roundabouts are NOT the answer though. I think that the Dorsey/Greenbag/Kingwood Pike intersection would be best served by adding turn lanes and turning signals (what I had hoped for when the lights were installed to replace the 4 way stop years ago). At the South/MTEC Drive "T", I don't typically see an issue there except for at the beginning and end of a school day and there are traffic patrols keeping things moving then. Definitely does not necessitate adding a roundabout in my opinion as I have entered the T from all directions in the past and it was a non-issue. Please do not

	go with adding 2 roundabouts (& this is coming from someone who does see the value and knows that roundabouts are good at traffic control, but it is NOT needed in this case.) Thank you!
462	I don't see a pressing reason for a roundabout at this intersection. The tax dollars have other pressing needs that need to be addressed immediately.
463	I drive the kingwood pike to work every day and back. I do not have a problem with the intersection as it is, however I do have a problem with the city taking from the Hasting's family farm which would impact their business - Joy and Hemp Universal LLC.
464	Environmental Assessment (EA) has not identified a significant portion of Prime Farmland/ Farmland of Statewide Importance located on our property (Map 48, Parcel 10 & 11, and Map 10, Parcel 54.10), where Option F of the EA analyzes a roundabout traffic pattern. The current EA version available to the public for comment is incorrect with regard to the following: - The Prime Farmland soil determination for the existing condition of the lands within the limits of disturbance for the Hastings property (Map 48, Parcel 10 & 11, and Map 10, Parcel 54.10) is confirmed and can be found via the USDA NCRS - Web Soil Survey. - In accordance with Federal Land, a Land Evaluation Site Assessment must take place as stated by Farmland Protection Policy Act. - The EA incorrectly describes my farmland as disturbed previously. Which is incorrect. -This land has, and continues, to be farmed by me, in addition to other farmers, some of which who rent, as well as, one limited liability corporation, and one Non-Profit designated 501c3, all of which participate in agricultural practices and activities in that location. I, Mary E. Hastings, as landowner and Agricultural business owner formally request that the EA to be amended and reassessed to accurately reflect potential significant impact to the Hastings (Map 48, Parcel 10 & 11, and Map 10, Parcel 54.10) and other lands that may also be incorrectly assigned improper land use and/or other incorrect designation of farmland of importance according to the USDA NRCS Soil Survey located within the Limit of Disturbance for the proposed project in all alternatives. I, Mary E. Hastings, as land owner and person directly affected by the effects and impacts of the proposed actions in the WVDOH Greenbag Road Project EA, request additional Public Comments after the correction as to accurately reflect the demographic and public opinion of Option F.
465	Against the roundabout
466	This is ABSURED!!! No reason at all for a round about to be placed here, there is no safe detour route I do not feel safe on the roads they are so called using for detouring, I would have to go at least 10-15 minutes out of my way to get to my job to make a living and then on top of that have to put extra money into my gas tank for the extra driving, and extra money in maintenance because im not sure the last time anyone making these decisions drove on arrons creek road or summer school road but they are not fit for a dog to walk down let alone drive a vehicle!! arrons creek is not big enough to pass two cars through let alone all these hillbilly pickup trucks and a tiny car, you take a hint of which one will end up in the ditch at winter time on untreated roads!I dont know the family very well, that own the farm land you are wanting to take and destroy but I do know thats their livelihood and by you taking that away from them could cause them to loose everything!!!they also support surrounding area farmers that use that land for their livelihood as well and you could cause many families to loose everything they worked so hard for all their lives, how SELFISH of you if you go on with this!!! your uprooting everyones lives that live on the kingwood pike and surrounding areas and wasting so much money on this project when you could save it all just by simply flipping a switch and letting the light change on each side one at a time you dont even need a turning lane or turning light, then you can use all the money to fix the kingwood pike. The pike bridge is government funded so theres your money for that and then you can fix the bridge that you can look through and see the

	interstate below!! These people in the big offices its time to start thinking about the people you said you'd support and listen to when you were running for office ,nows your time to prove yourself, listen to the people we know what we are talking about believe it or not!!!
467	I'm appalled. Furious and beyond troubled over today's Dominion Post article. I want to know who gives the commission the right to approve the round about project! We the tax payers should have the say! The residents thats lives will be turned upside down! There's no good detour and if you think there is than I invite you to come take a tour with me on Aaron's Creek and Cobun Creek roads! Do you even care for the welfare of the children that will be on a bus on those unsafe, narrow roads? The trucks, commuter traffic and construction vehicles that will need to find alternative routes so this unnecessary, unwanted project happens? This is unfair! Let the tax payers vote! We oppose this plan! We deserve to be heard!
468	A roundabout is unnecessary on the Greenbag road. A turn lane, or even just a green arrow would be perfectly fine. A roundabout would be a waste of money and resources that would be better spent elsewhere. Also using Aaron's Creek Road or Cobun Creek Road to detour all the traffic on the Kingwood Pike is impractical. They are far too narrow and of poor quality to handle that much traffic.
469	I reject the proposal for the roundabout on greenbag road the detours are unfit for the amount of traffic detoured too many trucks take the pike and 4way intersection ridiculous to uproot working farms all to receive federal funding if you federal funding use it to fix the pike bridge roundabouts dont belong in this rural area they belong in big cities stop making unnecessary changes all we need is a turning lane this project will disrupt the lives of too many people for too long because we know this is a several year project listen to the people who drive this everyday dont listen to those who sit behind a desk and make things look good on paper thank you
470	I am appalled at the ridiculous idea of the round about at the bottom of the Kingwood Pike. It isn't needed! There are other options to improve the traffic flow that would not mar the beautiful country setting, destroy the farmland, and waste a fortune of money putting in a round about. Who wants this ??? Not the people who reside on the Kingwood Pike who travel that intersection, so who wants it? I live on the Kingwood Pike. Rerouting traffic on Aaron's Creek for the long duration of the project is hazardous. What about when an ambulance needs come to us, other VFD units, our school buses!! Listen to the people please!!
471	No
472	No
473	In continuation of my previous comment, Numerous mischaracterizations have been identified in the EA during the public comment period. The architectural and archaeological reports completed in anticipation of the proposed Greenbag Road project are flawed and lack the proper level of detail to adequately document the significance of the resources in the vicinity of the project area. We request additional time from the SHPO and the WVDOH to do proper STPs on the location impacted by the current project design in anticipation of findings. As previously described, numerous artifacts of a historic and prehistoric nature have been found and documented on the land directly impacted. We are requesting more time in the name of preservation to provide additional information to better information the project team and community

	on the potential irreversible impacts. In good faith, the community is funding an independent archaeology dig and plans to begin ASAP.
474	I oppose the roundabout at the green bag road intersection. It is unnecessary and will disrupt the Hastings farm land.
475	Please reconsider your decision on this matter. We need other roads fixed. Don't fix something that's not broken. Roundabouts are dangerous and never should be put in.
476	Why on earth would you take land that has been in someone's family for so long just to build a roundabout for an intersection that already works. This intersection has worked for years even when it was a 4 way stop sign. Stop trying to "improve" it just because you think it's going to be better. A roundabout is just going to cause more congestion like the mileground.
477	Placing a roundabout on Greenbag Rd is not a good idea and will not deter trucks from driving through town. The Kingwood Pike is not only dangerous but crumbling apart, money could be better spent on other projects such as fixing the roads with heinous pot holes in them.
478	Waste of money to put a round about on the Greenbag Road. There is not a lot of traffic on that road. And not to mention having no regards to what the land owners have to say. Basically stealing their land. This county is so greedy. The truck traffic will still go through town no matter what, they won't be forced to go Greenbag road. If this was any county commissioners land, I guarantee this project would not be happening.
479	I do not feel as though a roundabout at the bottom of the Kingwood Pike is necessary or safe. There is absolutely no need to take people's land to create a more dangerous intersection. While I understand there 10 million dollars available, I feel as though that money would be better spend reinforcing the part of the road that continuously slides and eventually separates. Ensuring the safety of the road and the citizens who travel it daily is more important that building a 10 million dollar roundabout. While I acknowledge there are certain points throughout the day where there can be a backup at that light, traffic would move more efficiently if the intersection reverted back to a 4 way stop or a turning lane was created.
480	I appreciate and applaud everyone's hard work balancing the many interests on this project. It is a very important one for the future of the Morgantown region! As noted in the main page for this project: "Community involvement in the development of the Morgantown Monongalia Planning Association (MMMPO) Greenbag Road Corridor Study (2015) identified pedestrian facilities to connect the neighborhood schools with the commercial and residential areas as a key issue for community safety and access." While I applaud the DOH's work to include pedestrian infrastructure and some bike accommodations on the western half of the project, to not connect hundreds of residents and multiple businesses on the east side of Mountainview is contrary to that statement, and I hope the DOH will strongly reconsider the design from the Dorsey intersection eastward. I'd like to respectfully submit these points for consideration in the design: 1) sidewalk the entire length of the project on the north side of Greenbag is a good option for pedestrians, though a multi-use path would be much safer and encouraging for the average pedestrian or bicyclist 2) I fully support the sidewalk as designed on the east side of Dorsey, connecting Greenbag to Luckey Lane and Mountainview ES 3) I fully support the sidewalk on Luckey Lane, but would like it to extend the entire length of Luckey Lane 4) I fully support the roundabouts as designed. I hate to see the loss of land for the community farm but understand why that is the chosen alternative 5) <<From Dorsey intersection to the east>>: the lack of ped/bike infrastructure on this section of the project is a major concern and contrary to

	public feedback as noted above. Thus, I strongly recommend (a) a 5' sidewalk on the north side of Greenbag + paved shoulders or bike lanes on both sides, or (b) preferably, a 10-12' multiuse path on the north side of Greenbag from the Dorsey intersection to the eastern terminus of the project to connect the schools to hundreds of residents in the housing developments that are accessed from Jonathon Lane, Ashworth Lane, and Long Branch Drive. ---Alternatively, if the Luckey Lane to Dorsey Ave section is absolutely impossible for ped/bike infrastructure along Greenbag, at a minimum a sidewalk or multiuse path is requested from the Luckey Lane intersection w/Greenbag to the eastern terminus of the project 6) <<From Dorsey intersection to the west>>: I appreciate the bicycle accommodations (3-4' shoulders), but those will be very uncomfortable for the average bicycle rider because of the proximity to high speed and volume of traffic (I've ridden that stretch with my 11 year old son, so we know). I'd ask that an alternative be considered that could support both pedestrians and bicycle riders ---> a 10-12' multi-use path, separated from the road (rather than the ~12' of paved shoulders & sidewalk that are currently proposed from the Dorsey intersection, westward) 7) <<From Dorsey intersection to the west>>: I strongly recommend a safe pedestrian crossing from the western terminus of the sidewalk on the north side of Greenbag (near the Goodyear Auto building) to the south side of Greenbag (Giant Eagle/mall) - a HAWK signal is a good recommendation. This could serve significant community interest in connecting White Park by trail to Dorsey's Knob park & trails. To summarize, pedestrians and bicyclists of all ages and skill levels should be supported along this <entire project corridor>, ideally with a 10-12' multi-use path separated from traffic on the north side of Greenbag, alternatively by using a sidewalk and two paved shoulders. I greatly appreciate the opportunity to comment on a project that will have a major impact on our area for decades. Many of us have been working for improvements throughout the entire region for pedestrians and bicyclists, and this corridor is a critical piece of the puzzle. Thank you!
481	Round about is a waste of time and money! Fix the potholes! And have you seen arrons creek, a detour on that road will be an absolute joke.
482	I've been using Kingwood Pike and Greenbag Rd for 40+yrs and up until the red light was added have never had problems at the 4 way intersection. Everyone kindly took turns to go and no problems turning left. Now it's a dangerous race to go left when other car is going left and people go around those cars turning left. Not impressed with roundabouts as Mileground has proven not successful during rush hr. If roundabout goes thru we will be forced for awhile to use dangerous Aaron Creek Rd. This rd is in bad shape and narrows to a single lane towards Kingwood Pike. No room to barely pull over to approaching cars. Then there's the fact that it will take us a longer route just to go to Gisnt Eagle, etc. How long will this detour be used? Progress sometimes hurts those citizens that use it the most.
483	The kingwood pike needs on and off ramps to the i68 over pass that would take away a lot of your traffic. Everyone now has to use the 4way/ green bag road because their is no other routes suitable to drive to get to upper kingwood pike/ Preston county. If you put in the on and off ramps you will not get much traffic at all on green bag road. Round about will be a disaster if a wreck would happen at either giant eagle intersection or the next intersection would be a major traffic jam in and between the roundabouts. Monongalia county has to many ways in and not enough routes out.
484	Please install a crosswalk and appropriate signage on Greenbag Rd at the Eastern entrance to Mountaineer Mall, connecting White Park trails to the trails on Dorseys Knob.
485	Please consider pedestrians, inlcuding crosswalks at intersections. The improvements to trails in White Park and Dorseys knob. It would be great to connect them. Please follow Complete Streets.

486	The proposed project lacks a key element--a pedestrian crossing from the north side to the south side of Greenbag Rd! The plan should be amended to include this element. In addition, a multi-user side path that extends the entire length of the project area is preferable to a sidewalk --a side path will facilitate use by cyclists, not just pedestrians while providing a SAFE route for children to walk or bike to school. Finally, roundabouts offer many benefits. However, community needs may be better served by relocating the roundabout at the intersection of Greenbag, Dorsey, and the Kingwood Pike to preserve the community garden.
487	Please provide a pedestrian crossing on Greenbag Road, near Giant Eagle, that will provide access from the trails in White Park, to not only the Giant Eagle grocery store, but also to Dorsey's Knob Park and Sky Rock. I am asking for the pedestrian crossing only. The connector trails will be built by the Greenspace Coalition, the City of Morgantown, and other local entities.
488	A roundabout at intersection of Green bag Rd and Kingwood pike is not needed and a big waste of Taxpayers money. A turning light is all we need. If they didn't need the Roundabout in Sabraton why would we need one on our little country road? Also the idea of Big trucks as well as so many cars detouring over Cobun Creek is a horrible idea! It is a one lane dirt road in most places. Ty
489	There is no need to waste money on a roundabout. Put in a passing lane like you did in Sabraton. The money you would save you can put an on and off ramp to Interstate 68 up at the pike bridge. Most truckers and people driving the pike need to get on interstate any way. Of course this would be too simple. How much is it gonna cost to make Aaron creek road usable for the additional traffic
490	My name is Steve Runfola and my family neighbors and I must use Cobun Creek Road to access our homes. We understand that Cobun Creek Road will be used as a detour for the many months or years of Green bag Road roundabout construction. My neighbors and I are very concerned that Cobun Creek as it exists now is seriously unprepared for heavy 2 way traffic that will include large trucks and other heavy vehicles. The DOH has posted a sign at the intersection of Cobun Creek and 119 stating that heavy vehicles are banned on this road. It may be knocked down at the moment but it should be there. The road is one lane with no pullovers and has terrible drainage in many places. You can literally watch while moderate to heavy rains rip this road apart and turn it into a real creek or sheet of ice. Any maintenance done on the road is destroyed in a matter of weeks due to the atrocious drainage. What are the plans for this road before, during and after the Roundabout construction? We also think it's a very good idea if The County and the DOT contact us if our area is to be directly impacted by major maintenance or construction. None of us had any idea that Cobun Creek may be used as a long-term detour and so no one that I know of attended the Roundabout meetings. My name and contacts are Steve Runfola M: 1-304-680-1340 Email: StevenRunfola@Gmail.com . Thank you for your service and have a good day.
491	If there is an intent to use Cobun Creek Road as a detour for any traffic as a result of this project, than we have a significant objection to the plan. We live on this road and it is already in very poor condition. It is very narrow with no ability to pull off/have 2-way traffic in most areas. The drainage is poor and causes wash outs and potholes after any major rain. During the winter, the road is poorly maintained and often is very icy as a result of poor drainage. Repairs to the road often last only a week or so because of the poor drainage, as well. The existing traffic, along with the dam construction traffic, already makes traveling this road difficult throughout the day. There are deep ditches which add to the challenge of the narrow road. It has already been deemed not suitable for large trucks and, honesty, is barely suitable for any vehicle. In fact, school buses will no longer even come down this road. In the ~15 years I have owned property off this road, it has consistently gotten worse each year. Added traffic would be unacceptable and would make it extremely unsafe and troublesome to the residents who must use this road.

492	Thank you for the opportunity to comment. I am opposed to the state plan to put a roundabout on Greenbag Road near the Kingwood Pike. This roundabout is unnecessary are unfairly takes a large part of a local family's cooperative farm. Money that would be spent for this project could be better applied by creating and maintaining sidewalks and improving existing roadways.
493	I am writing to state my opposition to the proposed plans to install two unnecessary roundabouts on Greenbag Road. These projects are a waste of taxpayer dollars. There are countless better uses for state money, including improving existing sidewalks, building new sidewalks, and improving existing roadways. Further, this project unfairly disrupts and takes away valuable land from the Hastings cooperative farm, which has existed for many years in Morgantown. No to these unnecessary roundabouts!
494	How in the hell are log trucks and extra long RV's supposed to head up/or down the pike with a round about.
495	I even sent Tom Bloom a message and he said they can't turn back.i said take the lights down put stop signs back up or just put in turning lane .this so sad il think people should have a vote on it .
496	Or just let one side go at a time and no road work needs done at all save the money to fix the pike!! I think its time to protest everyone else can over every little thing so why not us!!!!!
497	Fix our roads!!!that is so stupid!!!!!
498	Fix the roads we already have you would be better off.
499	Can't wait when it snows and we come off the Pike into a roundabout! (SARCASM)
500	Why pay property taxes, they just take your land anyway... sad
501	No one wants this. I've sent many messages, emailed, texts etc. i wrote an email to Joe Statler it was returned as undelivered and not accepted through his server. I'm printing and mailing the same letter tomorrow. No one wants this.
502	I've seen cars)trucks slide right through the intersection
503	They make money from every roundabout the build
504	It would be cheaper to just put in lights with an arrow, and put the money on fixing the pike, common sense, if they just knew how to use it, common sense .
505	I live 3 miles up the Pike. I think all is needed us a turning lane. Why spend all that money on something not needed and take someone's land. Smh
506	A turning lane was promised years ago. Never happened. Why we can't even get any potholes fixed. Nothing all summer — not even the big crater as you start up the Pike
507	What's the point in even voting for not putting this in if they're not going to even consider our opinions??!!!! This is a bunch of bull! They already had this set up and there isn't anything that anyone can do or say to change it, apparantly!!!!! I guess what the people want doesn't matter, unless you make it about racism or something!
508	Just fix the road don't need a roundabout on a pike
509	Why can't they just change the light to a four way stop like at the glenmark center
510	Have they driven Aaron's Creek for their detour. I mean really. you cant pass. How are buses suppose to travel it
511	Wait til busses all go arrons creek! That will be at least 25 extra mins. On a good day! If they still plan on the same work schedule of detours! What is wrong with a guarded arrow??

512	Check out the round about in Granville.millions of dollars and its coming out. Fix the roads we already have or put in a exit ramp for king wood pike off interstate
513	Fix the road not everybody happen ride down the Creek Road
514	I'd like to see how Corbin creek road is going to handle the traffic. You can't even pass on it now let alone all the truck traffic.'put an on and off ramp to interstate at the bridge. Cost a hell of lot less than the round about. But of course the commission is probably guaranteed a pocket full of $$$
515	Just wait until an ambulance is needed on the Pike and they have to travel Aaron's Creek to get here. Or help from other VFDs. Someone is benefiting from this ridiculous plan 💵
516	Pike is awful all the way up. Rough road! Also I've seen cars slide through intersection. And Cobun Creek us very very narrow. Hard to pass I a good day
517	Why dont we put a roundabout in the commissioners' neighborhoods? I bet they would stop that real quick.
518	The repairs to our roads is much needed. They are horrible. Since it is tax payers money , the people need to be heard. If they want to put a roundabout somewhere put it on 705at the Stewartstown rd. Leave the country rds. Alone.
519	People should be able to vote on this, roundabout, left turn signal light or leave it alone! My thought is leave it alone or left turn lights
520	The roundabout is a joke.These engineers don't have common sense. Just like on the mileground, the people coming from milan and hospital don't even yeild, they plow right through.
521	The engineers don't understand human nature or this area. It's not the usual excuse they always give... "people will "learn" the roundabout". Oh, they know the rules and don't care. I can't count the times I have been passed on a double yellow line on the Pike when I am going at or above the speed limit. The stop light is the only thing they stop for. Can you imagine what a roundabout here will be like?
522	those educated engineers have no idea. Bet they have never driven up the pike or looked into any alternative methods. They have their minds and pockets set on the roundabout and don't care about the people who live here. Let's just remember this the next election
523	All the hell it needs is a damn turning lane . And fix the freaking part that's been falling in for years . What good a round about when there's no road to travel on the pike .
524	We do not need a round-a-bout on the Green Bag Road. A turning lane... and a left-turning light at the intersection onto Dorsey would alleviate the traffic congestion. Why put all that money into something that is not needed and costs so much money and also takes private land?
525	YALLdon't even have a plan for drainage or re routing the creek. THE plan is design and build once it's approved. This whole project is nothing but issues and red flags all over.....
526	The proposed roundabout is a major waste of taxpayer money. Turning lanes and lights with arrows would be a simpler, more effective solution. A roundabout will change the look of the area for the worse. Leave the farmlands alone.
527	There wanting to take the old Farm!!
528	we do not need this
529	Time to vote out commissioners! They're suppose to work FOR us, not against us.
530	My name is Steve Runfola and my family, neighbors and I must use Cobun Creek Road 119/6 to access our homes. I have been reading your Greenbag Road EA.August 2020 document and I see that Aaron's Creek Road is named as a possible Detour for The GreenBag Roundabout project yet Cobun Creek Road is not named as a possible detour for the project. Cobun Creek Road is about 3 miles long and connects

	Kingwood Pike and Grafton Road. The Grafton Road/Cobun Creek intersection is about 50 yards from the Kingwood Pike bridge over I68. The Grafton Road/Cobun Creek intersection is next to Allied transfer and storage about 1 mile from Walmart. It is impossible for my neighbors, family and I to believe that Cobun Creek Road will not be used as a defacto detour during roundabout construction. People will use this road heavily no matter if it is an official detour or not. In the past we have all seen it used heavily for brief periods as a detour during road construction and automobile wrecks. My neighbors and I are very concerned that Cobun Creek road as it exists now is seriously unprepared for heavy long-term 2 way traffic that will include large trucks and other heavy vehicles. The road is one lane with no pullovers and has terrible drainage in many places. You can literally watch while moderate to heavy rains rip this road apart and turn it into a real creek or sheet of ice. Any maintenance done on the road is destroyed in a matter of weeks due to the atrocious drainage. What are the plans for this road before, during and after the Roundabout construction? We also think it's a very good idea if The County and the DOT contact us if our area is to be directly impacted by major maintenance or construction. None of us had any idea that Cobun Creek may be used as a long-term detour and so no one that I know of attended the Roundabout meetings. My name and contacts are Steve Runfola M: 1-304-680-1340 Email: StevenRunfola@Gmail.com . Thank you for your service and have a good day. Steve Runfola
531	While I applaud the DOH's work to include pedestrian infrastructure and some bike accommodations on the western half of the project, to not connect hundreds of residents and multiple businesses on the east side of Mountainview is contrary to that statement, and I hope the DOH will strongly reconsider the design from the Dorsey intersection eastward. I'd like to respectfully submit these points for consideration in the design: 1) sidewalk the entire length of the project on the north side of Greenbag is a good option for pedestrians, though a multi-use path would be much safer and encouraging for the average pedestrian or bicyclist 2) I fully support the sidewalk as designed on the east side of Dorsey, connecting Greenbag to Luckey Lane and Mountainview ES 3) I fully support the sidewalk on Luckey Lane, but would like it to extend the entire length of Luckey Lane 4) I fully support the roundabouts as designed. I hate to see the loss of land for the community farm but understand why that is the chosen alternative 5) <<From Dorsey intersection to the east>>: the lack of ped/bike infrastructure on this section of the project is a major concern and contrary to public feedback as noted above. Thus, I strongly recommend (a) a 5' sidewalk on the north side of Greenbag + paved shoulders or bike lanes on both sides, or (b) preferably, a 10-12' multiuse path on the north side of Greenbag from the Dorsey intersection to the eastern terminus of the project to connect the schools to hundreds of residents in the housing developments that are accessed from Jonathon Lane, Ashworth Lane, and Long Branch Drive. ---Alternatively, if the Luckey Lane to Dorsey Ave section is absolutely impossible for ped/bike infrastructure along Greenbag, at a minimum a sidewalk or multiuse path is requested from the Luckey Lane intersection w/Greenbag to the eastern terminus of the project 6) <<From Dorsey intersection to the west>>: I appreciate the bicycle accommodations (3-4' shoulders), but those will be very uncomfortable for the average bicycle rider because of the proximity to high speed and volume of traffic (I've ridden that stretch with my 11 year old son, so we know). I'd ask that an alternative be considered that could support both pedestrians and bicycle riders ---> a 10-12' multi-use path, separated

	from the road (rather than the ~12' of paved shoulders & sidewalk that are currently proposed from the Dorsey intersection, westward) 7) <<From Dorsey intersection to the west>>: I strongly recommend a safe pedestrian crossing from the western terminus of the sidewalk on the north side of Greenbag (near the Goodyear Auto building) to the south side of Greenbag (Giant Eagle/mall) - a HAWK signal is a good recommendation. This could serve significant community interest in connecting White Park by trail to Dorsey's Knob park & trails. To summarize, pedestrians and bicyclists of all ages and skill levels should be supported along this <entire project corridor>, ideally with a 10-12' multi-use path separated from traffic on the north side of Greenbag, alternatively by using a sidewalk and two paved shoulders.
532	From the Dorsey Intersection East, there needs to be a sidewalk or multi-use path on the northside of Greenbag to accommodate all residents to safely travel to Mountainview Elementary and South Middle School. If a sidewalk had been present, my kids would have walked to and from school and never ridden a bus. As a resident, I see hundreds of families walking along Greenbag to get to work/shopping in Sabraton or the Family Dollar on Lucky Lane and it is horrifying because strollers are being pushed, toddlers and teens are walking. My husband bicycles to work and I fear for him biking on Greenbag Road as the massive amount of traffic at high speeds. The gravel trucks travel at speeds well above the speed limit and traffic consistently crosses the middle yellow line at the curve in front of our development. I support Option D at Mississippi Ave to give as many lanes as possible for this. I would not support the round about at Dorsey/Kingwood Pike. I think dedicated turn lanes is enough, as well as a turn signal in all directions to keep traffic from backing up. I appreciate the feedback opportunity and believe that the entire Greenbag Corridor should be expanded all the way to Sabraton for the safety of pedestrians and bicyclists.
533	1) sidewalk the entire length of the project on the north side of Greenbag is a good option for pedestrians, though a multi-use path would be much safer and encouraging for the average pedestrian or bicyclist 2) I fully support the sidewalk on Luckey Lane, but would like it to extend the entire length of Luckey Lane and suggest design of a multi-use path as in this location as the better alternative. 3) <<From Dorsey intersection to the east>>: the lack of ped/bike infrastructure on this section of the project is a major concern and contrary to public feedback and incomprehensible in light of the state's Complete Streets Legislation. Thus, I strongly recommend a 10-12' multiuse path on the north side of Greenbag from the Dorsey intersection to the eastern terminus of the project to connect the schools, LOCAL BUSINESSES, and to hundreds of residents in the housing developments that are accessed from Jonathon Lane, Ashworth Lane, and Long Branch Drive. ---Alternatively, if the Luckey Lane to Dorsey Ave section is absolutely impossible for ped/bike infrastructure along Greenbag, at a minimum a multiuse path is requested from the Luckey Lane intersection w/Greenbag to the eastern terminus of the project

	4) <<From Dorsey intersection to the west>>: I appreciate the bicycle accommodations (3-4' shoulders), but those will be very uncomfortable for the average bicycle rider because of the proximity to high speed and volume of traffic. A 10-12' multi-use path, separated from the road (rather than the ~12' of paved shoulders & sidewalk that are currently proposed from the Dorsey intersection, westward) 5) <<From Dorsey intersection to the west>>: I strongly recommend a safe pedestrian crossing from the western terminus of the planned sidewalk, which would be much more useful to all as a multi-use path, on the north side of Greenbag (near the Goodyear Auto building) to the south side of Greenbag (Giant Eagle/mall) - a HAWK signal is a good recommendation. This could serve significant community interest in connecting White Park by trail to Dorsey's Knob park & trails. To summarize, pedestrians and bicyclists of all ages and skill levels should be supported along this entire project corridor with a 10-12' multi-use path separated from traffic on the north side of Greenbag,
534	1) sidewalk the entire length of the project on the north side of Greenbag is a good option for pedestrians, though a multi-use path would be much safer and encouraging for the average pedestrian or bicyclist. Plus multi-use paths make much better use of limited space and serve the community best. 2) I fully support the sidewalk on Luckey Lane, but would like it to extend the entire length of Luckey Lane and strongly suggest design of a multi-use path as in this location as the better alternative. 3) From Dorsey intersection to the east, the lack of ped/bike infrastructure on this section of the project is a major concern and contrary to public feedback and incomprehensible in light of the state's Complete Streets Legislation. This is a rare opportunity for an infrastructure investment of this magnitude and the failure to accommodate a multi-use path along the entire project corridor, even if it means narrowing automotive land widths, stands as a major misstep that could and should be corrected. As a multiple business owner and employer of 15 (including myself) situated along the project corridor at 911 Greenbag Road, I strongly recommend a 10-12' multiuse path on the north side of Greenbag from the Dorsey intersection to the eastern terminus of the project. This would allow a much desired bicycle and pedestrian commuter corridor that has served as a blockage to my entire staff that desires this to be a safe means of travel and remove continued reliance on motorized means of transport. It's a critical path to connect the schools, LOCAL BUSINESSES, and hundreds of residents to existing infrastructure (bicycle route along Diamond Avenue with connection to the Decker's Creek Rail Trail). Alternatively, if the Luckey Lane to Dorsey Ave section is absolutely impossible for ped/bike infrastructure along Greenbag, at a minimum a multiuse path is requested from the Luckey Lane intersection w/Greenbag to the eastern terminus of the project 4) <<From Dorsey intersection to the west>>: I appreciate the bicycle accommodations (3-4' shoulders), but those will be very uncomfortable for the average bicycle rider because of the proximity to high speed and volume of traffic. A simple test is whether you would you allow your own children to ride a bike on that corridor? A 10-12' multi-use path, separated from the road (rather than the ~12' of paved shoulders & sidewalk that are currently proposed from the Dorsey intersection, westward)

	5) <<From Dorsey intersection to the west>>: I strongly recommend a safe pedestrian crossing from the western terminus of the planned sidewalk, which would be much more useful to all as a multi-use path, on the north side of Greenbag (near the Goodyear Auto building) to the south side of Greenbag (Giant Eagle/mall) - a HAWK signal is a good recommendation. This could serve significant community interest in connecting White Park by trail to Dorsey's Knob park & trails. To summarize, pedestrians and bicyclists of all ages and skill levels should be supported along this entire project corridor with a 10-12' multi-use path separated from traffic on the north side of Greenbag. We cannot miss the opportunity of this significant investment to bring a non-motorized corridor connecting all of these essential community assets.
535	Thank you for addressing the Green Bag Road in Morgantown. I strongly support the development of the Morgantown Monongalia Planning Association (MMMPO) Greenbag Road Corridor Study recommending pedestrian facilities to connect the neighborhood schools with the commercial and residential areas. Safety and access are of paramount importance. Both pedestrian infrastructure and accommodations on the western half and the Eastern half of Mountainview connect hundreds of residents and multiple businesses, I hope the DOH will strongly reconsider the design from the Dorsey intersection eastward. Further, I recommend/note: 1) a sidewalk the entire length of the project on the north side of Greenbag for pedestrians. A multi-use path would be much safer and encouraging for the average pedestrian or bicyclist 2) the sidewalk as designed on the east side of Dorsey, connecting Greenbag to Luckey Lane and Mountainview ES 3) the sidewalk on Luckey Lane extending the entire length of Luckey Lane 4) the roundabouts as designed. 5) the lack of ped/bike infrastructure on Dorsey intersection to the east is a major concern. a) I strongly recommend a 5' sidewalk on the north side of Greenbag plus paved shoulders / bike lanes on both sides, or b) a 10-12' multiuse path on the north side of Greenbag from the Dorsey intersection to the eastern terminus of the project to connect the schools to hundreds of residents in the housing developments that are accessed from Jonathon Lane, Ashworth Lane, and Long Branch Drive. ---Alternatively, if the Luckey Lane to Dorsey Ave section is absolutely impossible for ped/bike infrastructure along Greenbag, at least a sidewalk or multiuse path from the Luckey Lane intersection w/Greenbag to the eastern terminus of the project 6) the bicycle accommodations (3-4' shoulders) from Dorsey intersection to the west will be very uncomfortable for the average bicycle rider (I am 78 years of age but bike all around the city and region) because of the proximity to high speed and volume of traffic. An alternative could support both pedestrians and bicycle riders, namely a 10-12' multi-use path, separated from the road 7) a safe pedestrian crossing from the western terminus of the sidewalk on the north side of Greenbag (near the Goodyear Auto building) to the south side of Greenbag (Giant Eagle/mall) - a HAWK signal is a good recommendation. This could serve significant community interest in connecting White Park by trail to Dorsey's Knob park & trails. To summarize, pedestrians and bicyclists of all ages and skill levels should be supported along this entire project corridor, ideally with a 10-12'

	multi-use path separated from traffic on the north side of Greenbag, alternatively by using a sidewalk and two paved shoulders. I have worked on pedestrian and bicycle infrastructure since 2004. This corridor is critical.
536	I support the development of MMMPO Greenbag Road Corridor Study to enhance pedestrian, bicycle accommodations to safely connect schools with commercial and residential areas. The entire length of the Greenbag road must be included. I recommend: - a sidewalk (prefer a multi-use path) the entire length of the project on the north side of Greenbag for pedestrians. - sidewalk connecting Greenbag to Luckey Lane and Mountainview Elementary. - sidewalk extending the entire length of Luckey Lane - the roundabouts as designed. - you address the lack of ped/bike infrastructure on Dorsey intersection a) Suggest a 5' sidewalk on the north side of Greenbag plus paved shoulders / bike lanes on both sides, or b) a 10-12' multiuse path on the north side of Greenbag from Dorsey intersection to the eastern terminus of the project ----------Or, at least a sidewalk or multiuse path from the Luckey Lane intersection w/Greenbag to the eastern terminus of the project - the bicycle accommodations (3-4' shoulders) from the Dorsey intersection to the west will be dangerous and daunting for the average bicycle rider given the high speed and volume of traffic. An alternative could support both pedestrians and bicycle riders, namely a 10-12' multi-use path, separated from the road - a safe pedestrian crossing from the western terminus of the sidewalk on the north side of Greenbag (near the Goodyear Auto building) to the south side of Greenbag (Giant Eagle/mall). This will serve community members wishing to connect White Park by trail to Dorsey's Knob park & trails. All pedestrian and bicyclist travel should be supported along this entire project corridor, ideally with a 10-12' multi-use path separated from traffic on the north side of Greenbag, alternatively by using a sidewalk and two paved shoulders. This safe and efficient corridor is critical to transportation and quality of life in the region.
537	I don't think they should put a roundabout off king wood pike fix the roads we have! Round about will just take more farm land!
538	"Overall I feel this is a poor design, and other alternatives should have been provided to the public, and for comment." - Public Comments, May 2019. I agree with previous comments made last year. Now, in 2020, the evidence presented in the Environment Assessment is not sufficient as to reinforce why hundreds of comments received asking for turning lane alternatives were not analyzed. Please describe. Thank you.

539	Additional comments encouraging productive and enjoyable harmony between human and the environment: The vast majority of design related public comments from May 2019, desired additional turning lane options at Kingwood Pike/Greenbag Rd intersection. The public sited numerous reasons why this should be analyzed further including line-of-sight design, direct and easy-to-understand traffic flow, trucking and commuter safety, considerable grade incline approaching Greenbag Rd from Kingwood Pike, trucking load shift, design-build associated risks, geographical slip topography, and lessening impacts to valued community assets (natural resources, businesses, and residences). Due to the high numbers of comments submitted last year asking for turning lane options, and the consideration that was granted by WVDOH for these options, but not the analysis, we formally and humbly request analysis of the hybrid turning lane options (further described below) that were alternatives requested last year, 2019 and demanded this year, 2020. A collection of public comments submitted April 2019 and October 2020 suggest a turning lane option at Kingwood Pike/Greenbag Rd summarized as “Hybrid Option E” or “Hybrid E." Hybrid E would combine Option D (for the Dorsey Avenue and Kingwood Pike approaches) with Option E (for the Greenbag Road approaches) addressing high level traffic concerns while, 1.) not displacing any residences or businesses or non-profits, 2.) preserving prime farmland with significant cultural and natural resource importance, including the home of Conscious Harvest Cooperative Community Garden, 501(c)3 Non-Profit; Joy And Hemp Universal LLC, WVDA Permitted Hemp Farm; the 118 year running heritage family farm - Hastings Family Farm; and Mockingbird Hill Farms agricultural production plots, 3.) Valuing geographic topography of region and lessons-learned experience with previous road projects (public comment #25 by impacted landowner), and 4.) Reducing the amount of impervious surface, causing fewer impacts to nearby streams and wetlands. This alternative suggested by the public should be considered during this point in the NEPA process to better inform the public and decision makers from here forward.
540	Substantial comments have been made advocating and acknowledging important community, cultural, and natural resources directed impacted and destroyed by the Option F. What is meaningful public involvement when information on impacts are not recorded in the potential impacts table? Why were these impacts excluded in the tables and descriptions therefore resulting poor information available to government agencies for decision-making?
541	THIS IS MY FIRST comment. The comment period is unacceptable. This meeting was poorly communicated to the greater morgantown community...a virtual meeting ? i do not consider this "meeting how does this " virual " program meet the state mandated parameters ..... for public notices and comments i.e.....as., demonstrated . .the public forum as held 16 april 2019 at a public school.

	many dont consider .your program A virual product. it wasnt really..was it. " i couldnt talk to anyone." consider watching how well Progressive Insurance.TV Commercials " are perceived.. by their own omission. now that's Virtually correct "cannnn youuuu heaarrr me. yourrrrr c brekking up.. further more...My comments from the April 16 meeting ... have not been addressed in your 1000 page report. Which appears to have little or no change from last years. submissions I spoke to state road engineer for #2 two hours last april. yet none if my concerns are mentioned.. i commented before ... and was not notified of about the virual show How we're the public to know... ? Last year there were "approx" 280 comment? What is the average # number of a responese to a state road projects ? again how th PUBLIC to know... by rhe placement of electronic road sign on 857 ...really.. that " displayed the wrong DATE !! As i speak to others..i came to realize many of my neighbor's were unaware that a public meeting was held and comment petiod is closing. my explaination is that because the state ROAD didnt.. have public meeting! How many virtual meetings has the state had before this. ? What is the criteria . is used to rate the success of said virual meeting.? numbers are available for trational state road projects.. What is the total $. monetary (dollars amount total of the green bag road project ? .. Is this indeed the largest monetary amount ever considered virtually.... as i in a "Virtual public announcements" ? perhaps you over looked.. OR thIS WAS you attempted to lower the public comments by having the program the SAME evening as FIRST PRESIDENTIAL DEBATE...
542	Please reconsider this. You are going to take away an asset to this community (conscious harvest) that could grow and benefit the people of the city for years to come. Also many people do not want these roundabouts in their neighborhoods.
543	Don't be dumb ! Nobody likes roundabouts! A waste of a good stop light! Fix the original roads and leave the garden plots alone! Please don't take away another great project for our community!

544	The roundabout option - Option F - at Greenbag Rd intersection with Kingwood Pike would negatively impact the residences on Dorsey Ave. These impacts were not considered in the Environmental Assessment. What impacts are expected as the WVDOH asserted an increase in traffic noise, associated light, and air pollution on current residences on Dorsey Ave?
545	The proposed traffic circle on Greenbag Road would be a mistake for multiple reasons. The circle would take away the "Conscious Harvest" community garden, which be detrimental to the community. In such uncertain times of Covid, joblessness, and the poor economy, people need places like community gardens more than ever. The benefits of such gardens are: Increase access to fresh foods Increase physical activity through garden maintenance activities Improve dietary habits through education Increase fruit and vegetable intake Reduce risk of obesity and obesity-related diseases Improve mental health and promote relaxation Also, concerning traffic circles in general - the traffic circle on the Mileground was done poorly. The radius of the circle is too small, and the merge lanes are too short. West Virginia's landscape does not give adequate space to construct a well designed traffic circle. (Unless, you want to tear down half a neighborhood like they did in Fairmont to get the correct proportions for one.) The Greenbag Road area does not need a traffic circle where a 4 way stop and arrows would suffice.
546	I oppose the roundabout at Greenbag Road and Kingwood Pike for many reasons. The environmental justice report minimizes the impact to our including low income families who receive resources support from the community garden. This property is an outdoor research facility for the purpose of bringing increased food security to WV. Additionally, this property is a sanctuary for many pollinators including the at risk monarch butterfly. The family that owns this property has dedicated themselves to community building in Morgantown and setting an Incredible example of sustainable practices. The solution of land owner receiving financial compensation minimized the true value and loss of this property. Money can't replace everything. Money cannot replace family heritage, community or wildlife. This project site priorities legality while minimizing the non monetary costs and convenience at the price of sustainable community development.
547	We need to pull some truckers and as many as we can and block the intersection that will bring awareness to this awful idea
548	Waste of money !! Like there is a lot of traffic there. And not to mention having no regards to what the land owners have to say. Basically stealing their land. This county is so greedy. The truck traffic will still go through town no matter what, they won't be forced to go Greenbag road. If this was any county commissioners land, I guarantee this project would not be happening.
549	Terrible idea. Making it more difficult for those of us who live in the area to get where we need to go! Hate roundabouts!
550	Every time I go near the one in the Mileground someone comes close to hitting me. I refuse to go near it anymore. I absolutely hate roundabouts!
551	, taking working farm land for this particular roundabout disturbs me. I, also, worked for 2 years in the downtown area & drive through it frequently now, and it is never really crowded. I can always find a parking place, either on the street or in a city owned garage.
552	Unbelievably foolish. 2 roundabouts there will INCREASE truck traffic downtown. If the MPO & the Commission knew the first thing about trucking they would know they set their GPS to avoid them. LMAO Large trucks need to take up two lanes to make a circle making it that much more dangerous for cars to enter.

553	I don't see how they are going to work well with large trucks that have a wider turning radius. And considering how jacked up that wannabe roundabout on the mileground turned out. I'm not sure I trust this state to get it right
554	There are two sawmills on the Kingwood Pike. There are many gravel trucks in the area that are also top heavy (in fact all semis are) They roll over in roundabouts all the time. This will be our future thanks to the CC & MPO...(good thing no one was around in this case - we won't be so lucky) Let's not forget they don't treat the roads in winter here either and the excuse is "no money"...
555	What poor planning this is...I'm certain funds are needed more in other areas. Even the roundabout that went into the new I-79 West ridge location is short-sighted, given the amount of growth and traffic that area is projected to have. Bad enough they didn't put sidewalks in that area or a traffic light by one of the busier business intersections.
556	Spend millions more on another roundabout that people will avoid and just leave the rest of the roads to turn to rubble. That makes perfect sense. LOL
557	I can just see those Greer trucks navigating that on the way to their tipple on Don Knott's Blvd. Hahahaha
558	While stealing land that belongs to someone else? Uncool. I'm disappointed.
559	They should have done the West Run bypass they discussed centuries ago. Greenbag is a bad idea. We need a better airport more than another round about.
560	Why is this happening?
561	There are a lot of residents who oppose this. Why is this even on the table. The farm is a great community resource and should be honored as such.
562	Terrible
563	This is stupid what idiot comes up with this stuff
564	What a stupid frickin idea....so glad to be the hell out of Morganhole
565	Many residents opposed this. It is a resource for many. Why did they choose this area?
566	the land still doesn't belong to the county. How can you justify stealing someone else's land?
567	you're ignoring comments about this. This is not your land to take and these people's lives matter too!
568	This land belongs to a family. Many people have offered to buy it from them for millions but they felt it was more important to keep their family farm than to sell for money. I agree with progress but not at the expense of taking others land.
569	Greenbag Rd/ Rt7 intersection in Sabraton has finally been made to be truck friendly to use when turning onto Greenbag Rd. Now the higher ups in this county/state decide to add two roundabouts which will encourage the trucks not to use Greenbag Rd even more after they are built and continue to use Rt 7/Brockway Ave. through town which is in bad shape now. Leave Greenbag Rd as is!!!!!!!!!!!!!!!!!!!!!! and add a third lane lane past Giant Eagle to turn right down Don Knotts Blvd!!!!!!!!!!!!!!!!!!mthat will help alleviate a lot of the traffic back ups and make it more truck friendly. The folks who make these decisions evidently do not drive this road several times on a daily basis and haven't a clue what is best.
570	NONE of our commissioners live around Greenbag Rd. If I was ignorant of an area I would want to hear from the residents who live nearby. They don't care and are proving it. Also, our MPO is headed by out of state, progressive traffic engineers who are more concerned about adding bike lanes than fixing the years of neglect causing our roads to collapse. Our roads are like cow paths that aren't suitable for any auto let alone bikes! You are absolutely right about Sabraton. Truckers and residents fought two roundabouts proposed there and won. WHY are we not being

	listened to? GB Rd is a continuation of the truck route they are pushing for. What makes them think truckers will use this? The residents sure don't want it. There was even an editorial in the paper this week against the roundabouts.
571	Stealing land and making an already steep hill more dangerous in the winter, let alone any other time of the year. Progress? No way. Progress, would be listening to the folks who actually live on this road and use it daily.
572	The 2 we have in Mon Co are so inadequate.
573	Getting round a bout crazy around here, this is not DC. I don't see a huge problem there, seems to flow alright most of the time, I think a couple turning lanes would handle any problems.
574	This will be an engineering feat of epic proportions. I can't even imagine how this will be accomplished.
575	you don't realize that a round a bout at this intersection is not going to keep trucks from driving through downtown. It will more than likely increase that truck traffic through town. I have heard many truck drivers say they do whatever they can to avoid driving through round a bouts
576	[the trucks] They could already use Green Bag Rd or interstate. They drive through town just because they can and do it just for spite. There would be little difference in fuel to taking alternative routes. They are simply a bunch of assholes and don't give a damn how much they destroy the streets.
577	Most people that live on and drive the Kingwood Pike are opposed to this.
578	I'm almost completely positive no trucks will travel this route. They will still go through town like they always have that won't change. And the trucks that will take the "roundabout" we hog all the lanes and just cause wrecks
579	Nobody reads the fine print or looks beyond the part they like when they vote on this type of stuff
580	No one voted for two roundabouts. It was never on a project list and you know that.
581	Did you read the MPO report I linked about the projects you keep citing? I can back up everything I say. It clearly recommends turn lanes there. (It doesn't even need those except at peak hours- there are less than 6 cars there at other times) What kind of bait and switch is going on here?
582	What is with the roundabouts? Is somebody making money off these because all the sudden they are the answer to everything. I think turning lanes would solve the problem just fine and the cost would be minimal compared to a roundabout, it would also take less of people's property. I see more damage and ill feelings with a roundabout and no positives.
583	The entire Roads to Prosperity (not progress) bond sale was a huge bait and switch. The fact is, when these politicians see money, they will find a way to get it, even if the project makes zero sense whatsoever.
584	A roundabout makes NO sense at THAT intersection. (the other one either) The residents who will be forced to drive it every day know this and hold the opinions that matter. Van Voorhis Rd is getting a big project too and I am not butting in as I don't live there.
585	There is no need for a round about at the intersection. Traffic moves quite well with things the way they are now. A roundabout is far more dangerous. There needs to be some change to the law that forbids those trucks from going through town.
586	The intersection with lights is quite safe as is. The money can be better spent on other more needed. Unless the driver is some moron there is no risk in navigating the present arrangement.
587	I avoid the roundabout! I believe the signal lights has served the purposes for years! People needs to be more patient, while they are waiting for the light to change, they can observe their surroundings! The citizens needs to help the city, county and state in stop spending money foolishly! If it's working, leave it alone! Our taxes are extremely high the way it is now!

588	NO ROUNDABOUTS. This is BS. Sad this good family is going through this. The people who travel this road and will be detoured for who knows how long over the 2 year+ construction (DOH couldn't give an actual answer at meeting) are under stress too. ☹
589	Prayers to the Hastings family that they can keep their farm!
590	Maybe they should take the roundabout out to cheat lake in front of Chestnut Ridge church, just sayin! They have sheriff's dept directing traffic.
591	No round-a-bout is needed. If the state can forcibly take this property is yours next on their list of whims??? The Sabraton intersection change was not necessary. It cut off safe convenient access to Rt. 7 from Doug Hill Rd., Woodburn, Jerome Park and Norwood, and serves no purpose. Money spent padding many pockets for the project could have resurfaced several secondary roads.
592	Right no roundabout needed wasted money
593	Farm or not, why the roundabout craze, people don't know how they work and it worsens traffic.
594	Kingwood Pike intersection SHOULD NOT CHANGE! Traffic is only backed up slightly during a 1/2 hour span. Waste 10 millions dollars for that? How much money was spent up the road a little ways past the Hasting's farm on the concrete curbs on the left? Ever since that was done water lays there and is very treacherous in the winter.... spend money to fix that!!!!!!! This is so infuriating!!! This money should be used to improve road surfaces, not creating a roundabout. Speaking of treacherous, the detour for the proposed project will detour down Aaron's Creek, really??? Take some of the money and repair this road before someone gets killed!!!! Resurface and put up guardrails where they are needed!!! Leave the intersection alone!!!!!!!!!!!!!!!!!!!!!!!!!!
595	When I called the DOH to complain about the K. Pike drainage issue, they agreed the road was fine up until the "engineers" got involved and CAUSED a drainage issue with the curbs. Unbelievable. Can you IMAGINE the future disaster they could create if citizens are dumb enough to open the door to this project? Infuriating is right
596	instead of planning the drainage and considering the danger to the wetlands BEFORE u start building you wanna design and build? thats your method? are u kidding!!!!!!!!!!!!!!! thats so half-assed and stupid youre going to make things WORSE!
597	Stupid, intersection ran smooth before lights were installed, everyone took their turn. Use the funds to fix the existing roads what a smart man would do
598	! Residents are not in favor of a 2-5 year project that adds a round about at the Greenbag Rd/Kingwood Pike/Dorsey Ave intersection. As well as one by the turn in to South/White Park. This project if chosen would take away the farm at the bottom of the hill, closes the Pike, re-routes traffic on the Aaron's creek rd. (Which is dangerous and cannot handle the amount of traffic and buses/18 wheelers that travel the Pike daily. And would impact thousands of travelers daily. The money could better be used to fix the roads in the area! The Pike itself is pothole ridden, uneven/sinking lanes and needs repaved. Please help us and spread the word! *Residents are in favor of a turning lane*
599	Turn it back into a 4 way stop and take out the stupid lights
600	Traffic moved much better with the stop signs
601	[traffic moved better with the stop signs] I agree
602	We do not need a roundabout with all the log trucks and business owners that live on the Kingwood Pike that have to move large equipment such as Pork Hilling, Nolan Dalton, Jason Nicholson, Bulldog Logging, Derek Hart and more that actually have big equipment they bring up and down the pike daily! A roundabout will not be practical for these hard working people!

603	Back in the day. When it was a 4 way stop. You didnt have backed up traffic. Now it's a freakin light and roundabouts everywhere. 4 way stops. Go back. I think the one on 705 is a freakin joke. Traffic is still.sucks. even more.
604	NO! Not when it's taking someone personal land that THEY PAY FOR
605	why do they need to take a personal farm rather than an abandoned restaurant? Makes no sense
606	If you drive through that intersection, putting in a roundabout will have lasting issues. It's not a flat area like on the Mileground or UTC
607	Love all these ppl who don't realize you can't take a large trailer through a roundabout. You know like many of the small business owners use up and down the Pike. Hauling, wood and personal use trailers as well as campers and rvs don't do roundabouts well. Plus ppl get modular homes up the Pike bc Summers schools isn't able to handle them, the roundabout would make that impossible. Sorry but there are many many down sides to a roundabout, not even mentioning the stealing of personal property for it.
608	Maybe a turning lane but ABSOLUTELY NO ROUND-A-BOUTS!!!!!! FIX THE KINGWOOD PIKE ROAD!!!!!!!
609	In regards to the detour- I drive lower Aaron's and Cobun creek almost everyday to get to the Pike or Summers School from 119 for my job. Those roads not able to handle the capacity of numerous vechicles in both directions. The roads are NOT WIDE ENOUGH. Many times I have to pull over in a ditch or back up into someone's driveway to let others pass or vice versa. Both roads are in terrible shape from pot holes to poor drainage and will only get worse with the traffic. Cobun has no intentions of being fixed until the reservoir is finished. Oh and please consider an alternative to taking that farm at the light away from those hardworking, amazing people. What a terrible position to be in right now
610	It's currently one of the safest intersections in all of the county. Hardly any accidents. Why ruin it? It's only backed up at peak hours. Same as everyplace else in town
611	All they need to do is put turning arrows with the lights that are already their. Easy fix ! Why spend millions. Then they would have money to fix the roads
612	you would need a turning lane or only have one direction moving at a time to have an arrow. Still would need to widen the roadway
613	Just add an exit on/off ramp to 68 by the Kingwood Pike overpass and it would eliminate most of the 4 way traffic. Another exit is needed here.
614	Turning lane would be awesome!!! I still think they should put in a entry to the interstate
615	I wish they would worry about the roads that are already bad instead of making other roads that people don't understand how they function.
616	Fix the dang roads and put a turning lane in that's all that is needed
617	I hate roundabouts
618	[I hate roundabouts] me too
619	[I hate roundabouts] me too
620	Fix the roads first,quit patching,
621	No fix the roads before even thinking about adding
622	They need to put a turning arrow for the pike and pave the road
623	A round about is not necessary! I know the family who owns that farm and they have every right to kee their land as it is. A turning lane would be a better alternative. And if they're gonna destroy something they could just remove the old atomic grill since nothing is going in there. DO NOT TAKE THE FARM, IT IS NOT THE DOHs RIGHT TO TAKE LAND
624	around about is not needed

625	just fix the road we don't need a roundabout
626	You could use Cobun Creek Rd to Exit 1, Lower Aarons Creek to Greenbag, or Aaron's Creek to Summers School Rd. to Exit 4. A turning lane could be ok but would also most likely shutdown the intersection and take land as well, though possibly not as much. Could always take Atomic's land and the lot across from it
627	I live and drive on Aaron's creek. No way can it take any large trucks. They wouldn't make it up the hill and over the hump at top. They would bottom out. Has happened many times. The road is not suitable for any large traffic. It is not a two lane road and the pull overs aren't big enough for large vehicles. The lights at the intersection with a turning lane should work just fine
628	can you imagine all the traffic trying to come up from Aaron's Creek onto the Pike. That would be deadly
629	Potentially a stop sign instead of a light could work, or even better, time the lights so one direction goes green but the opposite waits 10 to 15 seconds before they go green. The original direction goes red and the opposite direction stays green for another 10 to 15 seconds. Then do the same with the cross streets.
630	The farmland that would be taken as part of this project is a community treasure. The Hastings have opened their land for use by the community, many of whom would not have access to land to grow gardens and farm if not for the generosity of this family. Please reconsider either the positioning of the roundabout or the project altogether. Many families and individuals rely on this property remaining intact
631	I fully support the roundabout as it has the best solution to improve traffic flow.
632	Two traffic studies of the corridor have determined that the flow of traffic through the Greenbag Road (CR 857) corridor is controlled by the level of service (LOS) at the major intersections. The current traffic conditions and operation are considered acceptable. Potential growth in the region could negatively impact the flow of traffic. HDR Engineering, a WVDOH Contractor, has stated roundabouts with high traffic volumes become difficult. Currently, West Virginia Division of Highways (DOH) is eliminating the roundabout at the University Town Centre exit, Exit 153, that was built for $22,000,000, and less than 2 years later is being replacing with a divergent diamond interchange (DDI) for $7,000,000. The existing roundabout setup could not handle the traffic generated by the amount of development taking place. Has this recent and relevant lesson-learned been considered by WVDOH? Will the WVDOH consider the DDI design now, so can prevent a potential redesign in the near future due to potential growth and traffic increases? Roundabouts bog down when so much traffic is trying to enter the circle that cars begin to queue in the access points, often resulting in the placement of traffic lights, which defeats the original purpose.
633	Building a roundabout on Greenbag Road is not an improvement for the community. It is not only unnecessary and burdensome (no one likes roundabouts honestly), but will also be harmful towards the community. Please consider the negative impact that this will have on the Conscious Harvest program, and the countless individuals who thrive as a result of this wonderful resource, on multiple levels.

634	We need a safer way to walk and bicycle alongside Greenbag road, especially between Aaron's Creek Road / Morgantown Printing and Binding and Mountainview Elementary / Luckey Lane! The shoulders and margins of Greenbag Road receive regular daily foot traffic, including children. Not everyone has access to a car. Thank you for considering our community feedback.
635	This shall serve as a response to the proposed Greenbag Road Improvement Project located in Morgantown, Monongalia County, WV 26506.The West Virginia Department of Highways is currently proposing improvements to Greenbag Road in Morgantown, Monongalia County, West Virginia 26506. The 1.28-mile long project's roadway improvements include wider lanes and shoulders, turning lanes, drainage enhancements, and improved intersections of two roundabouts. Because this project anticipates the use of both federal and state funding, it falls under the purview of the National Historic Preservation Act (NHPA). Per the Section 106 review process,the Morgantown Historic Landmarks Commission is formally requesting an extension for the commenting period on the Greenbag Road. There is concern that both the architectural and archaeological reports completed in anticipation of the proposed project are flawed and lack the proper level of detail to adequately document the significance of the resources in the vicinity of the project area. We request time be given to conduct Shovel Pit Tests(STP) to look for any archaeological findings that could contribute to the recording and preservation of the land. An extension on the project would allow for the addition of these findings as well as an opportunity to update the HPI form on file. We look forward to consulting with your office on this project. If you have any questions, or require additional information, please feel free to contact me at 304-685-7747 or by email at shannontinnell@earthlink.net
636	Obviously these intersections need to be upgraded, so thank you for addressing them. While local drivers hate traffic circles/roundabouts, I'll leave that decision to your traffic engineers. I see roundabouts more and more in other states. People will get used to them. At least the circles proposed for Greenbag Rd. might be less susceptible to the backups seen at the 705/Mileground traffic circle. I am very happy that you acknowledge the fact that people actually walk! I absolutely support the sidewalks proposed, and think MORE sidewalks are needed: they should be on BOTH sides of the road because crossing Greenbag Road on foot is extremely difficult (constant vehicle traffic at high speeds), and many people do walk. I love that someone will be able to walk from Dorsey to Giant Eagle and Mountaineer Mall (as well as all of the other businesses along Greenbag) without walking on the (nonexistent) shoulder of Greenbag Rd. What you build now will be here for decades, so please address all aspects of transportation (car, foot, bicycle) and future growth now. Not everyone drives cars. Plus, getting people out of their cars would ease the burden on our roads. I would also like to see a bicycle lane along *all* of the new roadways. People do ride bicycles as well as walk, and Geenbag Road and Dorsey Ave are extremely dangerous for cyclists (and pedestrians). Luckey Lane is a great way to avoid the Kingwood/Dorsey intersection with Greenbag, but that road is a total mess .... very narrow, deep potholes, steep drop off on the edges, and deep ditches (I saw a pick-up truck stuck in a drainage ditch below Family Dollar). I am glad you will be addressing it. I hope you make Luckey Lane is wide enough for cars AND bicycles, as well as pedestrians. The school being located there makes it even more complicated. Big school buses sometimes use that road, and I have seen big trucks use it as well. They take up the whole width.

	Finally, I ask that you please preserve some or all of the farmland at the Kingwood Pike/Greenbag intersection. The EA said no businesses would be affected, but that farm is an active, registered business. The corner lot where Atomic Grill used to be located before they went out of business has not been active for a very long time and has been storing heavy equipment (presumably DOH's equipment?) for a long time. The house that has a small business (Premier Tax Services) is set way back off the intersection. Could you not shift the roundabout to save that farm or at least part of the farm? The current plan appears to take all of the farm while saving the crappy former Atomic Grill property and the empty lot next to the residence that also houses Premier Tax Services. Perhaps you could find a somewhat happy medium?
637	Revision of my previous comment: Due to the high numbers of comments submitted last year asking for turning lane options, and the consideration that was granted by WVDOH for these options but not the analysis, we formally and humbly request analysis of turning lane options (further described below) that were alternatives requested last year, 2019 and demanded this year, 2020. A collection of public comments submitted April 2019 suggesting interaction turning options at Dorsey Ave/Kingwood Pike can be described as two 11-foot travel lanes on Dorsey Ave and Kingwood Pike, curb and gutter, and sidewalk, as proposed in all designs. And Option D intersection designed pertaining to Greenbag Rd approaches. This can be summarized as “Option G." Proposed Revision: Please Consider "Option G" 1.) Design features relative to Greenbag Rd Approaches (Present in Option D) "Eastbound/westbound protected left turn phase” "Eastbound/westbound permissive turn phase with corresponding through traffic" These features relative to the eastbound/westbound turning phases do not displace any residences or businesses, while improving the LOS to C and E relative to the 2048 predictions, and increases the safety and access for motorized and non-motorized connections to meet the needs statement. 2.) Design features relative to Dorsey Ave and Kingwood Pike as proposed and described in Page 6 of PDF or Page iv. These features do not change between Alternatives or Options. "Dorsey Avenue (CR 81) will incorporate two 11-foot travel lanes with curb and gutter on both sides and a 5-foot concrete sidewalk.” "Kingwood Pike (CR 81) will incorporate two 11-foot travel lanes with 2-foot shoulders on both sides.” These design features relative to Northbound/Southbound approaches alone do not displace any residences or businesses, while improving the safety and access for motorized and non-motorized connections, and limiting impact to natural resources, Farmland soils of Statewide Importance, and Community Garden.

	Please consider "Option G." It creates the least amount of impact on existing businesses and residences on Dorsey Ave and the Kingwood Pike, while meeting project needs for LOS improvement, improving access for motorized and non-motorized connections,and decreasing impact on natural resources, and has the lowest estimated construction cost. Benefits of "Option G" can be summarized as: - not displacing any residences or businesses or non-profits. - preserving prime farmland with significant cultural and natural resource importance, including the home of Conscious Harvest Cooperative Community Garden, 501(c)3 Non-Profit; Joy And Hemp Universal LLC, WVDA Permitted Hemp Farm; the 118 year running hertiage family farrm - Hastings Family Farm (WV Tax Credit #); and Mockingbird Hill Farms agricultural production plots. - Valuing geographic topography of region and lessons-learned experience for previous road projects. - Reducing the amount of impervious surface, causing fewer impacts to nearby streams and wetlands. - Lowest estimated construction costs. This alternative in suggestion by the public should be considered during this point in the NEPA process to better inform the design and decision making processes from hereforward. An overwhelming number of public comments requested turning lane options at Kingwood Pike/Greenbag Rd intersection. The public sited numerous reasons why this should be analyzed further including line-of-sight, direct and easy-to-understand traffic flow, trucking vs. commuter safety, considerable grade incline approaching Greenbag Rd from Kingwood Pike, trucking load shifts, geographical slip topography, and lessening impacts to valued community assets (natural resources, businesses, and residences).
638	As a resident of Kingwood Pike, I see no reason for this project and the major disruption it would cause during construction and afterwards. It would require additional investment in other upgrades at diminishing value.
639	Safe crossing route over GreenBag road is essential. Thank you so much for continuing to build to inspire an active community.
640	Please include a HAWK pedestrian crossing in your plans for Greenbag Road in Morgantown to allow pedestrians to cross safely between White Park and the Sky Rock connector trail, per the recommendation of the Mon Valley Green Space Coalition. Thank you.
641	Please build a connector from dorseys to the rail trail to white. This is a great loop! South middle xc runs part of it but the greenbag crossing is too dangerous.
642	I would like to comment on the Green Bag Road project. I am not a proponent of traffic circles because of the one on the Mile Ground. The traffic circle is not pedestrian or bike friendly. No provisions were made for either and I would not ride my bike through there if I had to. What provisions are you making for pedestrians and cyclists? This round about is going to be in a community that students ride and walk to school. If it is as busy as the Mile Ground, something must be done to ensure the safety of the children and adults that walk or bike in that area. Speed limit 25 miles per hour, bicycles may use full lane signs, greater than 5ft. shoulders. Please make this safer than the roundabout on the Mile Ground that has no provisions at all for pedestrians or cyclists.
643	Please install a HAWK crosswalk across Don Knots blvd to allow trail users to access white park from the Rail trail access.

644	travel this road daily not nearly enough traffic to warrant a project this big. know the landowner too, how dare u take their land especially for such a joke of a project. give them what they want: a turning lane. dont need to take no houses to do that. ridiculous
645	I am in favor of the roundabout. anything to help traffic move across green bag road for the trucks and to get them off and away from downtown. I try to meet my son downtown every Friday morning for breakfast and 50% of our conversations are cut off due to the truck traffic
646	do not do this. the traffic isnt even bad there!!!!!! everyone hates this idea. dont make things worse there. if the ppl want a turn lane give them one dont take a huge chunk cuz ur greedy af
647	yall better not be taking that the Hastings are very nice people and do not deserve this. Do something in Suncrest, shit is wack there.
648	I live across town but travel here frequently. A roundabout is NOT needed. HUGE turning lanes are not needed. And whats this I hear about no plans to reroute the waterways? Deckers Creek? I work with Doctors without Borders to fix water issues and it sounds like you guys are ready to create one. Use the road you have, widen it slightly, and add a turn arrow.
649	This is a historical site.. that farm is ancient i dont care if they grow grass its not YOURS to take. what a stupid project, it would be different if the options were good but all u gave us was crap. the public deserves better we want better options!!!!!!!!!!!! or no option, no one cares if it stays the same i know all the pikers want it to stay the same. if it aint broke dont fix it HELLO
650	no roundabout. let the public vote. 4 way stop or turning lanes. stop ruining our state stahl shaffer enginerring and stupid county comission u guys dont speak for the people not even close leave us alone
651	i work with land preservation in state parks and i cant believe what is happening here. you guys want to destroy 2 acres of prime farmland soil? that should be illegal!!!! mother nature wanted me to tell you..... get a life! do some soul searching. u need serious help if you think this is okay.
652	LEAVE OUR ROAD ALONE WE LIKE IT LIKE THIS
653	Please add crosswalks on greenbag road to assist trail users in White Park to access Dorsey's Knob trail system. One location is the Mississippi St and Greenbag Road intersection. This will be a safe means to connect the parks allowing residents to enjoy the south Morgantown area more easily.
654	Green bag road needs a pedestrian crossing.
655	I would like to advocate that as part of the proposed trail loops linking White Park and Dorsey Knob that a safe, on-demand, pedestrian crossing for Greenbag Road be included as part of the road improvements.
656	Residents are not in favor of a 2-5 year project that adds a round about at the Greenbag Rd/Kingwood Pike/Dorsey Ave intersection. As well as one by the turn in to South/White Park. This project if chosen would take away the farm at the bottom of the hill, closes the Pike, re-routes traffic on the Aaron's creek rd. (Which is dangerous and cannot handle the amount of traffic and buses/18 wheelers that travel the Pike daily. And would impact thousands of travelers daily. The money could better be used to fix the roads in the area! The Pike itself is pothole ridden, uneven/sinking lanes and needs repaved. residents are in favor of a turning lane
657	I don't see how a roundabout works with the terrain at that intersection.
658	A round about is not necessary! I know the family who owns that farm and they have every right to kee their land as it is. A turning lane would be a better alternative. And if they're gonna destroy something they could just remove the old atomic grill since nothing is going in there. DO NOT TAKE THE FARM, IT IS NOT THE DOHs RIGHT TO TAKE LAND
659	How many roads could be paved and other projects completed with that money?

660	I wish the roads would just get paved again. The patch jobs they do is horrid. Down town and going over to the mall through Westover is the worst. It's patch after patch after patch. Our roads have been so neglected it's really sad.
661	downtown roads are supposed to be maintained by the money that is taken from the checks of people that work inside city limits, where is that money?
662	To the Department of Transportation, the Department of Highways, and Concerned Parties, I am writing on behalf of Conscious Harvest Cooperative, as I am on the Board of Governors. concerning: FEDERAL PROJECT # STP-0857(019)D / STATE PROJECT # U331-857-0.67 / (GREENBAG ROAD IMPROVEMENT PROJECT) Let this letter serve as Notice: Details in the Environmental Assessment (EA) about our nonprofit business, Conscious Harvest Cooperative, are not adequate and require redress. The EA states,"Impacts to the community garden have been minimized to the extent practicable." This may misrepresent the scope of the project. The area used by Conscious Harvest Cooperative is almost completely within the limits of disturbance. The value of this community, cultural, and agricultural resource would be destroyed if the project moves forward as currently designed. The design and build portions of the project around the waterways and tree-line are concerning will effect our business and may be significant. We have grievance with the fact that our entire 501(c)(3) nonprofit designation will be at risk if the proposed roundabout (Option F) is chosen. Conscious Harvest Cooperative formally request an Environmental Impact Statement (EIS) be fully prepared to the best of the State and Federal Governments' ability to address the inadequacies and omissions in the EA. The land Conscious Harvest Cooperative is located on has a soil type of Statewide Importance for Prime Farmland. It is listed within the USDA registry as Prime soil type and is of protected designations. Conscious Harvest Cooperative formally requests a Land Evaluation and Site Assessment (LESA) as protected by Federal Law. This process of LESA was not afforded to our business, this is a violation of the National Environmental Protection Act (NEPA). Let this letter serve as notice that our organization intends for remedy. Conscious Harvest Cooperative formally requests an Environmental Impact Statement (EIS) be fully prepared to the best of the State and Federal Governments' ability to to acknowledge that our business is adequately represented and the impacts to the soil, community, and business are correctly assessed, as required by State and Federal Law. The funding for our Farm to Families Program, in part, comes from renting community garden spaces, as well as, fundraised and donated monies. This cornerstone program is an income based subsidized Community Supported Agriculture (CSA) program that connects individuals and families with fresh local produce. Partner organizations join our Cooperative to access healthy food vouchers. This CSA program connects local farm and community agencies. Shareholders are then provided with CSA shares at a subsidized price. The community garden is the backbone of our outreach programs. By renting community garden spaces, we generate significant income to fund such projects. The loss of these community garden spaces would severely damage our nonprofit. In 2020 the Cooperative invested an estimated $9,555 back into the local food economy, purchased an estimated $6480 of produce for families, and provided an estimated 2000lbs. of produce to West Virginia families, these figures are annual and exponentially growing. Loss and/or damages to this program and other similar programs is significant and will require remedy and/or mitigation. The Farm to Families Program provides qualifying families access to fresh local produce. We directly procure from local farms such as Mountain Harvest Farm. The food is delivered to locations such as The Shack Neighborhood House in Osage, WV. The food is distributed to qualifying families. Without our cost-share program, these families may not otherwise have access to fresh, local produce. This is a significant

	impact to these families involved, as well as a significant impact to Mountain Harvest Farm, and our nonprofit business. It may be determined that remedy is necessary for all concerned parties and/or mitigation. Thank you
663	Now that I know it's a medicine farm, Ima try to check in and comment against another stupid circle.
664	I don't like Morgantowns new obsession with roundabouts people can't figure them out sober much less hammered. Also can one imagine coming off the pike after a snow storm and having to dukes of hazzard the median of that circle cause we can't keep the roads clear?
665	They screwed that up when they put the light in. When it was stop signs everyone took turns and never backed up like now!
666	That shows how intelligent the DOH is. Now people want the Greer trucks to run out Greenbag, you imagine the mess a roundabout would cause? They pushed for one at the other end, which all it needed was the turning lane that was finally put in.
667	They don't need a round about, all they need is a turn lane and to fix the pike.
668	No more roundabouts!! Drivers in Morgantown already dont know how to use them. We don't need more roundabouts for people to not know how to navigate. ☺☺ There are ways around this intersection for people who want to avoid traffic that don't include ruining someones farmland.
669	I can sacrifice 10 minutes of my time to save someone's land. It's only congested twice a day and on game days. I'm not sure that justifies taking someone's land. I understand eminent domain in some circumstances (like getting water to people) but this seems really unnecessary
670	How about a turning lane with a left turn signal. Should work
671	how about the 4 way stop sign again.
672	My business TONG THAI FRESH, LLC is leasing the land so that we may grow "trademark" ingredients for our signature products sold at our business. Some ingredients that we grow are: lemongrass, galanga, thai chilis, garlic, onions, and tomatoes kefir lime, string beans, etc. These ingredients are key if we are to have a niche, generate revenue and survive. Also these are ingredients my family and I are consuming in our daily lives. Growing our ingredients on the Hastings Land also saves us money on Food Cost for our business as well. Our ingredients grown on the Hastings land are also better tasting and higher quality than those found in the store or with Cisco and other food delivery service providers. These higher quality ingredients are the key to TONG THAI FRESH, LLC market functionality. These ingredients will give us an advantage in the market. My business and I are leasing a portion of that land located on the Greenbag Road four way where the roundabout may be placed. That land will generate revenue for my business. I went to the County Commission meeting at the courthouse during the open comment session and told Tom Bloom and the rest of the Commission about some of the impacts of the proposed plans that would eliminate the land I am leasing and using as a resource. Also the Greenbag Road Improvement Project will definitely affect my life, liberty, freedom, and my pursuit of happiness. Once again this "Greenbag Improvement Project" will have an enormously negative impact on my life my family's life and the life of my business and potential employees of my business. Also the Greenbag Road Improvement Project will have an impact on minorities since I will be hiring minorities.
673	this will effects my plans to sell produce, and this will effect my business because it will take most of the area i do sell produce on it, plus it take more time to finish will close my way i use daily to my house, and west a bigger piece of value farm land ,west more money that city need it in different things, most people they don't know how to use it they get confused in it ,the third line add it to the existing traffic light much easer

	to use less land to west cheaper on price ,less time to finish and every one know how to use it ,plus i am originally from the third word country my country took all round about out of service and put in the traffic light make traffic way easer to use , i do not know why city of Morgantown trying to get us back to the stone ages ,we should plan for this city for many hundred years from now not only for the moments we live ,hopping there is some one has more wisdom for future plans .
674	My comments are framed within the opportunities identified in the MMMPO's 2015 Greenbag Road Study, stating that there are nine different neighborhoods and/or community facilities within a 0.5 mile buffer of the western section of Greenbag Rd. I feel recent major road projects have not taken the opportunity to play a key role in connectivity and inclusivity of community populations to move around and enjoy local amenities on any form of transportation they may have available to them. And while this proposed plan does incorporate some improvements for these populations, it does not extend improvements to account for community connections on the east side. Please let this project be an example to the way the greater Morgantown area would like to grow its communities for the future. A future that's inclusive, multimodal, prioritize public health and belonging. I would like to see increased sidewalk lengths, wider shoulder allowances for cyclists and pedestrians at a minimum (and preferably a separate shared-use path for these users) , shared lane markings according to the MUTCD along the entire project, a maximum speed limit of 25 MPH to reduce cycling and commercial truck conflicts.
675	Additional Comment: After reviewing the EA, the report's documentation for mitigation and total impacts to the water resources are lacking. It also does not follow the 'normal' chapters that a standard stream and wetland delineation follow. This and other inconsistencies indicate other government agencies may not have been given adequate information during the NEPA analysis. Please explain. Due to these concerns and others, landowners are moving forward with an independent Stream and Wetlands Delineation Report to be submitted to the Government on or before December 2020.
676	Conscious Harvest Cooperative's garden and community programs will be destroyed by the proposed road project's design. One of Conscious Harvest's primary goals is to build our community through partnerships, workshops, and social gathering. We recognize that without community, social justice is an out of reach goal. In 2017, Conscious Harvest began to act on this mission by partnering with wonderful people doing incredible work in the Morgantown area. Milan Puskar Health Right joined our organization last spring. Below is their story. "Participants at the Friendship House, a peer support drop-in center, have wanted to garden since Milan Puskar Health Right re-started the program in 2016. Fortunately, we partnered with Conscious Harvest in 2017 and were able to tend a plot. Getting outside and growing fresh produce benefited everyone at the Friendship House. Participants at the Friendship House are adults in recovery from substance use disorder and/or with co-occurring mental health diagnosis. Peer support is a way of providing help based on "lived experience." That is, our staff of Peer Support Specialists has personally experienced substance abuse disorders and mental health concerns. They use their experiences to work with people through the struggles and success of living in recovery. Our plot with Conscious Harvest provided a place for over 30 participants to be productive citizens and learn new, valuable skills. We were able to start seeds at the Friendship House and prepare the plot, transplant seedlings, harvest vegetables, and have picnics at the garden. We harvested tomatoes, onions, potatoes, lettuce, radishes, peas, and even a few gourds that all went to feeding low-income individuals in our community. Next year we look forward to expanding our efforts and collaboration!"

	You can learn more about Health Right and the Friendship House at mphealthright.org https://www.consciousharvest.org/latest-news
677	This is my second comment. The property at the corner of the Kingwood Pike and Greenbag Road that I own has a market value of millions of dollars.
678	Details in the Environmental Assessment (EA) about our nonprofit business, Conscious Harvest Cooperative, are not adequate and require redress. The EA states,"Impacts to the community garden have been minimized to the extent practicable." This may misrepresent the scope of the project. The area used by Conscious Harvest Cooperative is almost completely within the limits of disturbance. The value of this community, cultural, and agricultural resource would be destroyed if the project moves forward as currently designed. The design and build portions of the project around the waterways and tree-line are concerning will effect our business and may be significant. We have grievance with the fact that our entire 501(c)(3) nonprofit designation will be at risk if the proposed roundabout (Option F) is chosen. Conscious Harvest Cooperative formally request an Environmental Impact Statement (EIS) be fully prepared to the best of the State and Federal Governments' ability to address the inadequacies and omissions in the EA. The land Conscious Harvest Cooperative is located on has a soil type of Statewide Importance for Prime Farmland. It is listed within the USDA registry as Prime soil type and is of protected designations. Conscious Harvest Cooperative formally requests a Land Evaluation and Site Assessment (LESA) as protected by Federal Law. This process of LESA was not afforded to our business, this is a violation of the National Environmental Protection Act (NEPA). Let this letter serve as notice that our organization intends for remedy. Conscious Harvest Cooperative formally requests an Environmental Impact Statement (EIS) be fully prepared to the best of the State and Federal Governments' ability to to acknowledge that our business is adequately represented and the impacts to the soil, community, and business are correctly assessed, as required by State and Federal Law. The funding for our Farm to Families Program, in part, comes from renting community garden spaces, as well as, fundraised and donated monies. This cornerstone program is an income based subsidized Community Supported Agriculture (CSA) program that connects individuals and families with fresh local produce. Partner organizations join our Cooperative to access healthy food vouchers. This CSA program connects local farm and community agencies. Shareholders are then provided with CSA shares at a subsidized price. The community garden is the backbone of our outreach programs. By renting community garden spaces, we generate significant income to fund such projects. The loss of these community garden spaces would severely damage our nonprofit. In 2020 the Cooperative invested an estimated $9,555 back into the local food economy, purchased an estimated $6480 of produce for families, and provided an estimated 2000lbs. of produce to West Virginia families, these figures are annual and exponentially growing. Loss and/or damages to this program and other similar programs is significant and will require remedy and/or mitigation. The Farm to Families Program provides qualifying families access to fresh local produce. We directly procure from local farms such as

	Mountain Harvest Farm. The food is delivered to locations such as The Shack Neighborhood House in Osage, WV. The food is distributed to qualifying families. Without our cost-share program, these families may not otherwise have access to fresh, local produce. This is a significant impact to these families involved, as well as a significant impact to Mountain Harvest Farm, and our nonprofit business. It may be determined that remedy is necessary for all concerned parties and/or mitigation. (Continued)
679	We need safe sidewalks/pathways from Dorsey East to the end of the project. It would also be nice to incorporate bike lanes in both directions. If Morgantown wants to continue and/or enhance its status as a bike-friendly city, we should be able to bike safely into and out of the city for a reasonable distance.
680	Continued from #678 Nonprofits would be affected as well, such as the Friendship House. The Friendship House rents a garden plot for their program that allows for a space for recovering addicts to go into nature with members of a treatment group to find relief. This program was featured on ABC News Pittsburgh. The loss of these types of programs would be significant to the recovery community, the Friendship House, and Conscious Harvest Cooperative and would need to be redressed and/or mitigated. Local businesses would be affected such as Mountain State Brewing Co., this business relies on our organization to dispose of wood ash from their wood fired ovens. This ash is not accepted as municipal waste and is not allowed to be dumped at their location by the river as noted by the Monongalia County Health Department. Our organization saves this business time and money by remediating this waste into a usable agricultural amendment product. Loss to businesses like Mountain State Brewing Co. and Conscious Harvest Cooperative would be significant and remedy required and/or mitigated. Fundraising is a large part of our nonprofit business. Though the garden itself is within a portion of the land for our farming and gardening activities, the land as a whole serves as an area for fundraising. Access to this land for music venues, cookouts, and other events is significant and loss of such land access would impact Conscious Harvest and damages may need to be awarded for such disturbances to our business. Conscious Harvest has significantly improved the land in whole, and has used donated monies and earned monies for the gravel in the parking lot. Volunteer labor has maintained the driveway entrance and road access. These donated and earned monies and donated labor will need to be assessed, reimbursed, and remedied while considering the donated labor of the trucking company who delivered the gravel including: fuel usage, wear and tear of equipment, and time to spread the gravel and/or mitigation. Perennial plants bought from monies donated and earned as part of a beautification project are significant and would need to be reimbursed and/or mitigated. These plants include, but are not limited to: beautiful, hearty fig trees that require years of growth before fruiting. The fence around the garden was built with donated and earned money and will lose integrity if moved. This fence would require a substantial amount of labor and possibly large equipment/trucks to move properly. The labor and equipment rental must be remedied and our business reimbursed for damages incurred and/or mitigation.

	Moving the fence will require storage for an amount of time to be designated as we look for another location. Storage fees for the fence will need to be established and the finances reimbursed and/or mitigated to the maximum extent of the law. Reconstruction of the fence will be labor intensive and also may require large trucks/equipment and new materials. This should be considered in regards to financial remedy and reimbursement and/or mitigation. The pole barn located along the tree-line was built with a substantial amount of donated and earned monies and volunteer labor. Loss to this structure will be devastating as it will not be able to be moved. This structure is important to our business because it allows for shelter of our clients during inclement weather and also serves purpose during fundraising events. Mitigation and/or reimbursement of monies and labor must be remedied. Reconstruction of the pole barn will be labor intensive and also may require large trucks/equipment and new materials. This should be considered in regards to financial remedy and reimbursement and/or mitigation. (Continued)
681	Continued from #680 The tool shed along the tree-line contains donated and purchased tools. Loss of the shed will be significant. The tool shed was built with volunteer time as well as with donated and earned monies for materials. There is an appreciable mural painted on the shed by volunteers and local artists with paint procured by our nonprofit, damages will be significant and mitigation and/or reimbursement will be necessary. Reconstruction of the tool shed will be labor intensive and also may require large trucks/equipment and new materials. This should be considered in regards to financial remedy and reimbursement and/or mitigation. A temporary storage space, in place of the tool shed, for all the tools will be needed. Tools will require storage for an amount of time to be designated as we look for another location. Storage fees for the tools and maintenance of the tools in storage will need to be established and the finances reimbursed and/or mitigated to the maximum extent of the law. The tilling and maintaining of the individual garden beds is significant. Some members have worked their individual plots for years, even before the 501(c)(3) destination was awarded. The fact that they can continually garden in the same location is important to the integrity of the crop, the soil, and our project. Mitigation and/or reimbursement may be necessary as remedy for the hours of labor and materials put into these garden beds. Creation of new garden beds will be labor intensive and also will require large trucks/equipment and new materials. This should be considered in regards to financial remedy and reimbursement and/or mitigation.

	The ability for our clients to have access to soil of this type, to grow food varieties of their choice, with whatever techniques they choose is significant. The service we provide gives our clients access to local food and creates sustainable food security. This is very important, especially during a pandemic, COVID regulations, restricted store hours, and limited food product availability. The loss to each individual member of our garden may be significant and require remedy to their persons and/or mitigation. Reacquiring land of this soil type, with access to parking, room for a pole ban and tool shed, with consideration to proximity of a metropolitan area, would be burdensome and challenging. The damages to our nonprofit would be significant if this project continues as planned. Access to this land may be irreplaceable. Mitigation and/or remedy may be necessary. Let it be known that standing EA has not allowed for adequate time to assess the full impact to Conscious Harvest Cooperative 501(c)(3). The standing EA appears to have inadequacies and omissions pertaining to the soil type at our location. Exact amounts and values for remedy are to be determined, the burden is ongoing. The design and build phase is concerning; and, additional damages incurred to our business may be assessed and reassessed in the future as we continue to identify more damages, as the damages are ongoing.
682	Dear R.J. Sites and all Interested Parties concerning: FEDERAL PROJECT # STP-0857(019)D / STATE PROJECT # U331-857-0.67 / (GREENBAG ROAD IMPROVEMENT PROJECT) I am a concerned party regarding land (Map 48, Parcel 10 & 11, and Map 10, Parcel 54.10) as I am an owner. The proposed project would effect my person. My land is within the boundaries of disturbance for Option F as described by the Environmental Assessment (EA). I reserves the right to seek damages and/or remedy if this project continues as planned with Option F listen as the “preferred” alternative.
683	Dear R.J. Sites and all Interested Parties concerning: FEDERAL PROJECT # STP-0857(019)D / STATE PROJECT # U331-857-0.67 / (GREENBAG ROAD IMPROVEMENT PROJECT) I am a Concerned Party regarding this project, as I anticipate inheriting the land in question (Map 48, Parcel 10 & 11, and Map 10, Parcel 54.10) from my father Dewey Hastings This project would affect my person as the land in question is within the boundaries of disturbance of Option F. I reserve the right to damages and remedy if this project continues as planned with Option F listed as “preferred” alternative.
684	Dear R.J. Sites and all Interested Parties concerning: FEDERAL PROJECT # STP-0857(019)D / STATE PROJECT # U331-857-0.67 / (GREENBAG ROAD IMPROVEMENT PROJECT)

	I am a Concerned Party regarding this project, as I anticipate inheriting the land in question (Map 48, Parcel 10 & 11, and Map 10, Parcel 54.10) from my father Dewey Hastings This Project would effect my person as the land in question is within the boundaries of disturbance for Option F as described by the Environmental Assessment (EA). Notice: The proposed project has NOT afforded Dewey Hastings participation in the 106 Review process and maybe in violation of Federal Law under the National Environmental Protection Act (NEPA). Dewey Hastings does in fact do own land in a location of contribution to a qualifying historic site "The Dorsey Plantation" more commonly known as "The Dorsey Farm". Notice: The proposed project has NOT afforded Dewey Hastings to participation in the 106 Review Process and maybe in violation of Federal Law under the National Environmental Protection Act (NEPA). Dewey hastings does in fact own land in a location that is significant to material culture of history and pre-history. Notice: The proposed project has NOT afforded Dewey Hastings participation in Land Evaluation and Site Assessment (LESA) and maybe in violation of Federal Law under the National Environmental Protection Act. Dewey Hastings does in fact do business in a location of "Prime Farmland" and has soil of "Statewide Significance" Notice: I, Ted Hastings, heir to Dewey Hastings, reserve the right to seek damages and/or remedy if this project continues while denying Dewey Hastings rights as afforded by NEPA.
685	Dear R.J. Sites and all Interested Parties concerning: FEDERAL PROJECT # STP-0857(019)D / STATE PROJECT # U331-857-0.67 / (GREENBAG ROAD IMPROVEMENT PROJECT) I am a concerned party regarding land (Map 48, Parcel 10 & 11, and Map 10, Parcel 54.10), as I am an owner. This Project would effect my person as a portion of the land in question is within the boundaries of disturbance for Option F, as described by the Environmental Assessment (EA). Notice: The proposed project has NOT afforded my person participation in a 106 Review and maybe in violation of Federal Law under the National Environmental Protection Act (NEPA). I in fact do own land in a location of contribution to a qualifying historic site "The Dorsey Plantation" more commonly known as "The Dorsey Farm".

	Notice: The proposed project has NOT afforded my person to participation in 106 Review and maybe in violation of Federal Law under the National Environmental Protection Act (NEPA). I in fact do own land that is significant to material culture of history and pre-history. Notice: The proposed project has NOT afforded my person participation in Land Evaluation and Site Assessment (LESA) and maybe in violation of Federal Law under the National Environmental Protection Act. I do in fact own land in a location designated “Prime Farmland” with soil of “Statewide Significance” Notice: I reserve the right to seek damages and/or remedy if this project continues while denying me rights as described by NEPA.
686	Dear R.J. Sites and all Interested Parties concerning: FEDERAL PROJECT # STP-0857(019)D / STATE PROJECT # U331-857-0.67 / (GREENBAG ROAD IMPROVEMENT PROJECT) I am a concerned party regarding Joy and Hemp Universal, LLC as I am an owner. This Project would effect my business. Joy and Hemp Universal, LLC is within the boundaries of disturbance for Option F as described by the Environmental Assessment (EA). Notice: The proposed project has NOT afforded my business participation in the 106 Review Process and maybe in violation of Federal Law under the National Environmental Protection Act (NEPA). Joy and Hemp Universal LLC does in fact do business in a location of contribution to a qualifying historic site “The Dorsey Plantation” more commonly known as “The Dorsey Farm”. 688	We do not need nor want this roundabout! It's just plain crazy to put a roundabout at the end of the pike with all the log trucks, dump trucks and more large vehicles that have travel the Kingwood Pike daily! We want/need either a turning lane or simply put it back to 4 way stop as it was before. It's a waste of money! Money that should be used to fix the roads we already have!
689	I am completely against this, Aarons Creek cannot handle the traffic this would cause, the road is in poor condition as it is and is very narrow in places. It would be very dangerous, especially to the children in this community, the damage this would cause could be irreparable. The road cannot handle the large trucks, especially if two needed to pass each other. This would cause alot more issues then leaving Greenbag Rd, as it is. It's absolutely absurd to reroute traffic down Aarons Creek.
690	There must be a thorough detail analysis of all reasoning. Too much of nature is taken with little remorse. Also the traffic issue IV been going through the 4 way for many years and never had problem when light was installed. Leave it be
691	The roundabout at Greenbag/Kingwood Pike would be dangerous for the construction period. There is no good alternate route for traffic to come into Morgantown from the Pike especially between route 7 and the bottom of the Pike.
692	I think there are other places that they can use that money. I agree that if traffic is a problem then put in turning lanes
693	I work in Morgantown and travel between there and my home in Kingwood. There is no need for a roundabout at the intersection of Green Bag Rd and the Pike. A turning lane would solve the issue. The roundabout on the Mileground still backs up traffic. People don't use it properly. We don't need one at this intersection. The money would be better spent to maintain the roads we do have. This is not only a costly project, but the time it would take to complete would have a major strain on the surrounding areas. Diverting down Aaron's Creek is not suitable for large trucks. Not to mention, the road is not suitable for that amount of traffic. It took how long to fix the cave in less than a mile above that intersection?!? This will literally drag on for years! The citizens have expressed

	their feelings towards this project time and time again. Yet, you ignore the wants of the public. Shame on you for leaving our roads to crumble just to pat yourselves on the back for putting in a roundabout. Please let those of us who actually drive that road everyday have a say in this. Sincerely, A Disgruntled Citizen
694	I've never understood why such a high-impact solution was favored here or why this was a priority ahead of many, many other issues. I think roundabouts are practical and I'm looking forward to the other instances in Morgantown being brought to their full intended use, but this intersection has always only needed a turning lane and Mississippi Street probably doesn't need anything.
695	I fully support the installation of a roundabout at the intersection of greenbag rd and the kingwood pike. This would provide traffic improvements to support growth in the area and improve the quality of life while living near the intersection. This would also reduce the likelihood of accidents and the severity of any accidents that would occur thus providing for the protection of life in our community. Additional improvements of sidewalks along the road would also improve the community and provide access to safe and healthy alternative transportation in the community and allow for a more connected community for those unable to drive. The elimination of idling vehicles at the stop light would reduce air pollution in the nearby homes and on the school playground. And the the reduction in traffic related stress and commute times for those traveling the roadway could improve community morale. Morgantown desperately needs traffic plans that reduce congestion and encourage connected communities as we grow.
696	I am opposed to the roundabout on Rt857, Morgantown WV, there are no issues from Dorsey or the Kingwood Pike I drive it 5 days a week. Just stagger the lights on Greenbag Road/857 so that people can turn to Dorsey or the Kingwood Pike freely and the traffic will move. No one will mind a longer light, the beautiful setting will remain and the money can be allocated for road repairs, which is a much needed expense. I hope you reconsider; the small farm at the intersection of 857 and the Pike is a wonderful green space in a world where they are shrinking every day. Young folks put gardens in and grow beautiful flowers along the road, it is quite charming and I am sure I am not the only person that enjoys watching the gardens and flowers after a long day of work as summer comes. Choose the farm over the concrete, please. Thanks for listening Barb
697	Don't want a round about on greenbag road
698	I am AGAINST a roundabout on Greenbag Rd and the Kingwood Pike. The traffic pattern could be solved with a simple turn lane. The roundabout on the Mileground has done NOTHING to improve the flow of traffic- neither would one on Greenbag and Kingwood Pike!
699	I live in a housing development along Greenbag Road. I travel Greenbag Road and Dorsey Avenue nearly every day to go to work and back. I am against a roundabout. Adding a turn lane would be more effective and likely, less expensive. Traffic rarely backs up except for peak times in the late afternoon. Even then, delays only average a few minutes. Roundabouts do not work in this area. If you need proof, check out the roundabout on the Mileground between 4 and 6 pm during the week. People do not yield. Cars block the lanes and back-up traffic. Someone needs to actually observe the traffic flow at the site of the planned roundabout. They would clearly see that a roundabout is not needed.
700	I do not support the proposed updates to Greenbag road. I understand the need for changes due to traffic problems at this intersection, but I believe creating turn lanes on Greenbag road would be an equally viable solution that would likely be cheaper and less time consuming.

701	The roundabout is completely unnecessary at the end of Kingwood Pike and Greenbag road. Turn lanes would be more than enough to help the flow of traffic. There is never much wait time at that intersection at all. My family uses that intersection several times a day and have never had any issues. The money for the roundabout would be better spent on turn lanes and fixing all the potholes properly on Kingwood Pike.
702	need safe sidewalks/pathway from Dorsey East to the end of the project
703	No, no, NO roundabout. Please please just put in turn lanes. It only backs up during certain times of day and only for a short amount of time... I understand that in this "Amazon prime" day and age of instant gratification and extreme lack of patience, it can be frustrating but it truly isnt a problem all the time. It wont hurt any of us to have a moment to pause, give us a chance to think, decompress after work, or slow down and catch up on a podcast or audio book. Please please consider turn lanes.
704	Please do not put in a roundabout in at the intersection of Kingwood Pike and Dorsey Ave, it is absolutely not needed. Listen to everyone who is commenting on this. All that is needed are a couple turning lanes. The road that those of us who travel Kingwood Pike daily because we live there are going to be expected to use a road that is NOT suitable for heavy traffic that the Pike handles daily. This does not even include tractor trailers that also travel the road daily. This is going to be extremely dangerous for everyone.
705	it is absolutely ridiculous to waste all that money and destroy land to remedy a few hours of traffic per day.
706	No round about!!!!!!!
707	Please rethink this! A roundabout it not necessary in that area. I have lived near (within a block) of this area my entire life. Please do not destroy the farmland in this area. We do not have much left as it is in town.
708	This area does not have enough continuous traffic to have an absolute need for a roundabout. Then, the idea of detouring everyone to a Aaron's Creek Road, a road that is in no condition to handle any more traffic because it would worsen the current conditions for those that live there and it is a single lane road in some spots. This money could be used to improve the current roads we have and go a long way in benefiting the community. Also, taking farming land from long term residents that feeds said community is government power at its absolute worse.
709	No roundabout!!
710	I am against the roundabout. There is no good detour that would make sense to use for years.
711	Please consider a turning lane. We have a large camper, my husband hauls a large trailer. I have lived on the Pike for 10 years and have never had an issue at the bottom. There is no need to spend all this money on a round about that is not needed!!! Plus, 2-5 years of the Pike being closed at the bottom?!?!?! That is insanity. None of the routes for detours are acceptable for the heavy amount of traffic that will be using it. No to the roundabout!!!
712	The roundabout will not work. Just add a turning lanes or change light to a four way stop. The detours are just a joke. You can't even pass on Aaron's creek. There is no way a bus can do it.
713	I travel the Aaron's Creek Rd frequently to visit my mom and this road is not an adequate option to reroute traffic for 2-5 years during the construction of the roundabout. I feel adding a turm lane on the Greenbag Rd would relieve the traffic issues and save a lot of money and time on this project. Please reconsider the roundabout option in favor of turn lanes.
714	I am NOT IN FAVOR of building a round about at the Kingwood Pike/Dorsey Ave intersection. The Kingwood Pike needs fixed and so does Aaron's Creak Road. How about putting the money, where people who live and use the roads everyday say it needs to go, instead of insisting on something that will make the problem worse.

715	I am submitting comments on the proposed Greenbag Road Improvement Project. The project should not more forward until the proper Environmental Assessment has been revised to consider the following recommendations for impacts. · Correct errors regarding the classification of land use and designation for the Hastings property, including updating all maps and tables that reference prime farmland (farmland of statewide importance), analyzing and identifying the socio-economic effect from the loss of farming income, and identifying the mitigation for both the loss of the prime farmland (farmland of statewide importance) and the loss of income. · Provide information on the post-construction conditions of streams in the project area to accurately quantify steam impacts and stream mitigation requirements. · Quantify and mitigate for impacts from increased stormwater discharge to Aarons Creek and Cobun Creek, which will be impacted even though they are outside the area of disturbance. · Revise the wetland delineation report to accurately describe soil types and expand field surveys to ensure that all wetland (hydric) soils are reviewed in the EA. · Quantify the impacts on wetlands adjacent to the project's limits of disturbance from changes to wetland hydrologic conditions, increased deposition of sediment and pollution, and resulting stress on existing vegetation. · Include and analyze a new option with dedicated left turn lanes for the Greenbag Road approaches and design features, but no added lanes, for Dorsey Avenue and Kingwood Pike. While improving Greenbag Road is an important step for the growing urban area of Morgantown, this project fails to capture the dovetailing of growth and meaningful design with watersheds and farmland. If anything this road project should help facilitate the businesses and farms that comprise this intersection, while minimizing environmental impact. Once we lose these prime farmlands and co-operative spaces, that are an important fabric of our society, they are impossible to replace. Thank you for your time and effort,
716	Please reconsider your plans regarding the Greenbag Rd/Kingwood Pike intersection. The terrain is not conducive to a roundabout. In order to even try to ensure adequate lines of sight and traffic safety, land on one side of the road would require extensive excavation, while the other side would have to be built up. Taking into account the significant amount of heavy truck traffic that is anticipated with current plans to reroute loaded trucks to that roadway, especially when many of these trucks are known to not adhere to weight and speed regulations, creating a roundabout there would be especially dangerous for motorists and pedestrians. Furthermore, when you use eminent domain to acquire the property for such a poorly thought out plan, it is a slap in the face to the property owners, and the entire community.

	I agree that the intersection has issues that need to be addressed. However, it would be much more efficient traffic-wise, less invasive to the landscape, and likely more cost effective to add a turning lane, rather than an ineffective and dangerous traffic circle. For the safety of our community, please reconsider and do not build a roundabout at the intersection of Greenbag Rd and Kingwood Pike.
717	i really angst the round about it is very confusing for me in the traffic ,plus it take a lot of property a way from people and that mean a big spend for our tax money in nothing and it could be fix the problem with easy way by 3rd line adding to the traffic light same as the traffic in Paterson Dr with university Ave ,it is very simple and more modern
718	As a resident of Morgantown and Aarons Creek Road I would ask that the reroute for the roundabout project onto Aarons Creek Road be reconsidered. Aarons Creek Road is not a two lane road and is busy enough as it is. In the event that you meet another car there are not adequate places to pull over to allow another traveler to pass by. The ditches are too deep to pull to the side of the road, even in a 4WD vehicle; therefore the places travelers would be able to pull over are the residents private driveways. This is inappropriate use in my opinion. The road is curvy and travelers already speed. A portion of Upper Aarons Creek and Lower Aarons Creek were paved less than a year ago and already in terrible shape. If the traffic increases on Aarons Creek Road I fear that the conditions of the road will diminish drastically. I am fearful for the safety of myself, my child, my pets and my neighbors with increased traffic on this road. Please do not punish the residents of Aarons Creek Road.
719	Please do not put a round about at the end of the kingwood pike. I do not mean this out of disrespect but I could care less about the farm property, yes its crappy you are trying to take it, but I am more concerned about the well being of my family if a round about is placed at the bottom of the kingwood pike. This is a community full of older generation people that refuse to go to the mileground because they do not know how to drive on a round about and if they do they get hurt from accidents because they are uneducated. I really am concerned for my community and its population. I say no to the round about.
720	I am currently 2 years into a 5 year property lease at the historical Dorsey Farm on the corner of the Kingwood Pike and Greenbag road, in Monongalia County, West Virginia. I would like to make my concerns clear as to how this construction project will impact my business in the state of WV, as well as my personal livelihood and health. I am currently an active Emotional Therapist with a focus on holistic well being. After 10 years of research and experience, I have decided to start my business at the Dorsey Farm which is owned and operated by the Hastings family. I chose this farm because of several imperative requirements which I will summarize below; 1. Clean, running, natural spring water with a pH of 7.0 or above. 2. A minimum of 7 acres of natural, undeveloped farmland that is privately owned and not visible from any road. 3. Access to an active, legal, licensed Cannabis or Hemp Flower farm that uses no pesticides or man made chemicals throughout their process. 4. Access to organically grown produce using a permaculture style process to maximize consumable food that is grown together with Cannabis or Hemp Flower. (Enough to provide for myself and my family throughout the winter) 5. Proximity equal to or less than 20 minutes travel time to my only Grandparent, to whom I am the primary care giver. 6. Parking and facilities for myself and my Emotional Therapy clients. 7. Low light and low noise pollution.

	8. Clean, dry, covered and enclosed workspace to be a minimum of 20' x 40'. 9. Secure storage area for equipment, tools, and supplies. 10. Access to hardwood timber for harvesting. 11. Renewable energy. (Currently using solar power) 12. The ability to directly contribute to my community, my state, and my country via community education as well as organic produce distribution. (Currently involved with 45 different sites at the Dorsey Farm) 13. Isolated acid mine drainage site. 14. Raised deck at a minimum of 24' x 24' to accommodate a Sioux, Native American Tipi. If this plan is to be executed, especially with no negotiations with the Dorsey Farm owners, I will be forced to break my lease, made to be jobless and homeless, and will be left to mitigate these damages that will surely put myself and my family living on the streets as well as negatively impact, or potentially reverse the progress of my business and my clients. This action would force me to start my business over while being homeless. In the midst of a pandemic, it's difficult to see how I would be able to survive. It was very difficult and research intensive to gain access to this historical and unique farmland. If my lease is to be broken; 1. Where will I go that would meet these requirements? 2. How will I afford to sign a new lease, deconstruct, pack, clean, move all materials (requiring a truck bed of a minimum of 24' in length), and rebuild in a new location? 3. What will I do with my brand new business that is just getting launched? 4. Where will my clients go for Therapy? 5. How will I get access to food and medicine that is organically and sustainably grown in a permaculture style environment? 6. Where will my clients, family, and I get access to farmland with this type of historical significance, religious freedom, and community involvement? 7. How will I continue to care for my Grandmother? My family? Myself?
721	I think a traffic circle would work great on Greenbag road and Kingwood Pike intersection. However, it would be much more advantageous to travelers on the Kingwood Pike and from Preston County if you would spend this money on an on/off ramp for I68 at the Kingwood Pike bridge. It would eliminate 90% of the traffic at that intersection.
722	Please add true side paths along Greenbag road so bicycles and walkers can move through the area. Narrow shoulders and side walks are good but not enough. Also slow the speed another 5 or 10 miles per hour for safety. Turn lanes are preferable to roundabouts, they take up less space and work better with drops in elevation. Please connect the sidewalks all the way up Dorsey for school and walker safety. People live here in several neighborhoods and commuting routes, we need both efficiency and safety for all users. Please add true side paths along Greenbag road. Lower speeds 5-10 miles per hour. Turn lanes are preferable to roundabouts. Add sidewalks all the way up Dorsey for school and neighborhood use. People live here. I Vegetable garden in this area in the community garden so am frequently here.
723	Several of us are totally against the roundabout on Greenbag Rd. Its not warranted. If you add turn lanes to Greenbag Rd that would alleviate the traffic issues and create better flow.

724	I have been a resident of Morgantown basically my whole life. I strongly disagree with the planned roundabout at the intersection of Greenbag Road and Kingwood Pike. Though the intersection needs fixed to keep/maintain the flow of traffic, the roundabout is not the best option. The preferred option from the residents of Morgantown would be to add a turn lane as proposed as an alternate option. Based on the information given during the public meeting it appears that all factors were not considered in the evaluation and decision to turn the intersection into a roundabout. There will be a significant amount of time that the residents and those from surrounding counties will be unable to use this route. The proposed detours have not been considered/evaluated for the additional maintenance and cost associated with it to make these detours efficient enough. The detours will also cause traffic issues in other areas due to the huge increase in traffic flow. Though it was stated that the roundabout is the safer option, many would disagree from personal experience of the other 2 roundabouts we have in Morgantown. Another issue is trucking, which is a very common profession in this area, and a roundabout would cause issues for many people that are just trying to make a living. The Hastings farm land and all the people who benefit from the use of it would be directly impacted by the roundabout as well. Farm land is irreplaceable and should not be taken for such a project when there are other options available. In all, the people of this community that use and will be directly effected by this change, strongly disagree with having a roundabout built and prefer to have the turn lane option constructed instead.
725	A roundabout in this area makes no sense. This will only divert traffic to aarons creek road which is in terrible shape as it is. A simple turning lane would do wonders in this area or diverting traffic past the park and around Marjory Gardens the school bus route from south jr high school. Stop cutting corners with dangerous roundabouts. Widen the school bus route and place a light there where it connects in front of the grave yard. Why destroy what little farm land we have in monongalia county.
726	Build the roundabout. Traffic congestion there is horrible, especially if you're trying to turn left at the light. It is definitely a safety issue. I have lived in Morgantown for 40 plus years and have not observed any use of that "farm" until just recently.
727	Why take farmland that has been around for several years and waste 10 million dollars. When a turn lane and or arrow light would be much cheaper. An rerouting traffic on Aarons creek. What a joke.
728	I dont think we need to put around about on greenbag Rd 1st am a tax payer you should be fixing the roads like brockway ave where you let these big trucks destroy our roads and stop patching pot holes fix those roads. On the corner of greenbag road Hastings farm do alot to help the community. I say no to the roundabout.
729	Rerouting that amount of traffic into Aaron's Creek Road will be a terrible safety hazard for an already eroding, unstable and narrow road. This round about project is a very bad idea. Find another solution! No rerouting traffic into Aaron's Creek
730	Please no round about.
731	I am very concerned about the use of a roundabout at the intersection of Greenbag Road and the Kingwood Pike/Dorsey. One of the goals of the Greenbag project was to encourage traffic to divert out of downtown to a broader, safer road. The weight and speed of the trucks that will be speeding down this road as well as their size, makes it likely that the roundabout will simply be avoided for a more straightforward approach. I do not understand how a roundabout will serve the purpose of increasing overall safety. Second, this intersection is at a local school and I do not believe the roundabout is being designed to protect pedestrians who already face peril on Dorsey and Greenbag, where neither has sidewalks. I and many others want this project to successfully manage the traffic in our area to protect pedestrians and protect local streets and roads while facilitating safer transport of overweight loads. Please consider addressing the safety and transport needs of our community by widening the road, slowing down traffic and adding turn lanes. We know that our goals and aspirations for this space are the same. Thank you

	for all you do and best wishes. Rachel Fetty
732	No round about
733	About three years ago I met the Hastings and at this point I knew nothing about nature, growing, farming, working hard, dedication and really understanding the agriculture aspect for now and our future. I've also grown and many other aspects of my life and tremendously I'm doing fairly well myself now. I live on this little farm in a tent and every night it's quite peaceful out here growing and becoming one with nature. I also know I walk to work on a daily basis and believe me it almost seems like these drivers are more in a rush and let's not forget to mention there's a school right here and no one bothered to think about putting sidewalks then for the Bluegrass and Marjorie Gardens community. There's definitely a more resourceful and most efficient way of handling this situation. So because I live in a tent on the field where the roundabout would supposably go, this will majorly cause a significant impact not only in my future and spiritual growth process but also furthering mine and everyone else's education towards agriculture and the potential to bring the community together as a whole which the world desperately needs right now. I would not have access to another place without a lot of work to move clear and level out another location and the damages should potentially be awarded if decided by a judge of court. Sad to watch people driving their cars heading nowhere fast not even realizing life and the bigger spectrum of things. I'm fully aware of the non existing sidewalks that should have been constructed a long time ago. At this point it's not the matter of right and wrong but simply looking at it for what it is. Truthfully we think we know what's best for everyone but in all reality this is a learning process for everyone to learn and grow and experience something greater than our perception of how we view the world today. Just know Mother Nature is within all of us and maybe it's time to take two steps back and ask yourself what would Mother Nature and our ancestors want. I humbly ask to reconsider and try reaching out to the community on a spectrum where something magnificent can it be done instead of us trying to throw money at a situation that we know it's not going to work for anyone in the long run. We should definitely look towards other options as well as cross-guards during and after school hours and of course turning Lanes. Yes: Turning Lanes, Sidewalks, and school crossing guard. Crossing Guards helps pedestrians and bikers cross the street safely. ... A crossing guard is the role model of crossing safety, teaching school kids and others how to safely cross the intersection. One of the important tasks of the crossing guard is to assist in risk management by alerting authorities of safety hazards. Turn lanes are traffic lanes that allow you to make a right or left turn at an intersection or to a side-road. Turn lanes are controlled by road signs

	and pavement markings that show you the direction of travel from the lane. Regulatory road signs that control separate lanes are known and lane-use control signs. No: Roundabout on greenbag road and Kingwood pike
734	Horrible idea. Especially rerouting traffic through Aaron's creek. Have you all not traveled Aaron's creek? Not a good idea by far.
735	Not in favor of roundabout at all!! NO! NO! Do NOT let Aarons Creek Rd be route for Greenbag Rd intersection roundabout project!!! It is a ONE lane road!!! HAS ANYONE in charge of this project driven this road? If so, I would hope they would reconsider everything to do with this WHOLE project!!!
736	This is a horrible idea!! Aaron's creek is in very bad shape. There is no way a one lane road will be able to handle all that traffic. A roundabout is very bad solution to Greenbag road. The roundabout on the mileground has solved nothing, traffic still backs up.
737	My name is Steve Runfola and my family, neighbors and I must use Cobun Creek/Upper Cobun Creek Road 119/6 to access our homes. We have been reading your Greenbag Road EA.August 2020 document and we see that Aaron's Creek Road is named as a possible Detour for The GreenBag Roundabout project yet Cobun Creek Road is not named as a possible detour for the project. Cobun Creek Road is about 3 miles long and connects Kingwood Pike and Grafton Road. The Grafton Road/Cobun Creek intersection is about 50 yards from the Kingwood Pike bridge over I68. The Grafton Road/Cobun Creek intersection is next to Allied transfer and storage about 1 mile from Walmart. It is impossible for my neighbors, family and I to believe that Cobun Creek Road will not be used as a defacto detour during roundabout construction. People will use this road heavily no matter if it is an official detour or not. In the past we have all seen it used heavily for brief periods as a detour during road construction and automobile wrecks. Cobun Creek road in now being heavily used by light trucks busses and cars for MUB dam construction traffic and Upper Cobun Creek Rd is being used for heavy MUB dam earth moving and construction machinery traffic . At this point, Upper Cobun Creek has been virtually destroyed and Cobun Creek is not much more than a pig path. This has been going on for 2.5 years. The Greenbag road detour situation will force us to endure another 2 years of very heavy traffic after the MUB dam construction ends. We find that unacceptable. We also think it's a very good idea if The County and the DOT contact us if our area is to be directly impacted by major maintenance or construction. None of us had any idea that Cobun Creek may be used as a long-term detour and so no one that I know of attended the Roundabout meetings. My name and contacts are Steve Runfola M: 1-304-680-1340 Email: StevenRunfola@Gmail.com . Thank you for your service and have a good day.
738	Using Aarons Creek as an alternative route is not a viable option. The road is narrow and has been in disrepair for years. It is not suitable for traffic or heavy trucks. With increased traffic emergency response will be greatly hindered to the dangerous level. A roundabout these days seems to be the fix all rather than do the right thing and install turning lanes To allow traffic to flow through. Please consider this as notice of my disapproval of a roundabout at the kingwood pike/ Green Bag road intersection. I urge you to investigate a more common sense approach.
739	Everyone one knows the detour will not be able to handle the traffic.Winter time will be a joke! Keep those wreckers handy.
740	The proposed roundabout is one of the worst ideas I've yet to see or hear about here in Morgantown. The people who are in favor of it are definitely not resident of the Pike nor will they feel or experience the repercussions of something so mindless AND wasteful. This project is

	downright a waste of tax payer money. It makes absolutely no sense. Why are would anyone in their right mind spend MILLIONS of dollars on an area that is MAYBE AT MOST congested for an hour 5 out of 7 days a week. I don't know why a turning lane can not be installed or bring back the four way stop signs there - literally ANYTHING not as so drastic and daunting as a roundabout. I feel like the people are not being heard and those we've elected into office are failing us in being our representation. It's really a horrible thing when you have no say in something that will affect your daily live and may I add negatively. Here's just a few of the reasons why the roundabout is a ridiculous idea. There are many large trucks that travel the Pike daily. A roundabout will be a nightmare navigating with the heavy loads they carry. It scares me to think I'd have to share the road with a fully loaded truck in a roundabout at that location. This brings me to my next point. During the winter, that grade of hill along with the twists and turns is NOT suitable for a roundabout. I can see many sliding right through it causing damage to the structure itself and possible accidents with other cars. I actually have to plan ahead when coming down that hill in order to stop when I need to. If you go up to Pike not even a quarter of a mile, the roads are horrible!! They're falling over the hillside and the potholes are horrendous. I have to drive in the other lane to avoid popping a tire or destroying a rim. Also, that road does not drain properly. It's a hazard year round with laying water. You need to fix the roads before adding a roundabout. The proposed detour is an absolute joke. Whoever proposed this project and detour, have you tried the detour?! I'm serious. I won't want to leave my house if that's the only way to get down the Pike. I refuse to drive it because of how dangerous it is. Then to think additional traffic will be on it because of the detour, wow, you're really asking for accidents and a negative outcome. I am NOT in favor of this roundabout. Anyone who lives on the Pike knows this is a horrible idea and waste of our money. Please consider fixing the roads first. I honestly can not believe this roundabout is an actual thing. Whoever is pressing forward with this project should be ashamed of themself for not listening to the people that this affects most.
741	HAVE YOU CONSIDERED THIS? I am a homeowner on Aaron's Creek Rd, and in fact my driveway meets Aaron's Creek Rd and Summer School Rd. My family struggles to get out of our driveway now, and the speed at which most cars travel past is unbelievable most of the time. I have witnessed in excess of 50 accidents and have literally pulled accident victims out of their cars! In the past I've contacted the DOH to repair the potholes in front of my house as I am concerned that one day a vehicle will hit one and roll into my front yard onto my vehicles. To date nothing has been repaired! This road is horrible, and school buses are currently not permitted to travel it! What do you plan to do with school buses traveling down the Kingwood Pike to the schools in Morgantown? Do you plan to put them in danger also? You have not announced what you plan to do to control traffic through here! Do you plan to put a stop light at Summer School? If not, for the next 2+ years we will be in more danger than before! I know you put a traffic counter at lower Aaron's Creek Rd, but did you leave it there for a full 7 days? If not, you absolutely missed a full count! This road is a main route to the Sabraton area from the Kingwood Pike. I have lived on this road since 1989 and traffic has multiplied astronomically since then, and I have traveled to work to the Kingwood Pike to get to Morgantown. The 4 way stop at Greenbag and Kingwood Pike was not a problem, as most people just took their turn to get through. Turn lanes on Greenbag Rd and the Kingwood Pike absolutely make more sense, as well as stoplights with sensors to control the amount at any given time rather than spending millions of dollars for one area to make another area worse! I implore you to reconsider the roundabout as the best option and make turn lanes instead. I also would like a reply as to what you plan to do to Aaron's Creek Rd in the near future. Thank you in advance for your reply.
742	"Need safe sidewalks/pathway from Dorsey East to the end of the project" would be helpful. Thank You.

743	Dear DOT Representatives: I write to express objection to the proposed roundabout on Greenbag road. The proposed project would destroy the greenspace that the Hastings family and Conscious Harvest Cooperative use for the community garden. This space has a significant positive community and economic impact. The Conscious Harvest Cooperative and the Hastings family have rallied a large segment of the community around gardening, food access, and the value of community. The impact they have on the community is no less than that of an established church or social service organization – helping to gather people for healthy activities, donating food to the poor, educating via workshops, and preserving greenspace in an urbanizing area which helps public mental and physical health. This space has also allowed Conscious Harvest to have a significant economic impact by supporting growth of small businesses, including ours. Through their programming and fundraising, for the past several years Conscious Harvest Cooperative has raised funds to purchase several thousand dollars of biweekly food boxes from our farm business that we then provide to qualifying low-income families through a "Farm to Families" partnership we have with the Shack Neighborhood House. In this way, Conscious Harvest and the community garden space have had a significant economic impact on our business and on the daily budget of many of low-income Morgantown families. We are also aware of at least two entrepreneurial endeavors that have been incubated directly at the greenspace and grown into local food and farm-based businesses. If this greenspace is eliminated for the proposed roundabout project, Morgantown will lose Conscious Harvest Cooperative's valuable efforts to promote community, support economic growth of small businesses like ours, and directly incubate other farm and food-based businesses. This will have a direct economic impact on our business and others, and will also negatively impact the low-income families who we provide food to through this programming. Thank you for considering these economic and community impacts. We hope you are able to rework the project to avoid negative impact to this greenspace and Conscious Harvest Cooperative. Sincerely, Ruth Mary Oldham Mountain Harvest Farm
744	I feel the round about is a horrible idea! All that is needed is a turning lane on greenbag road side. Aarons creek road can not handle all the traffic! It itself need much needed repair and repaved. It is not big enough to pass in most places! I
745	I recently read in the paper this project will negatively impact a historical farm on Greenbag Road. Morgantown was once a thriving farming community. Farming has been all but expelled from the city limits of Morgantown due to the demand for housing and the expansion of WVU.

	While the Hasting's farm too is outside the city limits, it does sit on the boarder and remains one of the last reminders of what Morgantown once was. In the drafting of your final plans I sincerely insist you consider the negative impact your project will have on a multi-generational farm.
746	All we need is a turning lane. Drive up the pike the road is falling apart use the money to fix the road. NO ROUND ABOUT
747	We don't need a Roundabout take the money and put in turning lanes and do what really needs done pave the Kingwood Pike.
748	We don't need a Roundabout just turning lanes and fix/pave Kingwood Pike
749	My name is Orlando Cruz About three years ago I met the Hastings and at this point I knew nothing about nature, growing, farming, working hard, dedication and really understanding the agriculture aspect for now and our future. I've also grown and many other aspects of my life and tremendously I'm doing fairly well myself now. I live on this little farm and every night it's quite peaceful out here growing and becoming one in nature. I also know I walk to work on a daily basis and believe me it almost seems like these cars are more in a rush and don't even know how to approach a stoplight like this one. Quite funny until I get hit by car so it's more than just a roundabout. Really sad to watch people driving their cars heading nowhere fast not even realizing life and the bigger spectrum of things. At this point it's not the matter of right and wrong but simply looking at it for what it is. Truthfully we think we know what's best for everyone but in all reality this is a learning process for everyone to learn and grow and experience something greater than our perception of how we view the world today. Just know Mother Nature is within all of us and maybe it's time to take two steps back and ask yourself what would Mother Nature and our ancestors want. I humbly ask to reconsider and try reaching out to the community on a spectrum where something magnificent can it be done instead of us trying to throw money at a situation that we know it's not going to be work for anyone in the long run. Sincerely Orlando Cruz
750	Dude. What the heck is this I hear about an extremely expensive and useless roundabout next to your farm? When I visited you about a month ago I recall you saying the proposed roundabout would potentially kill your farm! Please forward this email to whoever needs to hear how DAMN beneficial your cbd products are for me! For one, when Tito my lil chihuahua, pulled his acl your cbd tincture IMMEDIATELY helped him with his pain and stiffness. I've been continuing to give him that tincture on his food since the event a only gotten so much stronger, healthier, and happier. You have by far the most affordable cbd products and it will be a true financial impact on me if I have to get cbd products from our local farmer's markets here in CO. They charge unreasonable prices for less than half the amount you supply me with. The cbd tincture I've also given to my father who some would call an alcoholic and we've all seen a drastic improvement in his mental and his urge to drink. He now goes days without drinking when it was a several drinks per night occurance. Lastly, I think I read this is going to cost the townspeople 10-miilion dollars in taxes. Are your local politicians idiots?! When I visited you, I recall exactly the light they're considering this roundabout for and it had ZERO back-up. I was there from Thursday through Monday a nd saw the rush-hour times at that intersections and there were never any issues with back-up.

	Please, please, please send this email to someone that has some common sense and compassion for local farming, because someone's clearly getting bought out to suggest such a stupid construction project. I live in Fort Collins CO, well you know of course, we grew up together lol, and we have a significantly higher population and the roundabouts put in place here, that weren't putting local farms AT RISK of being closed, are hated by everyone. People don't know how to use them correctly and I can only imagine how useless and devastating this roundabout on your farm will be. Please send this to someone that has a say in things.
751	Roundabouts are generally bad ideas in the US, but particularly when it is unlikely the roundabout will accomplish the intended goal when a far less expensive alternative is available. In this case, a roundabout will cost a great deal more than a turning lane, and is not likely to reroute truck traffic or reduce traffic wait times more than a turning lane would.
752	Please add a pedestrian crossing to the Greenbag Road development plans. Thanks
753	This roundabout is a horrible idea! With all the log trucks, cement trucks, and large equipment trucks traveling the pike for the sawmills and building of the Cobun Creek reservoir this idea will cause some big issues. I have lived in the area for 36 years and we try to avoid Aaron's creek road because it's so narrow and full of potholes and now we're supposed to use it daily for up to 2 years? We have nice vehicles we pay taxes on and we don't even have nice roads to travel on even though we pay taxes for that as well. All of the connecting roads to this intersection need repaired way more than we need a new pointless intersection. The intersection that is there now isn't very old and works fine. It is also a shame that it will cut into the people's farm property that they actually use.
754	the roundabout would cause a hardship on a family farm along with it not making sense for the truckers. A turning lane is more appropriate and logical.
755	White Park to Dorsey's Knob/Sky Rock is a key connector trail for hiking and trail running. Potential routes require crossing Greenbag Rd. Please add a Greenbag Rd pedestrian crossing to the plans for Greenbag Rd.
756	I am in support of the Greenbag Road Improvement Project as proposed.
757	Please consider making Greenbag road safely accessible to bikers and pedestrians for the entire length of the road. This Will provide safe access to schools and businesses for those who do not drive, and it will undoubtedly create a valuable resource for the community. As an avid cyclist I never ride Greenbag because it is too dangerous. This prevents access for me to certain areas. Thank you!
758	I encourage DOH to build a place for people of all ages to safely walk and bike on the entire length of Greenbag Road so people can safely access the schools, parks, and shopping areas along that stretch of road on foot or by bike.
759	We need a safer way to walk and bike to school. Now is a great time to make Morgantown a bike and pedestrian friendlier city.
760	1. Would kindly ask that a sidewalk also be included to the east of Dorsey/Greenbag intersection, as this is a treacherous stretch with, as i see it, no solution in the proposal. 2. Cross walk b/ SafeLite or Good Year to Giant Eagle would also be helpful. 3. How wide is the propsed sidewalk along Greenbag? Space enough to accomodate cyclists and pedestrians would be helpful, particularly given how much traffic there is on that stretch.

	Thank you for the opportunity to voice these concerns.
761	I'd like to submit these points for design consideration: First off I do not support any type of roundabouts. Just a terrible idea. I would however like to see the following improvements. 1. Sidewalk the entire length of the north side of Greenbag is a good option for pedestrians, though a multi-use path would be much safer. 2. I would like to see a sidewalk on the east side of Dorsey, connecting Greenbag to Luckey Lane and Mountainview ES 3. I would like to see a sidewalk the entire length of Luckey Lane 4. The lack of pedestrian and bike infrastructure is a major concern. I would like to see at least a sidewalk on the north side of Greenbag or a 10-12' multiuse path on the north side of Greenbag from the Dorsey intersection to the eastern end of the project. 5. I would like to see a safe pedestrian crossing from the western terminus of the sidewalk on the north side of Greenbag (near the Goodyear Auto building) to the south side of Greenbag (Giant Eagle/mall). Pedestrians and bicyclists need to be supported along this entire project with a 10-12' multi-use path or sidewalk separated from traffic in many areas.
762	The roundabout is not needed. The road is only backed up Monday thru Friday for 15minutes. This does not warrant spending 10-15 million dollars. A few years back someone decided to put curbs up a short distance on the Kingwood Pike from the 4-way intersection. These curbs made travel treacherous in the winter, Water does not drain into a ditch but onto and down the road. Resulting in a sheet off ice going down hill at an angle.... THIS needs rectified above everything else. I DEMAND that each and every counsel member travel the "proposed" detour of Aaron's Creek BEFORE any decisions are made. Aaron's Creek is a one lane (in some cases 1/2 lane) road with a steep angled grade with NO GUARDRAILS!!!! I do not travel this road dry let alone wet or in the winter time. You will be putting the safety of all the kids that rides school buses that have to travel this road in danger! Wake up! Think of others! This will not deter trucks from going through town, AT ALL. We have ALOT of log trucks that travel the Pike, how do you think a roundabout will work out? Log trucks full of logs going through a roundabout????? They will for sure have to use both lanes to do so. The only appropriate solution to remedy the inconvenience of those have to waiting in traffic for a short time are TURNING LANES!!!!
763	Let's build it!
764	My family and I are avid outdoor enthusiasts. My three boys attend Mountainview Elementary, South Middle, and MHS. We frequently drive Greenbag Road, but in its current state, we would not dare ride our bikes or walk it. With the proposed changes to the Greenbag Road, I encourage DOH to build a place for people of all ages to safely walk and bike on the entire length of Greenbag Road so people can safely access the schools, parks, and shopping areas along that stretch of road on foot or by bike. With such simple improvements, so many will be positively impacted. Let's make Morgantown even better!
765	I've read through the EA document. This process has been in planning for a long time, and I was happy to see so much thought and effort in presenting different options for improvements that are necessary as our city continues to grow. In the document itself, there is the admittance of a negative impact due to widening the road and affected the streams, wetlands, and water quality in the area.

	While this is to be expected from new construction, I was disappointed to not have found a comprehensive plan to improve water quality and enhance our natural resources in this area. If any time is right to work sustainable measures into designs; it is now. West Virginia needs to thrive in promoting and sustaining its natural resources, not just as a principle, but for economic reasons. Our natural resources are the pinnacle of why we have so much tourism. That stewardship starts at the local level, and we need to set an example for the rest of the state for how to protect our most precious asset. So I can't agree with the current plan when the language in it is resigned to negative impacts only as it relates to natural resources. If this plan took a proactive approach to water quality and environmental restoration then I would stand behind it fully. In looking at the plans I am confident that these experts in civil engineering can create a plan that is cohesive with the environment. The added cost for such planning and design would be returned to us as residents in increased land value and create demand for people to move into our state. Imagine if we took initiative in this way to be creative with our plans for growth and infrastructure. The cost we will continue to pay for the health of our neighbors will only grow if we continue our apathy towards protecting the environment. You only have to look as far as Fairmont to see what happens when we ignore the health of our natural resources. The cost to our state by sacrificing these resources cannot be counted. While there may be federal protections for these area streams; I believe I am speaking for all West Virginians in saying that we don't want you to meet minimum guidelines. We have more pride than that. Come up with a plan that would improve water quality post-construction, or don't proceed.
766	Round-a-bouts in Morgantown are not the solution -- they are the problem. Unequal flows of traffic from different sides cause congestion and this is exactly what is going to happen. I urge you to rethink a round-a-bout on Greenbag Road/Kingwood Pike and also Mississippi Street. Thank you for your consideration.
767	We are vehemently opposed to the proposed roundabouts to be constructed on Green Bag Road and urge those in the decision-making process to terminate these roundabouts. First, why not simply create turn lanes on each side of the intersections as an alternative, thereby saving time and resources. Second, these savings could be used to improve nearby roads that are in terrible condition and may never be improved once these roundabout funds are expended. Third, the unintended consequences occurring during the construction of the roundabouts, of which there are many, are simply unacceptable. For example, on the Green Bag/Dorsey roundabout, diverting traffic onto the Kingwood Pike, then onto Aarons Creek, followed by Lower Aarons or Upper Aarons Creek Roads will create safety hazards of unmeasurable magnitude, as the volume of traffic vastly exceeds the capabilities of the Aarons Creek Road segments being used as a detour. Fourth, once the roundabouts are completed, will there be any attempt to fix the detour roads that were further degraded from dramatic increases in use. I doubt it! Has anyone done a study to determine these potential consequences? Finally, isn't it time for the local bureaucracy to embrace the

	concept of Occam's Razor for once; that the simplest solution is generally the best solution. If something absolutely must be done, then BUILD TURN LANES!
768	There is no need for a roundabout at the intersection of Greenbag Rd and Kingwood Pike/Dorsey Ave. To say that safety is the biggest issue, with large truck traffic following at a close second is laughable. A roundabout will not deter truckers from using the area and safety of roundabouts is highly questionable. Widening the roadway at and approaching the intersection to install turning lanes with new signals will be the most appropriate solution to this traffic problem in this area. Even as the intersection functions currently, there are no issues with the flow of traffic with the exception of the busy times for a couples hours a day. It doesn't make much sense to spend years and millions and millions of dollars worth of taxpayer money to "fix" the problem. In addition, the use of Aaron's Creek Road as a detour is absolutely ridiculous! That road is a high traffic cut through anyway and now adding all the detour traffic means more accidents, etc with the condition of road. Has anyone looked at the condition of the road? Will there be road improvements such as widening, drainage and paving prior to the detour? This road CANNOT handle that amount of traffic without improvements. Also, the cost of the improvements to Aarons Creek Road in addition to the cost of the roundabout is asinine. Widening and turn lanes for Greenbag is a much more logical solution to your problem.
769	I encourage DOH to build a place for people of all ages to safely walk and bike on the entire length of Greenbag Road so people can safely access the schools, parks, and shopping areas along that stretch of road on foot or by bike.
770	I encourage DOH to build a place for people of all ages to safely walk and bike on the entire length of Greenbag Road so people can safely access the schools, parks, and shopping areas along that stretch of road on foot or by bike. This would be a major asset to our community, particularly so that my kids attending Mountainview and South Middle school can safely access resources such as White Park and stores in the Mountaineer Mall.
771	We are advocating for an alternative intersection design that can be supported by the majority of landowners affected. The name of this design is "Option G." We believe this design is what has been promised from the State to landowners for over ten years. Here is "Option G" in clear language: The Environmental Assessment (EA) considers three alternatives for the intersection of Greenbag Road with Dorsey Avenue and Kingwood Pike: Options D, E, and F. Another option should be analyzed and included in a revised EA that combines dedicated left turn lanes for Greenbag Road (as in Option D) with the design features, but no added lanes, for Dorsey Avenue and Kingwood Pike described in the Executive Summary of the EA. These design features include widening traffic lanes, adding sidewalks on Dorsey Avenue, and adding a paved shoulder on Kingwood Pike. This new option would have numerous benefits. It would: · improve the safety and access for motorized and non-motorized connections; · reduce impacts to natural resources; · preserve significantly more of the adjacent farmland of statewide importance;

	· reduce the amount of impervious surface, causing fewer impacts to nearby streams and wetlands; · limit impacts to existing residences and businesses on Dorsey Avenue and Kingwood Pike and account for additional historic and cultural preservation; and · reduce construction costs.
772	test
773	While I am excited that the GBR corridor will see some improvements I'm left sitting here thinking about how WV always seems to build infrastructure without significant thought to pedestrian/bike traffic that would ease the load on what is already overburdened roads. There should not be any consideration of improvement along this corridor without sidewalk and dedicated bicycle lanes as part of it. There are large communities of residents that could easily walk or bike to Mountaineer Elementary School, South Middle School, and continue up the road to Family Dollar, Giant Eagle and other business. It seems all mention of sidewalk of any kind stops at Lucky Lane providing sidewalk access only from the west. The majority of residents actually live to the east with four subdivisions and a large apartment building complex to the east of lucky lane. You must extend the sidewalk and I would suggest dedicated bike lane the full length of the project. I am a bicycle commuter and utilize this road often to get to work. I see other cyclists also regularly using this road but the narrow lanes and amount of truck traffic make it unsafe for any but the most courageous. A bike lane would provide access to all of those residents to white park in addition to other services and shopping. If the sidewalk (or preferably bike line) are not extended the full length of the project while it is in construction, it will never get done and we will be left with additional expansion projects along the corridor with no ability to add because there would be a significant gap in the existing infrastructure to do so. Additionally, it would be beneficial to the number of residents who live in the area to post "no engine braking" near the corner at Morgantown Printing and Binding. The increased number of trucks along this corridor is already making the noise level problematic and this will further detract from the existing residential neighborhoods. As to the structure of the intersections, I am extremely disappointed in the development of the roundabout near the old atomic grill because it takes so much of the farm that has been described as (a non-productive farm). For many years now this farm has been supplying thousands of pounds of locally grown produce to food pantries in the area to help those among us experiencing food insecurity and an opportunity for community members to provide for others through their gardening expertise. However, I do believe the roundabout would be the best solution for traffic. The second option for a dedicated turn lane with dedicated signal lights would be sufficient for the amount of traffic currently being experienced at this intersection. Those turn lanes would need to be of sufficient length to accommodate the number of vehicles needing to turn and would likely be best if they continued on as middle turn lanes for the full expanse of the proposed updates.
774	I own two businesses on Lower Aaron's Creek Rd. This road is mostly single lane and is not in good repair. The thought of rerouting traffic onto Lower Aaron's Creek is asinine at the least. Before doing this the road should be widened and resurfaced. The bottom line is a roundabout is not needed at that intersection when you could just widen the road by 10 feet in each direction and add a turn lane. Also, I read that the roundabout is designed to handle tractors with 48' trailers. Considering the average semi-trailer is 53' I wonder about the qualifications of your engineers.

775	I encourage DOH to build a place for people of all ages to safely walk and bike on the entire length of Greenbag Road so people can safely access the schools, parks, and shopping areas along that stretch of road on foot or by bike.
776	I encourage DOH to build a place for people of all ages to safely walk and bike on the entire length of Greenbag Road so people can safely access the schools, parks, and shopping areas along that stretch of road on foot or by bike!!!!!!!
777	Improvements on Greenbag Road can demonstrate a 'complete street' model facilitating auto, bicycle, pedestrian access and innovative stormwater management. Connecting pedestrian and bicycle access from housing to retail businesses and schools needs be a priority.
778	This is going to cause a big hassle and problems for my families
779	Updates to the Greenbag Road corridor will be a much welcomed improvement to transportation in the region, as it is a main E-W corridor in the southern Morgantown metro area. I frequently travel Greenbag Road for purposes of work, shopping and taking my children to school, and I visit many of the establishments along Greenbag Road for numerous errands and community events. I support the roundabouts as designed, especially as they will address the currently obstructed view at the intersection when heading south on Dorsey - this makes a right hand turn dangerous, particularly when large vehicles (school buses or Mountain Line buses are turning left onto Dorsey from Greenbag (or turning right for that matter). Sidewalks or multi-use path are sorely needed along all roadways in this area. I can't tell you how many near misses I've witnessed and experienced along Greenbag Road and Lucky Lane, which is particularly troublesome in the vicinity frequented by school children and school busses heading to Mountainview Elementary. There is a lot of high-density housing in the area between the intersection of Dorsey and Mississippi Ave with Greenbag Road. As such, many people walk this stretch of Greenbag road at all hours of the day. Particularly in the winter, when it gets dark during the high volume times of the day (~7 am and 5 pm), pedestrians and cyclists are forced to walk or ride in treacherous conditions. I hope any improvement to this Greenbag corridor will considerably improve the safety of pedestrians and cyclists by including a multi-use path. Also, events at Mountainview Elementary are unnecessarily unsafe due to traffic routing via Luckey Lane and Greenbag Road which lack sufficient pedestrian access. This has been heightened by opening of the Family Dollar that increased foot traffic across Lucky Lane. Sidewalks along Lucky Lane are needed, as is a cross-walk near the Family Dollar access.
780	Like many in my neighborhood, I am very opposed to the roundabouts that are planned on the Greenbag Road. This area needs to be more pedestrian friendly, and a roundabout is moving in the wrong direction. There are neighborhood businesses, dance studios, yoga studios, a grocery store, that we could all walk to if there were sidewalks. I'm also opposed to taking the farmland from the Hastings family - they have built a viable business from that land and it's moving in the right ecological direction. As we said years ago when the traffic light was installed at the intersection with Dorsey and Kingwood Pike, a turning lane and left-turn signal would clear up the few problems that develop at that intersection. A cheaper solution, and the money for the roundabout could be used to fix up roads that more in need.
781	Please provide pedestrian and biking access/travelways the entire length of the redesign project. My family lives within walking distance of Greenbag Rd. It would make a huge difference to us and our neighbors to have better, safer, healthier access to schools, parks, and businesses along this route. Specifically, I would ask you to include:

	1) sidewalk the entire length of the project on the north side of Greenbag is a good option for pedestrians, though a multi-use path would be much safer and encouraging for the average pedestrian or bicyclist 2) the sidewalk as designed on the east side of Dorsey, connecting Greenbag to Luckey Lane and Mountainview ES 3) sidewalk the entire length of Luckey Lane 4) I fully support the roundabouts as designed. I hate to see the loss of land for the community farm but understand why that is the chosen alternative 5) (a) a 5' sidewalk on the north side of Greenbag + paved shoulders or bike lanes on both sides, or (b) preferably, a 10-12' multiuse path on the north side of Greenbag from the Dorsey intersection to the eastern terminus of the project to connect the schools to hundreds of residents in the housing developments that are accessed from Jonathon Lane, Ashworth Lane, and Long Branch Drive. ---Alternatively, if the Luckey Lane to Dorsey Ave section is absolutely impossible for ped/bike infrastructure along Greenbag, then please include, at a minimum, a sidewalk or multiuse path from the Luckey Lane intersection w/Greenbag to the eastern terminus of the project 6) <<From Dorsey intersection to the west>>: I appreciate the bicycle accommodations (3-4' shoulders), but those will be very uncomfortable for the average bicycle rider because of the proximity to high speed and volume of traffic. I'd ask that an alternative be considered that could support both pedestrians and bicycle riders ---> a 10-12' multi-use path, separated from the road (rather than the ~12' of paved shoulders & sidewalk that are currently proposed from the Dorsey intersection, westward) 7) <<From Dorsey intersection to the west>>: I strongly recommend a safe pedestrian crossing from the western terminus of the sidewalk on the north side of Greenbag (near the Goodyear Auto building) to the south side of Greenbag (Giant Eagle/mall) - a HAWK signal is a good recommendation. This could serve significant community interest in connecting White Park by trail to Dorsey's Knob park & trails. Pedestrians and bicyclists of all ages and skill levels should be supported along this <entire project corridor>, ideally with a 10-12' multi-use path separated from traffic on the north side of Greenbag, alternatively by using a sidewalk and two paved shoulders. Thank you for your consideration, Gwen Bergner
782	I don't understand how this project could get approved. There is a working farm and business at this intersection that would be destroyed if this project goes through. This is totally unacceptable.
783	Greenbag Road is a major connector and can complete the Morgantown loop making travel in Morgantown quicker and easier. I have two dreams for this road, though seemingly incompatible, I think with some planning quite possible.

	1) Connect the Deckers creek rail trail with greenbag road with a separated ped/bike path 2) Strongly encourage the trucks to take this route instead of through downtown. For god's sake we can never raise the bar in morgantown without redirecting the trucks. They are an absolute obstacle to prosperity.
784	These road upgrades are not necessary and will shut down a locally owned business that is beneficial to our community.
785	I am friends with the owners of the hemp farm and CBD business. I am familiar with this intersection. I do not see how a round about would be beneficial for this particular intersection, especially when it would cause and entire family to lose their farm and business.
786	I'm very glad to hear of the intended addition of pedestrian and bike infrastructure along Green Bag road. Pedestrian and bike infrastructure along green bag road are vital to allowing/promoting growth (and realistically limiting the decline) in these sections of town. There is currently ZERO safe pedestrian access to any of this part of town. However, it is incomplete and unfortunate to not include some form of pedestrian access east of Dorsey (even if not directly on Green Bag). In brief, supporting the suggestions of Christiaan Abildso: I'd like to respectfully suggest these points for consideration in the design: 1) sidewalk the entire length of the project on the north side of Greenbag is a good option for pedestrians, though a multi-use path would be much safer and encouraging for the average pedestrian or bicyclist 2) I fully support the sidewalk as designed on the east side of Dorsey, connecting Greenbag to Luckey Lane and Mountainview ES 3) I fully support the sidewalk on Luckey Lane, but would like it to extend the entire length of Luckey Lane 4) I fully support the roundabouts as designed. I hate to see the loss of land for the community farm but understand why that is the chosen alternative 5) <<From Dorsey intersection to the east>>: the lack of ped/bike infrastructure on this section of the project is a major concern and contrary to public feedback as noted above. Thus, I strongly recommend (a) a 5' sidewalk on the north side of Greenbag + paved shoulders or bike lanes on both sides, or (b) preferably, a 10-12' multiuse path on the north side of Greenbag from the Dorsey intersection to the eastern terminus of the project to connect the schools to hundreds of residents in the housing developments that are accessed from Jonathon Lane, Ashworth Lane, and Long Branch Drive. ---Alternatively, if the Luckey Lane to Dorsey Ave section is absolutely impossible for ped/bike infrastructure along Greenbag, at a minimum a sidewalk or multiuse path is requested from the Luckey Lane intersection w/Greenbag to the eastern terminus of the project 6) <<From Dorsey intersection to the west>>: I appreciate the bicycle accommodations (3-4' shoulders), but those will be very uncomfortable for the average bicycle rider because of the proximity to high speed and volume of traffic. I'd ask that an alternative be considered that could support both pedestrians and bicycle riders ---> a 10-12' multi-use path, separated from the road (rather than the ~12' of paved shoulders & sidewalk that are currently proposed from the Dorsey intersection, westward) 7) <<From Dorsey intersection to the west>>: I strongly recommend a safe pedestrian crossing from the western terminus of the sidewalk on the north side of Greenbag (near the Goodyear Auto building) to the south side of Greenbag (Giant Eagle/mall) - a HAWK signal is a good recommendation. This could serve significant community interest in connecting White Park by trail to Dorsey's Knob park & trails. To summarize, pedestrians and bicyclists of all ages and skill levels should be supported along this <entire project corridor>, ideally with a 10-12' multi-use path separated from traffic on the north side of Greenbag, alternatively by using a sidewalk and two paved shoulders.

	I greatly appreciate the opportunity to comment on a project that will have a major impact on our area for decades. Many of us have been working for improvements throughout the entire region for pedestrians and bicyclists, and this corridor is a critical piece of the puzzle. Thank you!
787	The land in which the state is trying to build on is someone's (Jenn Hastings) property. She uses the land as a farm to grow product in which she sells. She has a company to sell her products that work for many individuals. The farm would be in danger with this road going in. Causing a loss for her very real and helpful company. It is important to stop this construction as the farm is what she grows her product on.
788	I encourage DOH to build a place for people of all ages to safely walk and bike on the entire length of Greenbag Road so people can safely access the schools, parks, and shopping areas along that stretch of road on foot or by bike.
789	I strongly use you to have a bike and pedestrian friendly walkway all the length of Greenbag Road from Sabraton to 119 so that families and workers can safely bike along this roadway to get to work and to access White Park and all the recreational opportunities there. Right now, it is very unsafe to walk or bike on this road. This would make Morgantown and much more bike/walk friendly community. It would also connect the rail trail in sabraton to the rail trail on Monongalia blvd. This so important to the health and happiness of our community and provide an alternative mode of transportation for our workers. This will make Morgantown a much safer biking and walking community and will pay off exponentially in terms of health, happiness and productivity.
790	Another option needs to be taken into consideration as the leading alternative for the roundabout at the Kingwood Pike and Greenbag Road intersection. Neither the State DOH, nor MMMPO seem to want to acknowledge the correct solution to current and future traffic flow in that area. Whether it's a lack of due diligence, or political pressure from the City of Morgantown to alternate truck traffic, is unclear. Left turning lanes ONLY on Greenbag, with arrows allowing protected turns onto Dorsey Avenue and Kingwood Pike would be highly efficient. Dorsey and Kingwood Pike do not need added lanes to address traffic flow, which in turn reduce construction costs, reduce property acquisition costs, and do not displace any residences. Traffic congestion peaks during school dismissal and the typical 5 o'clock rush, but otherwise flows efficiently(what parts of town don't have the same peak use, yet operate sufficiently without a roundabout)?! Wasting time and money on the roundabout will not alleviate traffic patterns through downtown; its simply the shortest, easiest route for trucks. The Greenbag corridor is quite developed already, and to say that the roundabout is necessary to accommodate future traffic levels(that couldn't be remedied by turning lanes), is a false representation.
791	I encourage sidewalks and bike lane along Greenbag Road so that people can safely access the schools, parks, trails, and stores along that stretch of road on foot or by bike.
792	never should’ve put a light in without a turning lane to begin with!
793	We don't need another freaking roundabout.
794	Why not just go back to a four way stop. Like a few years or so back. Those work fine. Nope round about are the answers to everything in Morgantown. I remember it for many many years.band my dad was great friends with Dewey. Prayers that don’t do this to the farm
795	We definitely don't need another round about
796	Good Lord, we're back to this again? I was at all of the council meetings during the last go round. It's unnecessary... but so was closing off the connector road in Sabraton but here we are.
797	Instead of putting a roundabout at the bottom of the pike they need to do major work on the pike itself to the overpass. It's atrocious!

798	The roundabout is worthless, case in point look at the mileground. No one knows how to use it, and unless you are going to teach every single person in town how to use it it will do absolutely no good! Having a small community farm there is wonderful. I tell my children about it every single time we pass. We see them working and vegetables growing and it is just a very positive thing in a negative world. It is very sad. You could use that money to fix the roads around our town. Also, diverting traffic across Aaron's Creek Road is ridiculous. That road has horrible traffic as it is. It is a single lane road that never gets plowed and people slide all over it on a good day. I cannot imagine upping the traffic more in that area! You are looking to make it absolutely miserable for every single person who lives on that road or that has to travel across it. Please reconsider waiting both your time and money on this horrible idea.
799	How many people that are encouraging roundabouts have driven tractor trailers for a living? Cars can maneuver really easy in roundabouts, it's a different story for larger vehicles
800	I travel Greenbag Road routinely as I live in a neighborhood near this road. I feel strongly that the improvements to Greenbag Road could and should be an opportunity to make it safe for multiple types of users- motor vehicles, pedestrians and cyclists. I hope that the DOH takes all users into account when making these decisions. There are residential neighborhoods, schools, parks, and a grocery store on this road that need to be considered as destinations. I witness walkers and cyclists routinely trying to navigate on the sides of Greenbag Road, a currently dangerous situation. Along Greenbag Road there is a great need for pedestrian / bike infrastructure. The safest option for this is a 10-12ft multi-use path. The path, separated from traffic, would be located on the north side of Greenbag Road the length of this project which would result in a safe route to hundreds of residents in neighborhoods and housing developments and connect schools and city parks. Instead of filling in missing sidewalk, a separated multi-use path would be cheaper, safer, and would accommodate many types of users. It would not only be safer, it would feel safer, and thus would get more use. There needs to be a designated, safe crossing of Greenbag Rd. to serve residents from low-income neighborhoods who travel on foot and by bicycle to reach the grocery store. Such a crossing will also serve the community by facilitating the connection of two key recreational areas—White Park and Dorsey's Knob Park. Adding a pedestrian signal at the current signalized intersection of Greenbag Rd and Mountaineer Mall would seem to be the most logical location for a pedestrian crossing. If the project cannot be extended to the current signalized intersection, adding a HAWK beacon (High-Intensity Activated crosswalk) at the current western terminus of the project would serve a similar purpose. I have no issue with the planned roundabout though I prefer a design with the least impact to the community garden. I support roundabouts in general as they reduce air pollution since cars don't sit at a light idling, slow traffic down, and reduce the likelihood of T-bone car crashes. I would also like to see a sidewalk on Lucky Lane. Thank you for the opportunity to comment on this project. This need is also well-documented in the MMMPO bike /ped plan that also had public input. I hope you listen to the needs of the community as a whole and provide a safe option for pedestrians and cyclists

801	A huge roundabout in this location seems absolutely ridiculous to me especially at that high cost. The traffic didn't previously back up often when there was a four-way stop except at a few very precise times each day. The previous actual four-way stop that was there was one of the best clearest four way stops in the state. Adding the light did not fix the problem; It exacerbated the problem. Now at any random time of day you may have to sit waiting for the little bit of traffic that prevents a left turn. Out side of that , It's still backed up at certain times of day because there's no left turn lane.If a left turn lane is added we can go back to almost as good as it was with a four way stop. A roundabout is ludicrous. Who has their thinking cap on regarding this project?
802	1. Having a sidewalk all along the north side of Greenbag is a good plan for pedestrians. However, a multi-use path would be safer and more convenient for both pedestrians and bicyclists. 2. Sidewalk as proposed on east side of Dorsey, connecting Greenbag to Luckey Lane and Mountainview Elementary, looks good. 3. Sidewalk on Luckey Lane is good, but better would be to extend it the entire length of Luckey Lane. 4 Roundabouts are good as proposed. 5. Lack of pedestrian and bike infrastructure from Dorsey intersection to the east? Should have a five foot sidewalk on north side of Greenbag with paved shoulders or bike lanes on both sides. Better yet, a 10-12 foot multiuse path on the north side of Greenbag from the Dorsey intersection to the eastern end of the project. If putting infrastructure in the Luckey Lane to Dorsey Ave section is not feasible, install a sidewalk or multiuse path from the Luckey Lane-Greenbag intersection to the eastern end of the project. 6. Paved shoulders and sidewalk from the Dorsey intersection to the west won't be enough for bicyclists because of the traffic speed and volume. Alternative to consider: 10-12 foot multi-use path, separated from the road. 7. Need a safe pedestrian crossing from the western end of the sidewalk on the north side of Greenbag near the Goodyear Auto building to the south side of Greenbag. A pedestrian hybrid beacon would be helpful. 8. In general, we need safe walking and biking space in this area that protects pedestrians and bicyclists from vehicle traffic, and we need as much width as possible to be sure pedestrians and bicyclists are safe as they share the infrastructure. Thank you very much for the opportunity to offer comments on this important project.
803	No roundabout is necessary. If anything, the addition of a turning lane would suffice. I can't imagine the delays the construction of this alone will cause for people living on the Kingwood Pike and Preston county. Also, taking away the farm at the bottom of the Pike would likely just add to more food insecurity that this state already faces. There is no real need for this roundabout. Invest the money in the existing crumbling infrastructure. Or, perhaps create an interstate exit onto the Kingwood Pike. That would make travel to and from the Kingwood Pike and Preston county much more convenient, and therefore, clear up traffic on the Greenbag Road. A win, win really.

804	Dear R.J. Sites and all Interested Parties concerning: FEDERAL PROJECT # STP-0857(019)D / STATE PROJECT # U331-857-0.67 / (GREENBAG ROAD IMPROVEMENT PROJECT) I am a Concerned Party regarding this project, as I farm garlic within the boundaries of disturbance of Option F. This project will cause irreplaceable to damage. I have farmed garlic for over 8 years in this location. The labor materials and time I have dedicate to farming garlic is significant. I reserve the right to seek damages for time/labor/materials, current distress and duress, and future damages and/or remedy if this project continues as planned, rendering me unable to farm garlic in this location.
805	In the spirit of the purpose of NEPA to "encourage productive and enjoyable harmony between man and his environment," I am writing, at the earliest opportunity, to inform the Federal Highways Administration and West Virginia Department of Transportation of my business located within the area of disturbance of the proposed Greenbag Road Improvement Project. Please accept these comments and this evidence as part of the formal federal process of NEPA and the period allowing for official public comment. In addition to providing this information to the agencies (federal and state) as comment, I am also providing you this information to be considered as newly discovered information given that the information provided in this letter is providing evidence to correct flaws in the existing condition as described by the project in the Environmental Assessment (EA). Joy And Hemp Universal LLC, a woman-owned small business, a WVDA licensed hemp farm, and regional agriculture resource, is located at the southwestern corner of the intersection of Dorsey Ave and Kingwood Pike, Parcel ID: 31-09-048A-0011-0000, 09-48A-001000000000, and 08 10005400100000. The acreage is 2.7810 AC, 1.752 AC, 2.295 AC, respectively. The entire acreage, 6.828 acres, of our farmland would be impacted directly and indirectly by the preferred alternative for the intersection design, "Option F", resulting in irreversible and irretrievable commitment of resources which equates to a loss of natural resources, loss of historical and cultural resources, loss of prime farmland, loss of economic revenue, and loss of my property which would be taken from me involuntary. The EA is intended to provide opportunity to describe and evaluate the impacts to social, cultural, natural, economic, and environmental resource factors. In our case, it has done none of the above because the EA failed to identify the property as agricultural land with prime farmland (farm land of statewide importance), the economic value that this land generates through agricultural production, the loss of historical and cultural value which is known by the landowner (myself) but not properly surveyed, impacts to hydrologic and watershed effects to receiving streams from disturbance, effects on the local food system including loss existing food sources, and displacement of a woman-owned small business. The EA incorrectly assesses the classification of land use and lacks the proper designation for the soil resource as prime farmland (farmland of statewide importance) where our business, Joy And Hemp Universal LLC is located The EA is does not properly identify the soil map unit where the property is located at as soil of statewide importance for farmland. The Clarksburg soil series is known to be a productive agricultural soil. The soil and land are utilized by Joy And Hemp for agricultural crop production. The EA should be corrected regarding the classification of land use and designation for this property.

	Table 7 refers to the NRCS Form CPA-106. If this form was utilized to categorize the property as nonproductive farmland, then this assessment is in question because it was not done in cooperation with the landowner or with the knowledge that current prosperous agricultural production is being conducted as the present-day land use. Continued...
806	Continued from #805 The West Virginia Department of Agriculture acknowledges as such through an active permit for hemp cultivation on this property. Completed forms for assessed properties are not included in the EA or referenced as part of the project record in any manner to show where they were applied and to which landowner. The EA must adequately display where this assessment was conducted so as to be able to show, as part of the analysis, which farmland was not deemed productive—just as the EA shows which farmland is productive by identifying the prime farmland not only in maps but also in the effects and in the comparison of alternatives. This full disclosure of the site-specific nature of the assessment would then be a transparent analysis and equally treat all landowners with regard to assessed land use for agricultural purposes. Nowhere in this EA does it disclose which segments of land underwent the process of evaluation using the NRCS Form CPA- 106 or who conducted this analysis. Disregard for the correct land use and soil information regarding this property in the EA (and corresponding tables and descriptions) has resulted in omissions for direct, indirect, and cumulative effects for prime farmland, disturbance acreage, water quality, heritage and cultural resources. We assert that inadequate data was made available to government agencies by the hired contractor identified in the EA for decision-making. The EA must be corrected to include the economic, socio-economical, environmental, and farmland impacts due to the loss of the productive agriculture business and loss of soil of Statewide Importance if the preferred alternative were to be selected. This same information and analysis should also be done for all alternatives to provide an accurate comparison of alternatives and the tradeoff for each alternative considered and analyzed in detail. Due to COVID-19 and the restriction and limitations (as direction provided by the U.S. Government through the CDC and the State of West Virginia through the Health Department) this pandemic has brought upon the country, changes in daily operations of all businesses across the country, the 2020 federal election, and other pressing matters during this public comment period; National, State, and local environmentalist groups, farming organizations, food security advocacy organizations, and conservation agencies are just becoming aware of the impacts of the proposed alternative and the marauding of Federal and State Transportation Agencies. Therefore, as with many activities across the country, an extension of the comment period and opportunity to provide new information and findings by the public must be granted to allow for participation in a safe manner. Within the alternatives, the Government should be prepared to identify the economic effects from the loss of farming income and other effects

	by a conversion of prime farmland. The analysis must also identify mitigations for both the loss of the prime farmland (farmland of statewide importance) and losses and damages incurred to our business, current economic revenue and projected revenue based on the business plan and future operations. Since beginning farming in 2018, Joy And Hemp Universal LLC has made substantial investment into start up at property located at the intersection of Dorsey Ave and Kingwood Pike, Parcel ID: 31-09-048A-0011-0000, 09-48A-001000000000, and 08 10005400100000. This would need to reconciled. We are prepared to provide evidence of this investment and help the EA correctly identify those direct losses from each analyzed alternative. Given the sensitivity of personal financial information and proprietary claims for the value of the losses, we will not be providing this information as part of this letter but rather through a formal submission of confidential information to the agencies. Continued...
807	I have been watching the planning for the entire Greenbag Road project. I strongly encourage the WVDOH to incorporate all forms of transportation that will result in a corridor that encourages people of all ages, abilities, economic levels, and is inclusive to our whole community. In order to do this, the corridor needs to have safe places for people to walk, bike, utilize disability modes of transportation, and other methods because this corridor connects key schools, parks, shopping areas, and business in our town. Providing the opportunity for people to use alternative forms of transportation allows them the freedom to choose to keep our communities healthier, reduce impacts on roadways and air quality, which provides long-term and forward-thinking financial benefits to our WVDOH and funding. Providing better alternative transportation options also benefits communities through the attraction of younger and active professionals, which has been shown to be key factors in attracting businesses. Thanks for your time!
808	I encourage DOH to build a place for people of all ages to safely walk and bike on the entire length of Greenbag Road so people can safely access the schools, parks, and shopping areas along that stretch of road on foot or by bike. As an avid bicycle commuter, I would appreciate the addition of a bicycle lane to ensure my safety and the safety of those around me as a travel to and from my destinations. Thank you
809	Continued from #806 No surrounding areas within the 6.828 acres affected would remain farmable for hemp cultivation due to the photo responsive nature of the hemp flower. The crop would be affected by light pollution from the artificial lighting needed in the preferred alternative. The plants are extremely valuable in today's market compared to other commodity crops, and substantial losses to our business would be incurred with the implementation of the preferred alternative. Further, our business may incur unforeseen losses due to this intersection design. Part of Joy And Hemp Universal LLC's mission is to help other farmers in West Virginia. As a result of the construction of the preferred alternative, the educational programs that occur on this location would be destroyed. Those programs are supported by a number of local hemp farms, and other farmers, and WVU research students. This social impact was not identified in the EA and the loss was not accounted for in the effects analysis. Loss of this space for such programs would cause damage to our business and others and must be remedied or mitigated if the project were to continue as described by the EA.

	I am available should you have questions. Thank you!
810	1. INTRODUCTION In August 2020, the West Virginia Department of Transportation released an environmental assessment (EA) for proposed improvements to Greenbag Road located just outside the city limits of Morgantown in Monongalia County, West Virginia. The EA was prepared by the West Virginia Division of Highways (WVDOH) in cooperation with the Federal Highway Administration (FHWA) to assess impacts from proposed changes to reduce congestion and improve non-motorized connections. Traffic studies cited by WVDOH find that major intersections are impacting the flow of traffic on Greenbag Road and that expected growth in the region will lead to continued deterioration to unacceptable levels. The EA describes options for improving traffic flow, referred to as "alternatives" in the report. Alternatives include two options for road widening, which include different lengths of new turning lanes on Greenbag Road, as well as turning lanes on Dorsey Avenue and Kingwood Pike. The EA also presents three options for configuring the two main intersections in the project area, including turning lanes in all directions and roundabouts at each intersection. In total, six new configurations were reviewed along with an alternative where no construction would be undertaken. The EA references previous planning work done by the Morgantown Monongalia Metropolitan Planning Organization. Improved safety and increase access for pedestrians was listed as a community concern identified through this planning process. (WVDOH, 2020) Downstream Strategies, LLC and Ltt Soil, LLC were engaged by owners of property slated to be impacted by the development of a roundabout at the intersection of Greenbag Road, Dorsey Avenue, and Kingwood Pike. In this report, we evaluate whether the EA appropriately considers: · the identification and loss of prime farmland (farmland of statewide importance), · stream and wetland impacts, and · all reasonable alternatives. (continued)
811	Continued from #810 2. LOSS OF PRIME FARMLAND (FARMLAND OF STATEWIDE IMPORTANCE) The following comments refer to the Mary E. Hastings Property, Parcel ID: 31-09-048A-0011-0000, located at the southwestern corner of the intersection of Greenbag Road and Kingwood Pike (the "Hastings property"). The property in question is within the limits of disturbance. The EA incorrectly leaves this property out of its assessment of prime farmland. While not acknowledged in 1 the EA,this property's soils actually classified as a soil of statewide importance for farmland. The Clarksburg soil series is known to be a productive agricultural soil, and the soil and land are utilized by Mary Hastings and others for agricultural crop production. The EA should be corrected regarding the classification of land use and designation for the Hastings property in the EA by: 1. Correcting all maps showing agricultural land for the Hastings property. 2. Correcting the analysis and calculations for the disturbance of the prime farmland (farmland of statewide importance) impacted by all alternatives for the Hastings property.

	3. Updating the following tables by accounting for the disturbance to the agricultural land on the Hastings property: Table E-2: Summary of Impacts from the Preferred Alternative (2 / C / F); Table 5: Summarizing the Effects Analysis from Alternative 1 and Alternative 2; Table 5: Impacts Analysis Table – Alternatives; Table 6: Impacts Analysis Table – Mississippi Street Intersection Options; Table 7: Impacts Analysis Table – Dorsey Avenue / Kingwood Pike Intersection Options; and Table 11: Summary of Impacts from the Preferred Alternative (2 / C / F). 4. Analyzing and identifying the socioeconomic effect from the loss of farming income from the effects of each alternative by a conversion of land use for the Hastings property. 5. Identifying the mitigation for both the loss of the prime farmland (farmland of statewide importance) and the loss of income from not being able to utilize this land for income as part of any decision for a preferred alternative. Table 7 refers to the NRCS Form CPA-106. If this form was utilized to categorize the Hastings property as nonproductive farmland, then this assessment is in question because it was not done in cooperation with the landowner or with the knowledge that current prosperous agricultural production is being conducted as the present-day land use. The West Virginia Department of Agriculture acknowledges as such through an active permit for hemp cultivation on this property. Completed forms for assessed properties are not included in the EA or referenced as part of the project record in any manner to show where they were applied and to which landowner. The EA must adequately display where this assessment was conducted so as to be able to show, as part of the analysis, which farmland was not deemed productive—just as the EA shows which farmland is productive by identifying the prime farmland not only in maps but also in the effects and in the comparison of alternatives. This full disclosure of the site-specific nature of the assessment would then be a transparent analysis and equally treat all landowners with regard to assessed land use for agricultural purposes. Nowhere in this EA does it disclose which segments of land underwent the process of evaluation using the NRCS Form CPA- 106 or who conducted this analysis. In addition to hemp cultivation, the Hastings property is also the site of Conscious Harvest Cooperative's flagship community garden—a space where community members can rent small or large garden plots to produce their own food. The Cooperative also supports an income-based, subsidized community-supported agriculture (CSA) program to connect individuals and families in need with local, healthy produce. Partner organizations join the cooperative to access healthy food vouchers for their staff and clients. This CSA program connects local farms and community agencies. (continued)
812	Please do not do this roundabout at the end of Kingwood Pike. Turning lanes would be the best solution. When the Pike is icy in winter it is going to cause major accidents, people will be sliding Into the roundabout. It is also taking precious land from businesses. Please consider this. Thank you
813	Continued from #811 Shareholders are then provided with CSA shares at an affordable, subsidized price that is dependent on income. In 2020, the group invested $9,555 back into the local food economy, purchased $6,480 worth of produce for local families, and provided approximately 2,000 pounds of

	produce to West Virginia families. The area used by Conscious Harvest Cooperative on the Hastings property is almost completely within the limits of disturbance of the preferred alternative. The value of this agricultural resource would be lost if the project moves forward as currently planned. The use of the land for the CSA provides additional support that this soil (CkC map unit – Clarksburg soil series) is currently being used for agricultural food production and indeed warrants classification of prime farmland (farmland of statewide importance) and the protection that goes along with this classification. 3. STREAM IMPACTS Construction will occur in the Aarons Creek and Cobun Creek watersheds. If the preferred alternative is chosen, there will be permanent impacts to these creeks—as well as streams within the proposed limits of disturbance. Road widening will likely force the relocation of streams, destroying existing habitat and severely disrupting aquatic organism populations and potentially species diversity. Road widening and construction of the roundabout will also increase the culverted length of streams in the project area. This will lead to the permanent loss of habitat for the length of the culverts. Depending on culvert length and design, the ability of aquatic organisms to pass up- and downstream of the project area will be limited or completely blocked. This will contribute to loss of upstream refugia from warming waters due to downstream runoff from further urban development, decline in potential spawning habitat in secondary tributaries, and potentially increased exposure to environmental contaminant runoff from roadways and urban settings in times of flooding and other storm events. Table 11 of the EA lists the lengths of streams impacted by the preferred alternative, but the types of impacts (complete loss, level of habitat degradation, change in streambank and stream substrate composition) are not described. The current condition of these waterways was assessed in the Wetland and Surface Water Delineation Report, included in the EA as Appendix B, but the EA did not include any predictions or describe the effects of the condition of these streams after construction. Without this information, is it impossible to determine the impacts to streams in the project area. Table 13 of the EA summarizes mitigation commitments for the preferred alternative. For impacted streams, construction and stormwater control best management practices are discussed, but no mention is made of mitigating for permanent loss of aquatic habitat or reduction in the quality of remaining habitat. Calculations should be made for the actual loss of stream and the riparian area impact, and these calculations should be accounted for in the analysis of each alternative. Road widening and construction of roundabouts with truck aprons will increase the area of impervious surfaces throughout the length of the project area. This, in turn, will increase the amount of stormwater runoff, as acknowledged on page 10 of the EA. Streams form in response to the amount of water that normally flows through them during storm events. Regularly increasing the volume of water to streams during storm events will cause changes to the shape and size of receiving streams, often leading to rapid erosion, destabilization of streambanks, and sediment deposition in aquatic habitats. The water quality will also be impacted due to changes in stream temperatures and changes in chemistry from pollutants in the surface runoff from the paved surfaces. These changes will impact both the quantity and quality of the water in streams downstream of the project area. (continued)
814	Continued from #813 For example, the stream running east from Jonathan Lane along Greenbag Road discharges into Aarons Creek at the eastern end of the project area. The EA notes that this stream will be expanded to accommodate increased runoff. This increased runoff will discharge into Aarons

	Creek. No mention is made of the possible impacts of this discharge on the stability of Aarons Creek—a stream which, according to Friends of Deckers Creek's multi-year watershed-wide monitoring program, is one of the cleanest and healthiest in the watershed. The EA must also include a stream assessment of Aarons Creek and a full indirect effects analysis done for each alternative to this stream system to assess stream stability, sediment and erosion, and aquatic habitat integrity. In summary, the EA does not adequately quantify or mitigate for impacts to Aarons Creek or Cobun Creek, streams outside the area of disturbance for the preferred alternative that will be impacted. 4. WETLAND IMPACTS 4.1 Interpretation of soil survey data In addition to the errors noted above regarding prime farmland designation, the EA also misrepresents the soil series mapped on the Hastings property in the Wetland and Surface Water Delineation Report, included in the EA as Appendix B. On page 239 of the PDF document for the EA, Table 1 identifies the Clarksburg soil series4 as a hydric soil as designated by the U.S. Department of Agriculture Natural Resource Conservation Service. This is incorrect. The Clarksburg soil series is moderately well drained and is also identified as farmland of statewide importance. Designation as both hydric soil and farmland of statewide importance are in direct conflict. The Web Soil Survey does not designate this soil series as hydric. This is an error in the analysis. This same error is also made for the Monongahela soil series. This error in the EA calls into question the validity and interpretation of the way in which the soil survey data is being used in this EA and the accuracy of the analysis. It seems that there is a lack of understanding about the design of soil map units and the minor soils that may be present within a map unit. Within the Clarksburg soil map unit, the Melvin soil series is identified as a minor soil component, and it is classified as hydric. Because this is not adequately explained or appropriately represented in the EA, the analysis is flawed and calls into question the wetland delineation analysis and soil determination. No transects or soils assessments were conducted on the Hastings property as displayed in the map for the Aquatic Resources Report. 4.2 Increased stormwater runoff Wetlands adjacent to the limits of disturbance will be impacted by increased stormwater runoff. Wetland 6 is described in the Wetland and Surface Water Delineation Report as an 80 percent forested wetland providing important wetland functions including sediment retention, nutrient removal, and groundwater recharge. This wetland is adjacent the proposed site of the Mississippi Street roundabout in the preferred alternative and, although it is currently shown as outside the area of disturbance, it is likely to see increased runoff from the widened road and possibly from the roundabout. Increased stormwater runoff could increase water levels and sediment and pollutant deposition, which may affect the hydrologic conditions of the wetland and cause a change in vegetation and function from its current state and ecological value. Wetlands 1 and 7 identified in the Wetland and Surface Water Delineation Report include forested and emergent wetland areas, which provide significant ecological services to the surrounding areas including groundwater recharge, sediment and stabilization, and nutrient removal. They are shown to be outside the area of disturbance for the preferred alternative; however, these wetlands receive runoff from three streams that will be impacted by construction. (continued)

815	I understand the increasing need for road construction and infrastructure, but I also believe with reasonable arguement that it could be implemented in a more sustainable manner with no affect to the surrounding active farmland. This proposed roundabout creates conflict between local government officials who are understandably trying to expand urban growth and landowners who are trying to preserve their cherished crops. Taking away from them with no where near the compensated amount to cover their net worth of goods is pure evil. I believe there are plenty of ways to compromise so both parties could benefit, the road may be built for better traffic flow and the landowners could keep their property as deemed to them.
816	Continued from #814 As discussed above, the EA does not clearly define these impacts, so it is difficult to know exactly what changes will occur. At a minimum, these wetlands will see increased runoff from the increased impervious surfaces nearby. Increased sediment and pollution levels are also possible, both during construction and afterwards. Wetlands 1 and 7 could also receive increased stormwater and pollutants directed from the increased impervious surfaces created by the widened road and roundabout. At a minimum these increases should be deemed as an adverse effect because they negatively change the ecological value and services that the wetlands perform within the watershed. These changes to wetland hydrologic conditions, increased deposition of sediment and pollution, and resulting stress on existing vegetation will negatively impact the valuable functions provided by wetlands just outside the area of disturbance defined in the EA. This would add to a cumulative effect of decreasing overall watershed health. These are not adequately quantified in the EA and no mitigation of these impacts considered. 5. REASONABLE ALTERNATIVES The EA considers three alternatives for the intersection of Greenbag Road with Dorsey Avenue and Kingwood Pike: Options D, E, and F. Another option should be analyzed and included in a revised EA that combines dedicated left turn lanes for Greenbag Road (as in Option D) with the design features, but no added lanes, for Dorsey Avenue and Kingwood Pike described in the Executive Summary of the EA. These design features include widening traffic lanes, adding sidewalks on Dorsey Avenue, and adding a paved shoulder on Kingwood Pike. This new option would have numerous benefits. It would: + improve the safety and access for motorized and non-motorized connections; + reduce impacts to natural resources; + preserve significantly more of the adjacent farmland of statewide importance; + reduce the amount of impervious surface, causing fewer impacts to nearby streams and wetlands; + limit impacts to existing residences and businesses on Dorsey Avenue and Kingwood Pike and account for additional historic and cultural preservation; and + reduce construction costs. 6. RECOMMENDATIONS We recommend that WVDOH and FHWA issue a revised EA that addresses the concerns raised in this report: - Correct errors regarding the classification of land use and designation for the Hastings property, including updating all maps and tables that reference prime farmland (farmland of statewide importance), analyzing and identifying the socio-economic effect from the loss of farming

	income, and identifying the mitigation for both the loss of the prime farmland (farmland of statewide importance) and the loss of income. - Provide information on the post-construction conditions of streams in the project area to accurately quantify steam impacts and stream mitigation requirements. - Quantify and mitigate for impacts from increased stormwater discharge to Aarons Creek and Cobun Creek, which will be impacted even though they are outside the area of disturbance. · Revise the wetland delineation report to accurately describe soil types and expand field surveys to ensure that all wetland (hydric) soils are reviewed in the EA. - Quantify the impacts on wetlands adjacent to the project's limits of disturbance from changes to wetland hydrologic conditions, increased deposition of sediment and pollution, and resulting stress on existing vegetation. - Include and analyze a new option with dedicated left turn lanes for the Greenbag Road approaches and design features, but no added lanes, for Dorsey Avenue and Kingwood Pike. In addition, the EA includes multiple Appendix A's as well as Table 1's, making tracking in this document difficult and the references to each item possibly incorrect. In Table 5 under the description for impacts to floodplains, there is a reference to Table 2, but Table 2 deals with impacts to environmental justice concerns.
817	This is my 3rd comment Public safety is Primary concern. Lack of. Consideration for public Safety show in your. In your plan. Is not acceptable. The lack of Concern for people safety i HAS Not Addressed. Properly. I reviewed the plan. The proposed. Design for foot traffic is Ludicrous. I mention last year. That a life is more valuable than your profit margin. Among other safety concerns. 1. You have failed to address the Mountainview primary school. Currently mothers are dodging traffic to transverses a 4 foot culvert With child in hand .. 2.Lighting sidewalks. 3.Crosswalks guard rails are not addressed properly. Do you really feel that this proposal will fit the public needs both in cars and walking? Does the State of West Virginia put automobiles ahead of peoples safety and well being ? The first fatality should be considered on your head. And i certainly hope and pray this comment will be available to the attorneys involved. Furthermore, there's no consideration, 0, zero, None for any foot traffic from the kingwood pike crossing 857. North or south There. Are no proposed crosswalks. "Pedestrians have been Thrown under the bus" I among others will no longer. Be able walk to church. Which is less than one thousand Yards from my home. God. is watching
818	Please consider a safe bicycle lane for this project. This would allow access from White Park to Sabraton enabling more connectivity for the community.
819	Noooooooooo

820	I wonder if any of the powers that be have ever seen how roundabouts are used on the West Coast. I'm NO expert, but I never saw one at a major intersection of 2 major roads living there. Let alone one that is part of a schools entrance/exit. They were located on larger, yet moderately-traveled suburban neighborhood roads. It seems the complete opposite here and very dangerous for the amount of traffic on them
821	I first visited the beautiful farm in the proposed location for the roundabout in fall of 2020. I tasted the plums and tomatoes grown on the property by the family, and they were second to none. Using imminent domain to take a multi-generational family farm and active cbd business is a moral crime. Small parcel land owners, farmers, and small businesses should be protected, not trampled upon. Especially when their existence seeks to improve and benefit those around them.
822	Against proposed roundabout. Right turning lane instead.
823	This my fourth comment For the record im totally disabled.from a sub dural. Hematoma. Last april 16. At your program I spent 2 hours with DOH. Spoke person chad. Lowther. Why..You have not addressed my comments in your Report You must be a gambling man. You gambling 10. Million of taxpayer funds that the retaining wall will allow east bound traffic flow. I bet not This wall as i. ,Have Stated,. has been replaced 3 times since the construction. Of route. 857. . 1963 app it 2020 60 years 4 walls do the math Yet no consideration in your. Newly dated plans... i would say new plans However there are the same as last years I brought in a wv landslide map.remember. oh no you dont YOU SIR mr.Sykes didnt have 30 seconds for me You could wait to go home..you remember. Mr Lowther does. Again prudence requires. Hire a 3rd party geographic engineer. BE HIRED that understands what a lateral lines Represent and the relationship of proximity of these markings. Just as requested 16 april 2019. Over a year ago. YOU CLEARLY DO NOT KNOW HOW TO READ A LANDSLIDE MAP It wont just go away. Its clear you do not... Nor have my questions would been addressed from last year. History is a great teacher for those. Who take the time to review it. As you are aware of mr.Richards Comments and landslides Perhaps history will show That DOH had to make addition. Monetary compensation after the construction 857 to mr richards grandfather for loss of ability to operate his farm ..as well loss of his barn as it slid over the hill towards your cut. Another "gamble" .your willingly taken. with. My " public" taxpayer dollars. Look at history sirs The taxpayer demands that you not piss away our tax dollars. While counting your profit.
824	I encourage DOH to build a place for people of all ages to safely walk and bike on the entire length of Greenbag Road.
825	The Environment Assessment states there is expected increase growth and development in the region. Why was the increase in traffic, noise, and air pollution associated with growth and development not described, considered, or analyzed as impacts in the Environmental Assessment?
826	Please, Please, Please DOH, build a place for people of all ages to safely walk and bike on the entire length of Greenbag Road so people can safely access the schools, parks, and shopping areas along that stretch of road on foot or by bike.
827	I'm a long time cyclist in morgantown and I routinely use my bicycle to transport my 5 year old daughter. my daughter's kindergarten is on greenbag road, but I am afraid to bike her there! Greenbag road has no shoulders or sidewalks and has frighteningly fast auto traffic. I would be

	able to visit businesses on greenbag with better infrastructure. At the present time, I do not visit those businesses because of the unfriendly infrastructure.
828	Bad idea for everyone need to fix the roads around it first before some one gets killed Aaron's creek isn't fit to drive on
829	Your proposed drainage plans for the Greenbag Rd project is not adequate....What are you attempting To do? FLood The CHURCH?
830	your ADA REPRESENTIVE is Aloof
831	I'd like to urge WVDOH to reject the plan to add roundabouts on the Greenbag Rd for the following reasons: (1) The plan to move truck traffic from downtown Morgantown to the Greenbag Rd is an outdated plan which will only result in degregation of this road, causing the need for addition highway funds to maintain it. Trucks should be required to use the Interstate instead. (2) With the Middle school nearby and recent increase in residential development in the area, the Greenbag-Dorsey intersection is now frequented by school buses and more parents transporting students. The addition of a roundabout, which encourages faster travel, creates a significant safety hazard for children and families. This would be even worse if truck traffic is being directed to this road. (3) There are several other roads within Morgantown where traffic is a much more significant issue that are in greater need of attention, e.g. Vanvoris Rd, University Ave, Beechurst, are much higher priorities, to name a few. (4) In general, roundabouts still confuse drivers. If upgrades to Greenbag Rd are made at all, turning lanes are a simpler, safer and likely less expensive alternative to adding roundabouts at Dorsey-Greenbag and Dorsey-Mississippi Aves. (5) Lastly, the cost and negative community reaction associated with acquiring land needed to build unwanted roundabouts is a taxpayer burden and insights local/neighborhood outrage. This is esp. true with land of historical significance and community service such as the Hastings farm provides. In summary, in a time where demand for organic farming and buying local are of increasing community interest, historical land preservation would be compromised, the safety of area children and families are at risk, and much better alternatives are on the table, it seems irresponsible for the state to spend significant tax payer money to build the unsafe and undesirable roundabouts being suggested for the Greenbag Rd. Thank you for considering these arguments and I am hopeful the the WVDOH will make the best decision for the residents of Morgantown and area taxpayers on this matter.
832	I appreciate and applaud everyone's hard work balancing the many interests on this project. It is a very important one for the future of the Morgantown region! As noted in the main page for this project: "Community involvement in the development of the Morgantown Monongalia Planning Association (MMMPO) Greenbag Road Corridor Study (2015) identified pedestrian facilities to connect the neighborhood schools with the commercial and residential areas as a key issue for community safety and access." While I applaud the DOH's work to include pedestrian infrastructure and some bike accommodations on the western half of the project, to not connect hundreds of residents and multiple businesses on the east side of Mountainview is contrary to that statement, and I hope the DOH will strongly reconsider the design from the Dorsey intersection eastward. I'd like to respectfully submit these points for consideration in the design: 1) sidewalk the entire length of the project on the north side of Greenbag is a good option for pedestrians, though a multi-use path would be much safer and encouraging for the average pedestrian or bicyclist 2) I fully support the sidewalk as designed on the east side of Dorsey, connecting Greenbag to Luckey Lane and Mountainview ES 3) I fully support the sidewalk on Luckey Lane, but would like it to extend the entire length of Luckey Lane 4) I fully support the roundabouts as designed. I hate to see the loss of land for the community farm but understand why that is the chosen alternative

	5) <<From Dorsey intersection to the east>>: the lack of ped/bike infrastructure on this section of the project is a major concern and contrary to public feedback as noted above. Thus, I strongly recommend (a) a 5' sidewalk on the north side of Greenbag + paved shoulders or bike lanes on both sides, or (b) preferably, a 10-12' multiuse path on the north side of Greenbag from the Dorsey intersection to the eastern terminus of the project to connect the schools to hundreds of residents in the housing developments that are accessed from Jonathon Lane, Ashworth Lane, and Long Branch Drive. ---Alternatively, if the Luckey Lane to Dorsey Ave section is absolutely impossible for ped/bike infrastructure along Greenbag, at a minimum a sidewalk or multiuse path is requested from the Luckey Lane intersection w/Greenbag to the eastern terminus of the project 6) <<From Dorsey intersection to the west>>: I appreciate the bicycle accommodations (3-4' shoulders), but those will be very uncomfortable for the average bicycle rider because of the proximity to high speed and volume of traffic (I've ridden that stretch with my 11 year old son, so we know). I'd ask that an alternative be considered that could support both pedestrians and bicycle riders ---> a 10-12' multi-use path, separated from the road (rather than the ~12' of paved shoulders & sidewalk that are currently proposed from the Dorsey intersection, westward) 7) <<From Dorsey intersection to the west>>: I strongly recommend a safe pedestrian crossing from the western terminus of the sidewalk on the north side of Greenbag (near the Goodyear Auto building) to the south side of Greenbag (Giant Eagle/mall) - a HAWK signal is a good recommendation. This could serve significant community interest in connecting White Park by trail to Dorsey's Knob park & trails. To summarize, pedestrians and bicyclists of all ages and skill levels should be supported along this <entire project corridor>, ideally with a 10-12' multi-use path separated from traffic on the north side of Greenbag, alternatively by using a sidewalk and two paved shoulders. I greatly appreciate the opportunity to comment on a project that will have a major impact on our area for decades. Many of us have been working for improvements throughout the entire region for pedestrians and bicyclists, and this corridor is a critical piece of the puzzle. Thank you!
833	The roundabout on the Mileground didn't improve things, same with this one
834	Attention: RJ Scites, WVDOT, US Army Corps of Engineers, and all parties involved: This notice pertains to the "Greenbag Road Improvement Project" U331-857-0.67 /STP-0857(019)D The Concerned Parties and Interested parties, as listed below, all have interest within the boundaries of disturbance and have grievances with option D, E, and F as proposed in the Environmental Assessment (EA) for this project. The Concerned Parties and Interested Parties, as listed below, wish to resolve and offerer alternatives. The Concerned Parties and Interested Parties, as listed below, formally request consideration, reconsideration, and analysis of an additional alternative option: The option preferred by ALL PARTIES, as listed below, combines dedicated left turn lanes for Greenbag Road (as in Option D) with the design features, but no added lanes for Dorsey Avenue and Kingwood Pike described in the Executive Summary of the EA.

	These design features include widening traffic lanes, adding sidewalks on Dorsey Avenue, and adding a paved shoulder on Kingwood Pike. This new option would have numerous benefits. It would: Improve the safety and access for motorized and non-motorized connections; Reduce impacts to natural resources; Preserve significantly more of the adjacent farmland of statewide importance; Reduce the amount of impervious surface, causing fewer impacts to nearby streams and wetlands; Limit disturbance to unsuitable soils with a history of slips to prevent likelihood of property damage or loss; Limit impacts to existing residences and businesses on Dorsey Avenue and Kingwood Pike and account for additional historic and cultural preservation; Reduce construction costs. The Concerned Parties and Interested Parties, as listed below, refer to this proposed option as “Option G”. The Concerned Parties and Interested Parties, as listed below, unanimously support this “Option G ‘ as “preferred” The Concerned Parties and Interested Parties, as listed below, reserve the right to challenge the EA if this project continues as proposed without additional consideration, reconsideration, and analysis for this alternative “Option G”. The Concerned Parties and Interested Parties, as listed below, reserve the right to seek damages and/or remedy if this project continues as proposed without additional consideration, reconsideration, and analysis for this alternative “Option G”. Concerned Parties: Garret Richards, Landowner at the intersection of Greenbag Road / Kingwood Pike Thomas Richards, Landowner at the intersection of Greenbag Road / Kingwood Pike Mary Hastings, Landowner at the intersection of Greenbag Road / Kingwood Pike Dewey Hastings, Landowner at the intersection of Greenbag Road / Kingwood Pike Andy Pickering, Landowner at the intersection of Dorsey Avenue / Kingwood Pike Grant Hastings, Landowner on Dorsey Avenue Twin Creek Farms, DBA - Business, intersection of Greenbag Road / Kingwood Pike Owner: Thomas Richards Conscious Harvest Cooperative, 501(c)(3) - Business, intersection of Greenbag Road / Kingwood Pike Jennifer Hastings, Secretary / Ted Hastings, Founding Member Joy and Hemp Universal, LLC - Business, intersection of Greenbag Road / Kingwood Pike Owners: Mary Hastings / Jennifer Hastings / Ted Hastings / Patrick Kyle

	Mocking Bird Hill Farm - Business, intersection of Greenbag Road / Kingwood Pike Owners: Marlin Dehoff and Neha Lala Tong Thai Fresh, LLC - Business, intersection of Greenbag Road / Kingwood Pike Owner: Shawn Komondor Christopher Lazzell - Leasee, intersection of Greenbag Road / Kingwood Pike Shawn Komondor - Leasee, intersection of Greenbag Road / Kingwood Pike Neha Lala - Leasee, intersection of Greenbag Road / Kingwood Pike Marlin Dehoff - Leasee, intersection of Greenbag Road / Kingwood Pike Brandon Zilkanich - Leasee, intersection of Greenbag Road / Kingwood Pike Richard Ryan - Leasee, intersection of Greenbag Road / Kingwood Pike Ted Hastings - Leasee, intersection of Greenbag Road / Kingwood Pike Interested Parties: Ted Hastings, Heir to land at the intersection of Greenbag Road / Kingwood Pike Jennifer Hastings, Heir to land at the intersection of Greenbag Road / Kingwood Pike Patrick Kyle, Heir to land at the intersection of Greenbag Road / Kingwood Pike
835	Attention: RJ Scites, WVDOT, US Army Corps of Engineers, and all parties involved: NOTICE: Environmental Assessment for the Greenbag Road Improvement Project I am writing, at the earliest opportunity, to inform the Federal Highways Administration, US Army Corps of Engineers, and West Virginia Department of Transportation of my business located within the area of disturbance of the proposed Greenbag Road Improvement Project. Please accept these comments and this evidence as part of the formal federal process of NEPA and the period allowing for official public comment. In addition to providing this information to the agencies (federal and state) as comment, I am also providing you this information to be considered as newly discovered information given that the information provided in this letter is providing evidence to correct flaws in the existing condition as described by the project in the Environmental Assessment (EA). Joy And Hemp Universal LLC, a woman-owned small business, a WVDA licensed hemp farm, and regional agriculture resource, is located at the southwestern corner of the intersection of Dorsey Ave and Kingwood Pike, Parcel ID: 31-09-048A-0011-0000, 09-48A-001000000000. And 08 10005400100000. The acreage is 2.7810 AC SUR, 1.752 AC SUR, 2.295 AC SUR, respectively. The entire acreage, 6.828 acres, of our farmland would be impacted directly and indirectly by the preferred alternative for the intersection design, “Option F”, resulting in irreversible and irretrievable commitment of resources which equates to a loss of natural resources, loss of historical and cultural resources, loss of prime farmland, loss of economic revenue, and loss of my property which would be taken from me involuntary. The EA is intended to provide opportunity to describe and evaluate the impacts to social, cultural, natural, economic, and environmental resource factors. In our case, it has done none of the above because the EA failed to identify the property as agricultural land with prime

	farmland (farmland of statewide importance), the economic value that this land generates through agricultural production, the loss of historical and cultural value which is known by the landowner (myself) but not properly surveyed, impacts to hydrologic and watershed effects to receiving streams from disturbance, effects on the local food system including loss existing food sources, and displacement of a woman-owned small business. The EA incorrectly assesses the classification of land use and lacks the proper designation for the soil resource as prime farmland (farmland of statewide importance) where our business, Joy And Hemp Universal LLC is located The EA is does not properly identify the soil map unit where the property is located at as soil of statewide importance for farmland. The Clarksburg soil series is known to be a productive agricultural soil. The soil and land are utilized by Joy And Hemp for agricultural crop production. The EA should be corrected regarding the classification of land use and designation for this property. Table 7 refers to the NRCS Form CPA-106. If this form was utilized to categorize the property as nonproductive farmland, then this assessment is in question because it was not done in cooperation with the landowner or with the knowledge that current prosperous agricultural production is being conducted as the present-day land use. The West Virginia Department of Agriculture acknowledges as such through an active permit for hemp cultivation on this property.
836	Continued from #835 Completed forms for assessed properties are not included in the EA or referenced as part of the project record in any manner to show where they were applied and to which landowner. The EA must adequately display where this assessment was conducted so as to be able to show, as part of the analysis, which farmland was not deemed productive—just as the EA shows which farmland is productive by identifying the prime farmland not only in maps but also in the effects and in the comparison of alternatives. This project, as currently designed, will destroy100+ years of soil production via natural amendments and labor. Our business is built on the story and integrity of our soil. The soil has been maintained for 5 generations by the same family with the same sustainable agriculture practices. This is an important branding tool for our business. No pesticides or herbicides have touched that land while our family stewarded the land. Joy and Hemp markets our products as grown by a multi-generational family, and this is a powerful branding tool. This value is passed onto our customers as rare in today's modern business world. The loss to our customers and our business. Loss of this branding tool would be significant and our business will seek damages and/or mitigation. This full disclosure of the site-specific nature of the assessment would then be a transparent analysis and equally treat all landowners with regard to assessed land use for agricultural purposes. Nowhere in this EA does it disclose which segments of land underwent the process of evaluation using the NRCS Form CPA- 106 or who conducted this analysis. Disregard for the correct land use and soil information regarding this property in the EA (and corresponding tables and descriptions) has resulted in omissions for direct, indirect, and cumulative effects for prime farmland, disturbance acreage, water quality, heritage and cultural resources. We assert that inadequate data was made available to government agencies by the hired contractor identified in the EA for decision-making. The EA must be corrected to include the economic, socio-economical, environmental, and farmland impacts due to the loss of the productive

	agriculture business and loss of soil of Statewide Importance if the preferred alternative were to be selected. This same information and analysis should also be done for all alternatives to provide an accurate comparison of alternatives and the tradeoff for each alternative considered and analyzed in detail. Due to COVID-19 and the restriction and limitations (as direction provided by the U.S. Government through the CDC and the State of West Virginia through the Health Department) this pandemic has brought upon the country, changes in daily operations of all businesses across the country, the 2020 federal election, and other pressing matters during this public comment period; National, State, and local environmentalist groups, farming organizations, food security advocacy organizations, and conservation agencies are just becoming aware of the impacts of the proposed alternative and the marauding of Federal and State Transportation Agencies. Therefore, as with many activities across the country, an extension of the comment period and opportunity to provide new information and findings by the public must be granted to allow for participation in a safe manner. Within the alternatives, the Government should be prepared to identify the economic effects from the loss of farming income and other effects by a conversion of prime farmland. The analysis must also identify mitigations for both the loss of the prime farmland (farmland of statewide importance) and losses and damages incurred to our business, current economic revenue and projected revenue based on the business plan and future operations.
837	Continued from #836 Since beginning farming in 2018, Joy And Hemp Universal LLC has made substantial investment into start up at property located at the intersection of Dorsey Ave and Kingwood Pike, Parcel ID: 31-09-048A-0011-0000, 09-48A-001000000000, and 08 10005400100000. This would need to be reconciled. We are prepared to provide evidence of this investment and help the EA correctly identify those direct losses from each analyzed alternative. Given the sensitivity of personal financial information and proprietary claims for the value of the losses, we will not be providing this information as part of this letter but rather through a formal submission of confidential information to the agencies. No surrounding areas within the 6.828 acres affected would remain farmable for hemp cultivation due to the photo responsive nature of the hemp flower. The crop would be affected by light pollution from the artificial lighting needed in the preferred alternative. The plants are extremely valuable in today's market compared to other commodity crops, and substantial losses to our business would be incurred with the implementation of the preferred alternative. Further, our business may incur unforeseen losses due to this intersection design. Part of Joy And Hemp Universal LLC's mission is to help other farmers in West Virginia. As a result of the construction of the preferred alternative, the educational programs that occur on this location would be destroyed. Those programs are supported by a number of local hemp farms, and other farmers, and WVU research students. This social impact was not identified in the EA and the loss was not accounted for in the effects analysis. Loss of this space for such programs would cause damage to our business and others and must be remedied or mitigated if the project were to continue as described by the EA.

838	We need a green turning arrow on the light. The roads aren't safe. Why would you waste 15 million dollars when the pot holes are destroying are cars. Fix the roads with the money!!!!
839	Please note that the positions outlined in this correspondence supersede the Coalition's position expressed in correspondence sent via US mail. The Greenbag Road Improvement Project offers a timely opportunity to build infrastructure that will facilitate safe travel by pedestrians and cyclists while connecting neighborhoods to city parks, schools, and local businesses. The WV DOH website public input page notes, "This Project is being undertaken to reduce traffic congestion and address the lack of safe non-motorized connections through the corridor (emphasis added)….Community involvement in the development of the Morgantown Monongalia Planning Association (MMMPO) Greenbag Road Corridor Study (2015) identified pedestrian facilities to connect the neighborhood schools with the commercial and residential areas as a key issue for community safety and access." To ensure that the Project meets community needs identified in the MMMPO plan, the Mon Valley Green Space Coalition respectfully requests the following modifications to the DOH Greenbag Rd Improvement plan: • Instead of sidewalks, a multi-user asphalt side path should be built on the N. side of Greenbag Rd along the entire length of the project area. This will facilitate use by both cyclists and pedestrians while offering a safety barrier between users and vehicular traffic. • This multi-user side path should extend to the current signalized intersection of Greenbag Rd and the Mountaineer Mall. • The project should be amended to include a marked pedestrian crossing from the north side to the south side of Greenbag Rd. A designated, safe crossing of Greenbag Rd. will serve residents from low-income neighborhoods who travel on foot and by bicycle to reach the grocery store. Such a crossing will also serve the community by facilitating the connection of two key recreational areas—White Park and Dorsey's Knob Park. A HAWK beacon (High-Intensity Activated crosswalk) at the current western terminus of the project would serve pedestrians and cyclists without disrupting traffic flow because it is inactive unless activated by a pedestrian or cyclist. In addition, as outlined in the October 22, 2020 "Review of Environmental Assessment" prepared by Downstream Strategies and Ltt Soil, there are significant, negative environmental impacts of a roundabout at the intersection of Greenbag Rd., Kingwood Pike, and Dorsey Ave. These include: (1) the loss of prime farmland—farmland that currently serves as a community garden; (2) relocation of streams resulting in destruction and the permanent loss of wildlife habitat; (3) and, disturbance of wetlands due to increased stormwater runoff. For these reasons, the Mon Valley Green Space Coalition respectfully requests that an alternative to the proposed roundabout at Greenbag Rd./Dorsey Ave/ Kingwood Pike be adopted.

840	A round about doesn't seem necessary at the intersection of Greenbag Road and Kingwood Pike. A turning lane should be sufficient. Not to mention the streams that natural buffers that will be severely negativity impacted with this project. I live close to the intersection and commute it often, a roundabout seems like over engineering of an intersection. To be fiscally and environmentally responsible please reconsidered the option to improve this intersection.
841	I am a resident of South Park who frequents Greenbag Rd en route to Giant Eagle for grocery shopping. I am often worried for people walking and biking along the road with so much traffic and no shoulder - especially in the winter. I encourage DOH to build a place for people of all ages to safely walk and bike on the entire length of Greenbag Road so people can safely access the schools, parks, and shopping areas along that stretch of road on foot or by bike.
842	I appreciate and applaud everyone's hard work balancing the many interests on this project. It is a very important one for the future of the Morgantown region! As noted in the main page for this project: "Community involvement in the development of the Morgantown Monongalia Planning Association (MMMPO) Greenbag Road Corridor Study (2015) identified pedestrian facilities to connect the neighborhood schools with the commercial and residential areas as a key issue for community safety and access." While I applaud the DOH's work to include pedestrian infrastructure and some bike accommodations on the western half of the project, to not connect hundreds of residents and multiple businesses on the east side of Mountainview is contrary to that statement, and I hope the DOH will strongly reconsider the design from the Dorsey intersection eastward. I'd like to respectfully submit these points for consideration in the design: 1) sidewalk the entire length of the project on the north side of Greenbag is a good option for pedestrians, though a multi-use path would be much safer and encouraging for the average pedestrian or bicyclist 2) I fully support the sidewalk as designed on the east side of Dorsey, connecting Greenbag to Luckey Lane and Mountainview ES 3) I fully support the sidewalk on Luckey Lane, but would like it to extend the entire length of Luckey Lane 4) I fully support the roundabouts as designed. I hate to see the loss of land for the community farm but understand why that is the chosen alternative 5) <<From Dorsey intersection to the east>>: the lack of ped/bike infrastructure on this section of the project is a major concern and contrary to public feedback as noted above. Thus, I strongly recommend (a) a 5' sidewalk on the north side of Greenbag + paved shoulders or bike lanes on both sides, or (b) preferably, a 10-12' multiuse path on the north side of Greenbag from the Dorsey intersection to the eastern terminus of the project to connect the schools to hundreds of residents in the housing developments that are accessed from Jonathon Lane, Ashworth Lane, and Long Branch Drive. ---Alternatively, if the Luckey Lane to Dorsey Ave section is absolutely impossible for ped/bike infrastructure along Greenbag, at a minimum a sidewalk or multiuse path is requested from the Luckey Lane intersection w/Greenbag to the eastern terminus of the project 6) <<From Dorsey intersection to the west>>: I appreciate the bicycle accommodations (3-4' shoulders), but those will be very uncomfortable for the average bicycle rider because of the proximity to high speed and volume of traffic (I've ridden that stretch with my 11 year old son, so we know). I'd ask that an alternative be considered that could support both pedestrians and bicycle riders ---> a 10-12' multi-use path, separated from the road (rather than the ~12' of paved shoulders & sidewalk that are currently proposed from the Dorsey intersection, westward) 7) <<From Dorsey intersection to the west>>: I strongly recommend a safe pedestrian crossing from the western terminus of the sidewalk on the north side of Greenbag (near the Goodyear Auto building) to the south side of Greenbag (Giant Eagle/mall) - a HAWK signal is a good

	recommendation. This could serve significant community interest in connecting White Park by trail to Dorsey's Knob park & trails. To summarize, pedestrians and bicyclists of all ages and skill levels should be supported along this <entire project corridor>, ideally with a 10-12' multi-use path separated from traffic on the north side of Greenbag, alternatively by using a sidewalk and two paved shoulders. I greatly appreciate the opportunity to comment on a project that will have a major impact on our area for decades. Many of us have been working for improvements throughout the entire region for pedestrians and bicyclists, and this corridor is a critical piece of the puzzle. Thank you!
843	From a local perspective of someone who actually drives on these roads every day: The two roundabouts on WV 273 in Fairmont work well because they have multiple lanes and bypass lanes and conversely, the Mileground road roundabout doesnt work well because it doesn't. Traffic still gets backed up there, and I see the same thing happening with the proposed roundabout on Greenbag road for the same reasons. You would be better off with the proposed option of adding turning lanes and looking at changing the sequencing of the light changes so that each green light lasts longer and more traffic flows through at each change (it seems to me that most of the efficiency is lost when traffic starts and stops) Please, do not build another roundabout in Morgantown that nobody here wants or asked for, especially at the intersection of Kingwood Pike and Greenbag Road. Please fix the failed roundabout on the Mileground if you want to work on a roundabout in Morgantown. Also, from the perspective of someone who helps manage a local group with hundreds of area runners/joggers/walkers/hikers.. with the expanded trails at White Park south of the reservoir coming up, Morgantown has a tremendous opportunity to connect trails at White Park with the Trails at Dorsey Knob Park. It would mean so, so much to pedestrian safety if the DOH could install an on demand crosswalk/traffic signal (AKA HAWK beacon) to cross Greenbag Road by Giant Eagle. I have heard of and even personally known too many people who have been hit by cars around town, and coming from someone who knows the area trails as much as anyone, more and more people will want to go from the new trails at White Park to the trails at Dorseys Knob Park in the future. It is actually one of my favorite loops in town to run. It would mean so, so much to the safety of pedestrians crossing Greenbag Road if we could get an on-demand stoplight/crosswalk at this intersection of Greenbag Road. I implore you, please use the installation of sidewalk along Greenbag Road as an opportunity to save lives and install a HAWK beacon /crosswalk across Greenbag Road by Giant Eagle. I guarantee it will save lives if you do it and earn whatever it costs to install several times over. Thank you so much for your consideration.
844	Mr. Ted Hastings lets us dispose leaves on his property that we vacuum off the city streets , he uses the leaves for compost material for his garden. We get the leaves off the street and he gets fertilizing material for his garden. A win for both parties. A roundabout would take most of his gardening space. In my opinion only , I think the state could put in turning lanes and add green arrow signals to allow for smooth traffic flow. Thanks Harry w. Dalton #~city of Morgantown street department superintendent Cell-304-216-8654
845	The Greenbag Road Improvement Project would affect my ability to keep my pantry stocked with nutritive foods and teas. I have an agreement with the owner of the farm at the Dorsey Avenue intersection to sustainably harvest mullein, chicory, dandelion, and many other plants. Option F would be a serious detriment to this. Having to purchase these goods would cost me hundreds of dollars a year. I would like to ask you to consider less invasive options such as turning lanes at this intersection.
846	This is Part 1 of 2 of a continuous comment:

	I am a 33-year-old resident of Morgantown and I have worked for the past two years as the Staff Engineer for the City of Morgantown. I received my B.S. in Civil Engineering from WVU in 2017 and will finish a M.S. in Transportation Engineering in 2021. My research is focused in highway safety, public input and decision-making processes, and nonmotorized transportation data. I first came to Morgantown in 2014. In the time since, I served as chair of the Municipal Bicycle Board for more than 3 years and have actively participated as a member and leader of nearly a dozen other community-based groups and organizations. I was a host and organizer of the 2017 West Virginia Bike Summit and I have participated as a stakeholder, steering committee member, and/or decision maker in the various recent transportation plans and highway safety summits that concern Greater Morgantown. In my current role as Staff Engineer, I am the city's staff representative to the Pedestrian Safety and Municipal Bicycle Boards, as well as the Traffic Commission. My job duties are diverse – I perform traditional engineering work like permit review, designing transportation infrastructure, and modernizing the city's standard details. I manage and inspect roadway construction projects. I help prioritize investments by working with our boards and commissions, and I regularly perform roadway safety audits and transportation studies both reactive to citizen requests and proactive based on things like crash data analysis. Firstly, with a few recommended changes noted below, I strongly support the selected options. The roundabouts are appropriate for these intersections. Although the environmental assessment and justifications chose to focus on the congestion reduction qualities of roundabouts, I believe an equally (if not more) compelling reason is centered around the injurious and fatal crash reductions inherent in roundabouts versus traditional 4-way intersection designs. The existing intersections and alternative options allow for serious crashes to occur from all angles. Due in part to its arterial nature, Greenbag Road experiences high rates of speeding along its entire length, increasing the potential for serious, injurious, and fatal crashes. Morgantown has demonstrated a consistent desire to incorporate complete streets designs. The community has repeatedly asked for safety to be considered at least on par with congestion reduction when designing transportation infrastructure. Decision makers have stated goals for increases in nonmotorized mode share and crash rate reduction. Designs for infrastructure in this area should begin with an assumption that they must accommodate all of these users in explicit ways with dedicated infrastructure. The recent injury and fatality reporting for Mon County shows that we are not meeting our performance measures for nonmotorized injury and fatality reductions. Designs should understand that safety of these users is paramount. It should not consider these users after-the-fact. ~continued~
847	While I applaud the desire to improve the Greenbag Road corridor, it's crucial that ped-bike safety be considered more than is shown in the current plan. Please provide for a shared use path along entire length of proposed road improvements, in keeping with whole complete streets initiatives for WV. With all that right of way to work with, why is the sidewalk right next the road? Pull the same sidewalk (at minimal cost) away from the drive lanes and create a separate shared bike-ped lane, 8-10 feet, asphalt - not a 4-ft concrete sidewalk that no one wants to use. with the school and park nearby, and heavy traffic on greenbag, to put cars immediately next to peds on a busy arterial is not an adequate solution.

	Having walked a child to school along the Collins Ferry Sidewalk for years, I can tell you from first hand experience that a 4-ft sidewalk next to a busy arterial road will NOT be a comfortable experience. The width of the grassy shoulder at NETL between the travel lane and sidewalk - c. 15' wide - makes a world of difference. The desire for a ped connection between White Park and Dorsey's Knob is strong, and follows historic precedent- check the WVU archival images, and you'll see many references to hiking from White Park area to the top of Dorseys. Restore this ped - bike connection with a tunnel under at Cobun Creek; or at least plan the roadway such that a tunnel is easy to add later, when budget allows. With recent investment and interest in outdoor recreation, it's SO important not to leave our parks isolated from each other by major roads, and much easier to make allowances now for a tunnel than try to add one from scratch later. A broader bridge for Cobun Creek to allow peds + creek (at least when water's low) will do nicely. I hope you will give more attention to ped and bike safety on this important roadway project. I've been a bike commuter exclusively for 17 years, and I can say that biking along a narrow sidewalk next to a busy highway is NOT something I want to do unless I really have to. Here, you don't have to. Don't put school kids and park visitors and low income families walking to the grocery next to a highway, give them a separate path. Imagine how you would feel walking your kids next to a truck travel lane. I've walked that corridor now, and it's not comfortable.
848	As a teacher at Mountainview Elementary off Greenbag today, I can not understand the need for a roundabout. I travel this road daily and rarely see buildup. This is unneeded road construction, especially when our current roads are not maintained.
849	Continued from #846 This is part 2/2 of a continuous comment. In the spirit of ensuring that transportation designs around Morgantown help further Morgantown's motorized and nonmotorized transportation goals, I recommend this project consider the following design changes: 1) To reduce speeding, lane widths should always be kept to a minimum. This improvement currently calls for 12'-13' lanes – unnecessary for any design vehicle on a 35mph road. Reducing lane width to 10' or 10.5' would save significant financial resources and would help the road more properly communicate the desired 85th percentile speed. It would reduce crash severity for all transportation users. Recent District 4 improvements have defaulted to this more conservative lane width ideology; Greenbag should follow suit. 2) Longstanding community greenway plans have called for dedicated nonmotorized infrastructure along this underserved corridor. Although I am pleased to see more sidewalks included in recent DOH plans, I do not think that a sidewalk along this route (particularly if it includes a mountable curb) would be the appropriate treatment. The recent 2019 MMMPO Bicycle and Pedestrian Regional plan reiterated the previous plans and called for a shared-use path along the north side of Greenbag Road. I concur with this analysis and request that the designers seriously consider a separated shared-use path as a logical, likely cheaper, more accessible to various modes, and significantly safer option to accommodate cyclists and pedestrians along this route. This would require roadway crossings further up onto Dorsey and Mississippi – both sorely needed due to nearby schools, dense populations, and points of interest. It would reduce the awkwardness of pedestrian crossings which is a known difficulty with roundabout design. It would honor the significant resources placed into recent plans by the WVDOH, FHWA,

	MMMPO, local municipalities, and citizens. Such a sidepath would be easy to incorporate as it is, and made even easier by reducing the shoulder and lane widths. This sidepath should extend the length of the project. 3) If a sidepath is not possible from Mississippi up the hill to the mall and designers deem a sidewalk more appropriate, then a bicycle climbing lane should be included in that section. With recently announced resources pouring into recreational and trail development in this area, the presence of cyclists will increase dramatically in the next 2-3 years. 4) A sidewalk and sharrows should be included along the entire length of Luckey Lane to accommodate a natural desire path. 5) Comments undoubtedly left by others have likely called for connections across Greenbag to the Mountaineer Mall. These connections will absolutely need to be made at some point in the near future – if the WVDOH cannot fully incorporate them into the current plan due to lack of formal infrastructure on both sides, it would be an extremely appreciated gesture to ensure that what is built would not preclude, but rather facilitate their future construction. 6) Strongly consider working with property owners along Greenbag to reduce access points and curb cuts, particularly on the north side of the road near the Mall.
850	What are the impacts of the light pollution created by the options?
851	The Monongahela Group of the WV Chapter of the Sierra Club opposes placing a roundabout at the intersection of Green Bag Road and Kingwood Pike. The Hastings family generously provides a portion of their land to the Conscious Harvest Cooperative. The family has expressed concerns that it will no longer be able to support a community garden if a portion of the farmland is utilized for the roundabout. The mission of Conscious Harvest Cooperative is to create a hunger free future for WEst Virginia by facilitating food system change. It has multiple community partners, including but not limited to, the Morgantown Seed Preservation Library, Farm to Families, The Shack NEighborhood House, Mountain Harvest Farm, Round Right Farms, Firsthand Cooperative, WVU Food Justice Lab, WVU Community Food Systems Lab and Milan Puskar HealthRite Friendship House. Teh majority of these partnering cooperative farmers also provide assistance to teh local low-income population. In addition to the promoting physical health to disadvantaged populations, Community Partners also serve those expeirence homlessness, mental illness and those in recovery from addiction. During the pandemic disadvantaged populations that utilize support from Friendship House have not had access to this serivce aside from outdoor programs such as those facilitated at Conscious Harvest Cooperative. The WV-DOH conclusion that "No productive farmland is impacted" at this site is incorrect. The USDA soil survey clearly identifies these soils as "Farmland of Statewide Importance". The Environmental Assessment clearly illustrates the Conscious Harvest Gardens at this intersection in the various aerial photos, yet Figure 12 does not include them as Farmland. Please reconsider using this property as a site for a roundabout as it provides a livelihood for farmers, resources for disadvantaged populations and research for a more sustainable future. It is a valuable resource to the Morgantown Community.
852	This roundabout is a big waste of money. Just add some turning lanes at Green Bag and Dorsey Ave, and add some left turn lights at the current traffic signal. The roundabout is a dangerous and accident waiting to happen.
853	Details in the Environmental Assessment (EA) about our nonprofit business, Conscious Harvest Cooperative, are not adequate and require redress. The EA states,"Impacts to the community garden have been minimized to the extent practicable." This may misrepresent the scope of the project. The area used by Conscious Harvest Cooperative is almost completely within the limits of disturbance. The value of this community, cultural, and agricultural resource would be destroyed if the project moves forward as currently designed. The design and build portions of the

	project around the waterways and tree-line are concerning will effect our business and may be significant. We have grievance with the fact that our entire 501(c)(3) nonprofit designation will be at risk if the proposed roundabout (Option F) is chosen. Conscious Harvest Cooperative formally request an Environmental Impact Statement (EIS) be fully prepared to the best of the State and Federal Governments' ability to address the inadequacies and omissions in the EA. The land Conscious Harvest Cooperative is located on has a soil type of Statewide Importance for Prime Farmland. It is listed within the USDA registry as Prime soil type and is of protected designations. Conscious Harvest Cooperative formally requests a Land Evaluation and Site Assessment (LESA) as protected by Federal Law. This process of LESA was not afforded to our business, this is a violation of the National Environmental Protection Act (NEPA). Let this letter serve as notice that our organization intends for remedy. Conscious Harvest Cooperative formally requests an Environmental Impact Statement (EIS) be fully prepared to the best of the State and Federal Governments' ability to to acknowledge that our business is adequately represented and the impacts to the soil, community, and business are correctly assessed, as required by State and Federal Law. The funding for our Farm to Families Program, in part, comes from renting community garden spaces, as well as, fundraised and donated monies. This cornerstone program is an income based subsidized Community Supported Agriculture (CSA) program that connects individuals and families with fresh local produce. Partner organizations join our Cooperative to access healthy food vouchers. This CSA program connects local farm and community agencies. Shareholders are then provided with CSA shares at a subsidized price. The community garden is the backbone of our outreach programs. By renting community garden spaces, we generate significant income to fund such projects. The loss of these community garden spaces would severely damage our nonprofit. In 2020 the Cooperative invested an estimated $9,555 back into the local food economy, purchased an estimated $6480 of produce for families, and provided an estimated 2000lbs. of produce to West Virginia families, these figures are annual and exponentially growing. Loss and/or damages to this program and other similar programs is significant and will require remedy and/or mitigation. The Farm to Families Program provides qualifying families access to fresh local produce. We directly procure from local farms such as Mountain Harvest Farm. The food is delivered to locations such as The Shack Neighborhood House in Osage, WV. The food is distributed to qualifying families. Without our cost-share program, these families may not otherwise have access to fresh, local produce. This is a significant impact to these families involved, as well as a significant impact to Mountain Harvest Farm, and our nonprofit business. It may be determined that remedy is necessary for all concerned parties and/or mitigation. (Continued)
854	Continued from #853 Nonprofits would be affected as well, such as the Friendship House. The Friendship House rents a garden plot for their program that allows for a space for recovering addicts to go into nature with members of a treatment group to find relief. This program was featured on ABC News Pittsburgh. The loss of these types of programs would be significant to the recovery community, the Friendship House, and Conscious Harvest Cooperative and would need to be redressed and/or mitigated.

	Local businesses would be affected such as Mountain State Brewing Co., this business relies on our organization to dispose of wood ash from their wood fired ovens. This ash is not accepted as municipal waste and is not allowed to be dumped at their location by the river as noted by the Monongalia County Health Department. Our organization saves this business time and money by remediating this waste into a usable agricultural amendment product. Loss to businesses like Mountain State Brewing Co. and Conscious Harvest Cooperative would be significant and remedy required and/or mitigated. Fundraising is a large part of our nonprofit business. Though the garden itself is within a portion of the land for our farming and gardening activities, the land as a whole serves as an area for fundraising. Access to this land for music venues, cookouts, and other events is significant and loss of such land access would impact Conscious Harvest and damages may need to be awarded for such disturbances to our business. Conscious Harvest has significantly improved the land in whole, and has used donated monies and earned monies for the gravel in the parking lot. Volunteer labor has maintained the driveway entrance and road access. These donated and earned monies and donated labor will need to be assessed, reimbursed, and remedied while considering the donated labor of the trucking company who delivered the gravel including: fuel usage, wear and tear of equipment, and time to spread the gravel and/or mitigation. Perennial plants bought from monies donated and earned as part of a beautification project are significant and would need to be reimbursed and/or mitigated. These plants include, but are not limited to: beautiful, hearty fig trees that require years of growth before fruiting. The fence around the garden was built with donated and earned money and will lose integrity if moved. This fence would require a substantial amount of labor and possibly large equipment/trucks to move properly. The labor and equipment rental must be remedied and our business reimbursed for damages incurred and/or mitigation. Moving the fence will require storage for an amount of time to be designated as we look for another location. Storage fees for the fence will need to be established and the finances reimbursed and/or mitigated to the maximum extent of the law. Reconstruction of the fence will be labor intensive and also may require large trucks/equipment and new materials. This should be considered in regards to financial remedy and reimbursement and/or mitigation. The pole barn located along the tree-line was built with a substantial amount of donated and earned monies and volunteer labor. Loss to this structure will be devastating as it will not be able to be moved. This structure is important to our business because it allows for shelter of our clients during inclement weather and also serves purpose during fundraising events. Mitigation and/or reimbursement of monies and labor must be remedied. Reconstruction of the pole barn will be labor intensive and also may require large trucks/equipment and new materials. This should be considered in regards to financial remedy and reimbursement and/or mitigation.

	(Continued)
855	Continued from #854 The tool shed along the tree-line contains donated and purchased tools. Loss of the shed will be significant. The tool shed was built with volunteer time as well as with donated and earned monies for materials. There is an appreciable mural painted on the shed by volunteers and local artists with paint procured by our nonprofit, damages will be significant and mitigation and/or reimbursement will be necessary. Reconstruction of the tool shed will be labor intensive and also may require large trucks/equipment and new materials. This should be considered in regards to financial remedy and reimbursement and/or mitigation. A temporary storage space, in place of the tool shed, for all the tools will be needed. Tools will require storage for an amount of time to be designated as we look for another location. Storage fees for the tools and maintenance of the tools in storage will need to be established and the finances reimbursed and/or mitigated to the maximum extent of the law. The tilling and maintaining of the individual garden beds is significant. Some members have worked their individual plots for years, even before the 501(c)(3) destination was awarded. The fact that they can continually garden in the same location is important to the integrity of the crop, the soil, and our project. Mitigation and/or reimbursement may be necessary as remedy for the hours of labor and materials put into these garden beds. Creation of new garden beds will be labor intensive and also will require large trucks/equipment and new materials. This should be considered in regards to financial remedy and reimbursement and/or mitigation. The ability for our clients to have access to soil of this type, to grow food varieties of their choice, with whatever techniques they choose is significant. The service we provide gives our clients access to local food and creates sustainable food security. This is very important, especially during a pandemic, COVID regulations, restricted store hours, and limited food product availability. The loss to each individual member of our garden may be significant and require remedy to their persons and/or mitigation. Reacquiring land of this soil type, with access to parking, room for a pole ban and tool shed, with consideration to proximity of a metropolitan area, would be burdensome and challenging. The damages to our nonprofit would be significant if this project continues as planned. Access to this land may be irreplaceable. Mitigation and/or remedy may be necessary. Let it be known that standing EA has not allowed for adequate time to assess the full impact to Conscious Harvest Cooperative 501(c)(3). The standing EA appears to have inadequacies and omissions pertaining to the soil type at our location. Exact amounts and values for remedy are to be determined, the burden is ongoing. The design and build phase is concerning; and, additional

	damages incurred to our business may be assessed and reassessed in the future as we continue to identify more damages, as the damages are ongoing.
856	My family has a 120-year-old farm in Monongalia County (longer than Morgantown has been a city-fun fact). Our Farm is in jeopardy of being destroyed and becoming a roundabout. The DOT has given us "alternative options" that include a roundabout that demolishes our farm or turning lanes that are so big they take out my cousin's house and the house my grandpa was born in. We've had huge pushback from the residents as no one agrees with these egregious options, therefore my family, neighbors, and other landowners affected have come up with a community based solution option G: which has one turning lane and installs sidewalks (another thing resident want). Over 500 residents have signed this petition in 24 hours. Our county commissioners unanimously approved the roundabout BEFORE THE PUBLIC COMMENT WAS EVEN OVER. Its like a dictatorship here in Monongalia County, we need the Governors' help!
857	This letter is in response to the September 29th public meeting held by the Division of Highways for the Greenbag Road Improvement Project. We are greatly appreciative of the work you and your team has done in addressing this area of concern for our community and look forward to the continuation of this endeavor. The Morgantown Area Partnership is an organization comprised of the Morgantown Chamber of Commerce, the Morgantown Area Economic Partnership, The Monongalia County Development Authority, and the Campus Neighborhoods Revitalization Corporation. We at the Partnership would like to express our support for this project, especially in regards with the intersections of Greenbag Road at Mississippi Street and Greenbag Road at Kingwood Pike. Our downtown is heavily congested with truck traffic, which is a detractor to our attempts to improve the quality of life within our community. The options for truck and other vehicular traffic to travel Greenbag Road as an alternative to using our downtown as a passthrough - rather than the destination it is - will be a boon for our city and the region. We agree with our partners at the City of Morgantown and the Morgantown Monongalia Metropolitan Planning Organization that this project should commence as soon as possible with roundabouts to allow for a truck traffic alternative to WV 7. Please feel free to contact me with any questions.
858	I, and many others, feel that the DOH is going to be wasting a whole lot of money on the Greenbag Road project in Morgantown for something that is not needed and also not wanted. The proposed $10 million +/- budget will only provide minimum gains where a lot less money could be spent for about the same benefits. It should be quite apparent that a "roundabout" improvement project has not been well received and considered by some to be a "boondoggle." I personally have no problem with most of the improvements though I wonder if a cost analysis was ever done on the roundabout "fix." I feel that about the same benefits could be reaped from a much scaled down project. Let's look at some of the proposed plans and match them up with alternate plans and the reality of the situation. 1. Mississippi Street Roundabout - A stoplight is all that is really needed here. Traffic exiting the schools into a roundabout will be cut off by west bound traffic on the Greenbag Road. Simply install a traffic signal that can controlled with remote switches so bus drivers can turn them on when needed to either enter or exit, or put it on a timer for the start and dismissal of school. 2. While it is conceded that roundabouts at two mentioned intersections may be quicker, the difference is very small. Are roundabouts safer - maybe marginally? How about the argument that roundabouts work when the power is off-If the traffic light does not flash - it should and people usually just take turns. 3. The proposition that the use of Lower Cobun Creek Road can be used as a detour during construction is preposterous. Those combinations of roads around the in-question intersection are in extremely poor condition and curing the potholes and narrow one lane sections would be a very costly proposition. Now let's look at areas that I think we can totally agree on. 1. Our proposal should be cheaper. You wouldn't have to buy as much land and there might be some savings on paving as well. 2. Wider lanes the length of the Greenbag Road. 3. Better berms. 4. Sidewalks and crosswalks. 5. Irregardless of anything else the traffic lights should be on times to reflect the traffic patterns of the area. It is my hope that this letter shows that there are real problems to putting roundabouts on this project but that there are many more things that we agree on that should be done.

859	Change.org online Petition for Option G: A Community Based Solution for Greenbag Road Improvement Project. Signed by 1115 individuals. Summary of Petition: Advocating for an alternative intersection design, called Option G for Greenbag Road/Dorsey Ave intersection that landowners can support. Option G includes dedicated left turn lanes for Greenbag Road with the design features but no added lanes for Dorsey Ave and Kingwood Pike. Design features include widening traffic lanes, adding sidewalks to Dorsey Ave, and paved shoulder on Kingwood Pike. Benefits of this option: improve the safety; reduce impacts to natural resources; preserve significantly more farmland; reduce the amount of impervious surface; limit impacts to existing residences and businesses on Dorsey and Kingwood; account for additional historic and cultural preservation; reduce construction costs.
860	Why would you spend so much money on a roundabout when just widening, turn lanes and stop lights will fix. You spend way to much money on this stuff when there are roads and bridges that need repaired/replaced.
861	I am in favor of anything to improve this intersection. My preference would be turn lanes on the green bag road with a jump light. A roundabout may work, but it would have to be a better design than what the DOH has proven capable of in the past.
862	Please do not do this project. It makes no sense. The pike which would feed into it- it's a hazard normally in the winter- a secondary road- it's poorly maintained- like most of the roads in our counties not necessarily to our state road's fault but that of our state government- lack of competitive wages, benefits etc. Feeding a poorly maintained road into a traffic circle is asking for an accident and possibly loss of life, permanent disabilities which could involve school buses which hold our future of our state. Also the poorly designed traffic circle at the mile ground- it has a school off of it- it does not flow correctly- it jams like a spoke on a wheel- people stop in the middle because they feel scared, feel like we are still living in a small town let's be nice- people are still driving backwards thru it. You slide sideways because it's angled. All the land was not it, used- huge green space that should have been utilized- but we had to make it look pretty. West Virginia needs infrastructure- turn in and turn outs not turning lanes that's impatient drivers use as an extra lane for driving. We need road projects completed in a timely fashion. Road projects completed at night when it can be, for road work here in Morgantown not started as 30,000 college students come back into town.
863	I believe the proposed roundabout is not a useful allocation of monetary resources to improve the Kingwood Pike, Greenbag Road intersection. Widening of the roads to include turning lanes would be a better and more efficient endeavor. Thanks.
864	I think that this road upgrade can be done with turning lanes. A roundabout is not only unnecessary, but inappropriate as large trucks use this route and would be unable to maneuver through a roundabout.
865	I live off of Greenbag Road and drive through the intersection of Dorsey Avenue/Kingwood Pike and Greenbag Road daily. While I don't know that the "farmland" needs to be saved, I do believe that a roundabout in that location is not needed. At most, a turning lane with a leading green would work. However, returning to the days of a 4 way stop is all that is needed. The only cost incurred would be the pay for an employee to go out and set all of the lights to blinking red. Please don't spend more money than needs to be spent, not to mention the inconvenience to all of the residents, businesses, and school traffic in that area.
866	Put in the turn lanes and dedicated signals that were originally planned when you removed the perfectly acceptable functioning four way stop. Do not make a bigger mess than you already have. And unless it is mandated, trucks are still not going to use Greenbag Road, it is still quicker to go through town.

867	I strongly dislike the option of a roundabout. Why can't there just be turning lanes added to the Kingwood Pike intersection and a stoplight and turning lane be added to the Mississippi street intersection? As someone who drives through those intersections multiple times a week, I don't see roundabouts helping to improve traffic flow. Instead it will increase congestion, and likely lead to more accidents in that area.
868	There isn't traffic congestion on the Greenbag Road to warrant the use of tax payer money to build a round-a-bout. If you want to fix a problem area look at West Run Road. There are areas of that road that two vehicle can't pass.
869	I like the plan for Greenbag road, specifically the roundabout. This is a highly traveled road with 2 schools and a minimum security prison, and traffic often backs up at the proposed location for the roundabout. Also need improved marking of school zone outside South Middle
870	I drive this road daily during the morning and evening busy times. My oldest attends Covenant Christian preschool not far from this intersection. The traffic is no different than anywhere else in Morgantown during this time. I do not support the installation of a roundabout and the use of eminent domain to seize private land for this purpose. Please reduce the footprint, perhaps add a turning lane instead, or do nothing because honestly it doesn't add much time to wait. Thank you.
871	Trucks destroy Greenbag Road and are the worst part about traffic in the road - no trucks at all. The 4-way stoplight at Kingwood Pike, all that light needs is turning lanes. Turning lanes will improve it, while a roundabout will not help with improvements and will destroy much needed land.
872	I want to express my full support for the roundabout and all improvements on Greenbag Road in Morgantown. You do so little for our county, I believe this is the least you owe this state's third largest county. Please move forward with it.
873	No roundabout at Kingwood Pike, please!! Make turning lanes instead. Nobody has convinced the public why a roundabout would be better than turning lanes. And it does not justify forcing private property owners to sell their land to accommodate a roundabout. Aaron's Creek Road would have to be widened and repaired before it could serve as an adequate temporary detour for two-way traffic. That in itself would be a massive undertaking.
874	I often drive through this intersection around 5 pm. While traffic may backup through a few stoplight changes, the culprit is lack of left turn lanes rather than traffic volume. A roundabout with resultant taking of private property seem like using bomb when a fly swatter would do. A backup at other times of the day is rare, again due to lack of a left turn lane.
875	I fully support the project as proposed. I think it will greatly improve traffic flow on Greenbag Bag Road. The traffic lights that were put in at Dorsey Ave, Kingwood Pike and Greenbag Road only helped traffic flow in an hour or so in the afternoon. Other times the 4 Way Stop Signs were far more efficient.
876	This dangerous intersection is long overdue for reconfiguration. I fully support the proposed traffic circle
877	Although I don't have a problem per se with the plan, I do not think that it is needed. On average I travel that road weekly and never have problems with traffic. On the other hand, 857 between Pierpont Rd and Tyrone Rd is horrendous. Traffic backups occur daily and even on the weekends before things slowed slightly with the pandemic. Please spend the funds to widen the intersection of 857 and Tyrone Avery which would have much better impact than putting up a stop sign and stoplight which has only slowed down traffic.
878	We don't want a roundabout. The stoplight is fine. Put the money to fixing our roads (potholes) and let those people have their farms.
879	I am a long time resident in Morgantown's First Ward. As such I travel on the Greenbag Road via Mississippi Street frequently. I use this route in both directions, to Sabraton and to Don Knotts Blvd. I use it at various times of day, including busy times. I honestly never encounter any traffic problems at the intersection with the Kingwood Pike or with Mississippi. I oppose the proposed project which seems out of proportion to

	any need at either intersection. The 10 million could be much better spent to repair and improve Route 7 from Sabraton to and through Morgantown. That stretch of state road is in terrible shape. Narrow, poorly ditched and drained, dangerous turn, and pot holes beyond belief. Thank you for reconsidering this project.
880	I travel the Greenbag road every day of the week. I strongly support the construction of a traffic circle. It would greatly improve the intersection with the Kingwood Pike. I can't believe that a few people have delayed the project and are trying to stop it.
881	I fully support this project. 857 at Dorsey Ave is a nightmare, and a roundabout would do much to improve the traffic flow. People will complain about losing their property or increased traffic through neighborhoods, but that is an unavoidable fact of life when the city you live in is growing and you live adjacent to main routes. They need to get over themselves. Please move forward with these improvement as soon as possible.
882	Roundabouts are NOT needed. If you'd widen those intersections and have dedicated left hand turns with they're own lights, and a continued straight through lane, you'd save ALOT of money.
883	The Americans with Disabilities Act requires that all new and modified intersections, including roundabouts, be accessible to and usable by people with disabilities. How will the WVDOH address the accessible to and usable by people with disabilities for each alternative intersection design? Specifically, Federal Highway Administration, Office of Safety, stated Pedestrians with vision impairments may have more difficulty crossing roundabouts due to the following key factors: 1.) Pedestrians with vision impairments may have trouble finding crosswalks because crosswalks are located outside the projection of approaching sidewalks and the curvilinear nature of roundabouts alters the normal audible and tactile cues they use to find crosswalks. 2.) Roundabouts do not typically include the normal audible and tactile cues used by pedestrians with vision impairments to align themselves with the crosswalk throughout the crossing maneuver. 3.)The sound of circulating traffic masks the audible cues that blind pedestrians use to identify the appropriate time to enter the crosswalk (both detecting a gap and detecting that a vehicle has yielded).
884	According to FHWA, proximity of generators of significant traffic that might have difficulty negotiating roundabouts, such as high volumes of trucks or oversized vehicles (sometimes called "superloads"), may significantly influence the design requiring that a more detailed investigation of some aspects of the design or operation be carried out. Which site-related factors were investigated? Were "superloads" considered in the "Option F" roundabout design?
885	The Environmental Assessment fails to analyze the physical constraints for the intersection at Kingwood Pike/Greenbag Rd including steep grades, presumably "unfavorable" topography, and intersection skew. The WVDOH must address the topographical considerations and corresponding analysis given for each alternative intersection design.

	Topographical considerations include, but are not limited to, heavy logging trucks entering the intersection on a steep grade from the South, a geological slip on the southeast corner of the intersection, and extensive leveling and retaining walls needed for each alternative. Further, the intersection is located on an Oversized Truck Route (Greenbag Rd), please provide the geometry, splitter islands, truck apron, and off-tracking needed to accommodate the appropriate vehicles, and the associated land needed to accomplish each design.
886	A roundabout seems unnecessary in this location; however, any option that results in truck traffic being rerouted away from Brockway, South Park, Greenmont and downtown would be a huge improvement. If that can't happen, leave it as is or return to a four way stop.
887	I fully support the Green Bag Road improvement project, provided it is mandated that heavy truck traffic use this route rather than drive through downtown Morgantown (as they currently do). While I understand the reason this project is opposed by a small local farm, I believe the benefits for the greater community outweigh the preferences of a few people. The downtown truck traffic is a significant barrier to the revitalization of the city center, and it will benefit the community to have it removed.
888	There are many places in this county that this much road money could be put to better use - cut the brush along the roads, clean out the ditches so the water doesn't run out onto the road and cause more ruts, patch the potholes. The Arnettsville bridge on Route 19 was replaced with a bigger bridge but the other bridge had worked well for years! Buses have passed through the Greenbag Road/Dorsey Ave. intersection for years and have always been able to keep there schedules. Are you telling me that the traffic through there has increased by a hugh amount?
889	As a local resident and frequent cyclist, please strongly consider robust bike/pedestrian access to the Greenbag road corridor. This corridor could serve as an important connector for businesses and neighborhoods to access the Deckers Creek trail and Sabraton area. Additionally, cyclists frequently travel portions of the Greenbag road area to access Aarons Creek neighborhoods etc. A related but separate issue that should be considered is pedestrian/bike access under Greenbag road to connect White park trails to Dorsey's knob park, with access to businesses and services such as MUB's offices along the way. A safely bike-able/walkable Morgantown is key to our City's long term growth and wellbeing!
890	I do not agree with the decision to put a roundabout on greenbag road. I live in the first ward area and drive on that road daily. A turning lane at the intersection of greenbag/Dorsey/kingwood pike would be more than adequate for the traffic. The argument that it will increase the truck traffic does not seem likely since they can use the road now and do not. I do not see how putting in a roundabout is going to make it easier for trucks to use the road. This project seems like a waste of money that could be used for other projects. Dorsey is in desperate need of sidewalks. This is just one way that the money could be used in a useful way.
891	I believe roundabouts are a horrible way to deal with traffic. The loss of green areas.in Morgantown is sad. Each town I come home to visit I am disappointed in the removal of the green fields for the greed of businesses.
892	LEAVE THE FARM AND THEIR FAMILY ALONE! THESE ROUNDABOUTS ARE A WASTE OF LAND AND MONEY! WV DOES NOT NEED TO BE TAKING UP FARMLAND AND PEOPLE'S HOUSES FOR ROUNDABOUTS. PUT IN STOP LIGHTS AND SIDE WALKS AND LEAVE THE FOLKS ALONE!!! I LIVED IN MORGANTOWN FOR OVER 50 YEARS UNTIL RECENTLY. FARMS PROVIDE FOOD....THAT GOES TO THE STORES. IF WE KEEP TAKING FARMLAND FOR THIS AND THAT PRETTY SOON FARMS WILL NOT EXIST! AND STOP BOWING DOWN TO WVU , THEY ARE TAKING OVER THE STATE LIKE COMMUNISTS TRIED TO TAKE THE WORLD OVER! NO ROUNDABOUT! AND THOSE THINGS ARE DANGEROUS! LEAVE THE FARM AND HOUSES ALONE AND PUT IN TURN LANES AND STOP LIGHTS AT THAT CORNER. AND SIDEWALKS. AND THEN LEAVE THINGS ALONE!

893	I think a roundabout is a great and much needed solution to this intersection. Obviously the people whose land this will affect are opposed to this. Their argument for a turning lane with sidewalks is a weak one and I don't think will help reduce traffic like a roundabout. Build the roundabout.
894	I truly don't understand why the DOH feels that round about's are the answer to everything. They wanted to put one in Sabraton and it would have been a disaster. The round about on the mileground is to small. I agree that a turning lane would be the best solution to the traffic issues on Greenbag Road. I also don't understand why Fairmont and Clarksburg have 4 and 5 lanes each way on 79 and Morgantown which probably has more traffic and is only has 2 lanes.
895	I live right by this intersection and a roundabout is not needed!! A left turning lane on Greenbag Road would fix the traffic issue. I am VERY AGAINST destroying all that green space for a roundabout that nobody wants!!
896	I am 100% for the roundabout planned on Greenbag road in Morgantown. Traffic due to turning left from either direction on Greenbag is way too difficult.
897	Keep it Simple, make a turning lane. I've traveled through that intersection for decades. Listen to those who experience the traffic problem.
898	Please it alone
899	Please do a turn lane. There is no need for a roundabout. There is only a window of high traffic and that is 3-6 window. A turn lane will alleviate this need. - Keep supporting farms and families.
900	There is no reason for the roundabouts in that area. You will destroy 3 properties to save a 2 times per day when people complain. Buy the old restaurant and put in turning lanes in to solve the problem. There is plenty of land in the old restaurant area to expand the road and change the traffic pattern.
901	The roundabouts are not a horrible idea. I worry about the construction phase, it would have the area shut down for some time. A lot of people use the pike to get to and from kingwood or as an alternate route when 7 is closed. I think the pike/greenbag intersection would be better suited with a long right-turn lane on every approach (or even just on greenbag rd). In addition to that, all the approaches need a dedicated left turn lane with a light that works correctly. This would allow all right turning traffic to go on red if able, the straight thru cars will be ready in a line and will be more efficient, and the left turners can be in their lane. This would widen each road by only two lanes each (and could be mostly done without affecting traffic flow). You could add another lane for right turners to turn then merge as well. Even if just greenbag had right turning lanes dedicated that could go on red, and dedicated center/left turn lanes that were light controlled, that would increase flow. I don't understand why there are sidewalks, i have never passed a pedestrian walking on that road. Maybe because there are no sidewalks, but maybe because no one does. Also, if the roundabout goes in, why would you want to cross both directions of traffic as a pedestrian. Why not go to the center then whichever direction you needed. The proposed plan show each crosswalk crossing both directions of traffic, so now i have to think, nothing left or right, and nothing turning from the circle towards me. If crossing directly into the center, you only have to look at one direction of the cars travelling counterclockwise.
902	A round about a both locations make the most sense. I am tired of a handful of complainers stymying improvement of transportation issues in Morgatown. I chaired the 1997 Transportation Study and few of the recommendations made have come to reality because of complaints from less than 1% of the the county's population! Due what you know is the correct plan.

903	I would like to express my opposition to both of the proposed roundabouts on Greenbag Road. The intersection with Kingwood Pike works fine with the traffic light. A left hand turn light & lanes makes more sense than taking the Hastings family land & the farms for this roundabout. Arguments, such as proposed by Mr. Austin of MPCO, that the traffic lights go out in bad weather are just irrelevant. How many times per year does that even happen? "If it ain't broke, don't fix it" Is my advice. Same for the intersection with Mississippi Street. No need for a roundabout there, at all. Please devote your resources to projects that are needed instead of wasting resources on these 2 roundabouts.
904	Please consider alternatives to the proposed roundabout on Greenbag road. Turning lanes, for example, would have much less negative impact on the surrounding homes, farmland, and visual aesthetic, as well as being less confusing for drivers.
905	This decision to make a round about at the end of the Kingwood Pike is nonsense. 1st, there is not enough traffic that would would should even spark the idea of this type of change. I have been driving that road from Kingwood to Morgantown for over 25 years and I have never seen the intersection backed up like something of what was on the Mileground. If anything, just do a turning lane at the intersection of the Pike and the Greenbag Road and that would do the job. The family with the farm should be able to continue to keep their land. There are too many projects in the US that are ruining farmland. We need to preserve our farmland for the future. I don't think any thought was put into the project as far a detouring either. Aaron's Creek Road is not fit for traffic while the project would be in progress. That would hold up school buses as well. Please DO NOT do this project. Keep the Kingwood Pike and the farmland as it is now.
906	Two roundabouts in such a short distance makes no sense. The Mississippi Street area does not even have a traffic light now! Why is a roundabout needed at that spot, let alone the Kingwood Pike intersection? There was to be at least one turning lane when the traffic light (that replaced the 4-way stop) was originally put in at the Kingwood Pike/GB Road intersection. That NEVER happened--no money was the excuse. Aarons Creek Road is a disaster to use as a detour. Has anyone ever tried to drive that road in the winter time or even in good weather? I double dare you to do so -- that includes DOH employees, our County Commissioners and the MPO. You take your life into your own hands as you try to get onto the Pike from Aaron's Creek to turn left or right! The construction company working (MUB DAM PROJECT) the other side -- Cobun Creek, which is not nearly as dangerous--has 2 flagmen stopping traffic to get their vehicles in and out. Will someone be stationed at Aaron's Creek to flag traffic in and out safely. NO, of course not. This is a big waste of money when turning lanes or a left arrow on the light would be the best and least expensive solution. NO TWO ROUNDABOUTS. Is it going to be a money maker after completed to charge for an amusement ride of loop de loops?
907	I live in South Park and travel often using the Green Bag road, at various times of day. I understand that traffic circles are proposed at the intersections of Dorsey and Mississippi streets. These are both unneeded and very costly projects that better solutions could be made. At Greenbag and Dorsey traffic increases in the rush minutes or when school busses are present at 2:30 PM and again at 5 pm. A turning lane would seem to be a more sensible solution here, with a traffic light allowing left turns. Mississippi dead ends at Green Bag so a three road circle is proposed. Hiring a crossing guard to allow school busses to enter Green Bag at two times a day would be a whole lot cheaper, and maybe a traffic light triggered to change when busses are present would work. The savings could be used to properly fix the road surface on Rte 7 which is in deplorable condition from Green Bag most of the way into downtown Morgantown.
908	I visited the Greenbag Improvement site on line find out more about the plans to construct roundabouts on Greenbag Road. Many citizens have submitted comments and, of the 264 comments published on the site, I found only16 that were in favor of the roundabout plans. Those opposed noted that there are few times during the day that there is any backup of traffic and suggested that turning lanes would alleviate that problem. The poor road conditions, from the Kingwood Pike to others in the area, were mentioned with concern that maintenance needs to take precedent over costly new, unnecessary construction. The site also summarized submitted concerns and presented responses that supported

	the roundabout decision that address “both current conditions and design year 2048 predicted conditions.” While it is admirable that the plans are made with the future in mind, I am looking forward to seeing if the overwhelming public responses against the project will be heeded.
909	I firmly believe we should protecting as much of our green space as possible, and as a resident of Morgantown, all I see is the opposite. A new development here, a new roundabout there. We’re developing beyond our needs.
910	I'm trying to view the Environmental Assessment for this project, but the link isn't working. Can you offer any assistance?
911	The option as listed below, combines dedicated left turn lanes for Greenbag Road (as in Option D) with the design features, but no added lanes for Dorsey Avenue and Kingwood Pike described in the Executive Summary of the EA. These design features include widening traffic lanes, adding sidewalks on Dorsey Avenue, and adding a paved shoulder on Kingwood Pike. This new option would have numerous benefits. It would: Improve the safety and access for motorized and non-motorized connections; Reduce impacts to natural resources; Preserve significantly more of the adjacent farmland of statewide importance; Reduce the amount of impervious surface, causing fewer impacts to nearby streams and wetlands; Limit disturbance to unsuitable soils with a history of slips to prevent likelihood of property damage or loss; Limit impacts to existing residences and businesses on Dorsey Avenue and Kingwood Pike and account for additional historic and cultural preservation; Reduce construction costs. Refer to this proposed option as “Option G”. I support this “Option G ‘ as “preferred”
912	As a resident of Morgantown and frequent user of Greenbag Road, I do not support a traffic circle at Greenbag and Dorsey. I greatly value the farm on that corner and the value it provides to the community. I would prefer a turn signal on Greenbag, which would help elevate the traffic congestion at that intersection. Thank you
913	I love roundabouts but I do not support one at this intersection. I travel this way every day. It really isn't that busy. All it needs is a turning lane and an arrow or even go back to the 4 way stop. Honestly, there are several other intersections in Morgantown that could use improvements over this one. The only time it is even backed up is for about 6 minutes when the school lets the buses out of the parking lot. Downtown gets 1,000 times more traffic and all they use are turning lanes. Please put in a stop light at the parking lot exit of the Walmart on University Town Center (near the WVU Medical office side) instead - now THAT is a pain to get out of and dangerous.
914	I strongly approve and encourage the proposed Greenbag Road improvements. Especially including roundabouts.
915	Please add crosswalk to connect White Park and Dorsey Knob. Also, preserve the community garden. We need more community spaces
916	I support the proposed roundabouts for the Greenbag corridor in order to improve traffic flow and to encourage truck traffic via that corridor rather than through the downtown area. Multiple roundabouts are a must; the backups that occur in the mileground area are the result of establishing only one. We have witnessed the success of multiple roundabouts in Florida and other parts of the country and are firm believers in the various benefits of such configurations. It's our hope that the MMMPO will move forward with these plans.

917	Please complete the vitally needed roundabout and sidewalk improvements on Greenbag Road. A 70 acre farm can afford to sacrifice just over one acre for something that would do so much good for our community. We have the third most populous county in this state (and growing) while state government spends precious little on our infrastructure needs. This modest investment in our community is of vital importance to us.
918	The roads we have need massive repair. Why build new roadways when we can not fix the ones in place. That makes no sense whatsoever.
919	I brave Greenbag Rd every day- sometimes more than once. Greenbag Rd only needs a turning lane at the intersection of Dorsey! Traffic flows well otherwise. A roundabout is a waste of tax payers money and destructive to the business and agricultural land in that area. The roundabout that was 'so necessary' to ease traffic flow on the Mileground is a complete nightmare and has done nothing to ease congestion. A roundabout at Greenbag/ Dorsey/Kingwood Pike will be just as disastrous! Spend our money wisely city council! Morgantown traffic needs improvements not more nightmares!!
920	I general I support the overall design of improving Greenbag Road including the two roundabouts. It should enhance traffic along this road and hopefully reduce large vehicle traffic on Route 7 through downtown Morgantown. However, I feel that pedestrian and cycle safety and use would greatly benefit from a shared path design rather than sidewalks. Other cities in the U.S. have implemented the shared path model for pedestrian and cycle improvements along major thoroughfares. Secondly, the present design limits safe access to the Mountaineer Mall. I suggest a signaled crossing at this property. Thank you for the opportunity to provide this feedback.
921	As residents of Bluegrass Village, my family will be impacted by this project on a daily basis. We are well aware of the rush hour traffic congestion on Greenbag Road which often makes it difficult to enter or exit Bluegrass Village at these times, and westbound travel toward 119 is often delayed by incoming and outgoing school traffic on Mississippi. We would be fully supportive of Alternate 1 with the 2 travel lanes and continuous turn lane between Mississippi and Dorsey/Kingwood Pike. As a long-time resident and witness of a number of road "improvement" (some more so than others) projects, the center turn lane concept seems to have helped greatly with traffic congestion on Route 7 near Krogers in Sabraton. We are also fully supportive of Alternative 2, Options A (a much needed traffic signal at Mississippi Street) and E (dedicated turn lanes at Dorsey/Kingwood Pike intersection). We witness traffic congestion on a daily basis resulting from the lack of a signal at Mississippi and the lack of turn lanes/left turn signals and the Dorsey/Kingwood Pike intersection. We VEHEMENTLY OPPOSE the construction of a roundabout at either location. Roundabouts seem to be satisfactory in quaint one intersection small towns, but in our experience do not handle large volumes of traffic well. The roundabout on the Mileground is an absolute nightmare such that we and many other local drivers take detours to avoid it at all costs. We absolutely DREAD the prospect of being hemmed in by roundabouts in both directions when exiting Bluegrass Village. Finally, we are fully supportive of plans to construct a sidewalk along Greenbag Road.
922	Why has an archeological survey not yet been conducted? It is my understanding artifacts, and historical items are of grave importance when demolishing land with such a rich history. The landowners are prepared to go forward with an official archeological dig if the Project leaders do not prepare one.

923	The roundabout on the mileground has proven to be a hellacious nightmare 75% of the time. What are those times? School dismissal, changing classes for WVU students, and after work traffic. A roundabout on Greenbag road isn't going to make the clustered traffic at peak times better, it's going to make it worse, because so many people don't understand roundabouts and it takes way longer to get through than necessary. I can count 5 times in the last month that I've sat in standstill traffic in the roundabout, leading up to, or leaving for 15+ minutes. This just seems like a lose-lose situation for everyone.
924	I live on The Pike. We do not need a roundabout. You cannot be serious with an Aaron's Creek detour. Someone will get killed on that road, and will sue the state and win. This is a disastrous move.
925	Just add a turning lane to each side of the 4 way light. Simple. Traffic isn't like it was there 8-10 years ago, so that will work just fine. A roundabout in Morgantown is not a good idea. Noone knows how to use them & it's just more frustrating for drivers. In addition, eminent domain is vile unless the situation is dire-- and certainly this situation is not.
926	Please discontinue the plans for the Greenbag Road/Kingwood Pike roundabout. I've been a resident of the area for nearly 25 years, and while the four-way stop was a nightmare, the current stoplights are sufficient traffic control. If the issue is turning, you could alter the timing to effectively address this need. The cost-benefit of the roundabout is clearly heavy on the cost side with limited, if any, benefit. This roundabout's financial cost is high, and the impact on the current landowners is extreme. The roundabout planning should be suspended. I travel the road and traverse the intersection on a daily basis, so I'm speaking from an educated user's perspective. Thank you for the opportunity to provide comment, and I hope you will consider the public perspective. Sincerely, David Michael
927	I do not support the construction of a roundabout on Green Bag road. I believe a better option would be to construct turn lanes on Green Bag road.
928	Turning lanes on the Kingwood pike is a better option than a round about that destroys green space, farmland and people's property and homes.
929	I travel through this intersection frequently. The amount of traffic and the wait time for the light is minimal. I travel through here so I don't have to deal with the congestion in Sabraton. A turning lane would be more than sufficient for this intersection.
930	Putting a round about/traffic circle at the intersection of Greenbag Rd and Dorsey Ave makes no sense, monetary or otherwise. There is no need to spend lots of money and time to fix such a minor problem. A simple fix would be to put turn arrows and turning lanes in on Greenbag Rd. No need to destroy peoples' property and spend money that could be used to fix many of the messed up roads in the area.
931	I strongly oppose the conversion of family farmland near Greenbag Rd into a roundabout. Morgantown is such a special city because it combines the cultural resources of a much larger community with abundant natural beauties–lakes, creeks and rivers, forested hills, and productive family farms. Once a wooded hillside or family farm is gone, it is gone forever. It is especially inappropriate that this valuable resource would be sacrificed to facilitate traffic in our city, which is already at the saturation point.
932	NO.
933	I travel the Kingwood Pike everyday. The options for detours for larger trucks and school buses is non existent. The intersection only needs turning lanes. Please consider the public's cry for no round about. Thank you.
934	Roundabouts are a hassle in my opinion. Lot of wasted space that can be handled much better with turn lanes. I find them confusing and a traffic accident waiting to happen. If this is going to cause people to lose their home it is better to use the less confusing turn lanes. I try my best to avoid the roundabouts that are in town as it is. This one will be by my church and I am not pleased by the thought of it.

935	The proposed project is contrary to the public interest.
936	Build this roundabout already. It's the best solution for most intersections. Please change more intersections to roundabouts, the Patteson, Buroughs, van voorhis intersection should have been a roundabout 20 years ago.
937	I request that an Exit be put at the I-68 bridge right up the road the proposed Greenbag Roundabout. The proposed roundabout will interfere with my plot(in Hastings Farm) on which i plant corn & vegetables for my family.
938	The WVDOH has failed to provide information sufficient to permit a reasoned choice of alternatives so far as environmental aspects are concerned; the agency has failed to disclose accurate information pertaining to numerous businesses, food sources, green spaces, waterways, and community resources that exist in the area of disturbance, but are not represented in the Environmental Assessment.
939	I travel the kingwood pike almost daily and there can be some traffic delays. With that being said the roundabout project makes no sense in multiple ways. The cost of this project is absurd when there is supposedly no money to fix the current roads, for example, there is a slip only a quarter mile up the kingwood pike that has been patched multiple times over many years, but there's never enough money to properly fix it. I live on a small back road and if it wasn't for the people that live on this road maintaining it, we would have trouble getting in and out of our homes. The proposed detour route is not suitable. At best it is a one and a half lane road only suitable for cars. There is no way large trucks and tractor and trailers can use Aarons Creek Road every day for the amount of time it will take to complete this project. The multiple acres of private land that would need to be taken is ridiculous and will ruin the property value of many people's propriety, I understand that Morgantown is growing and the infrastructure needs to be improved, but this project is not what the people that live and travel this area want this is a project that the county commission wants. They will do anything to try and keep large trucks out of downtown Morgantown and this will not help that at all. The county commission only cares about the town and are in no way in touch with what the rural areas of the county want and need. I am in no way against improvement I feel that adding turning lanes is a better solution to the traffic delays in this location and would cause less inconvenience to the people that travel this area and would be much more economical to the taxpayer.
940	I would like the department to find an alternative to the proposed roundabout that will preserve the community garden. I signed a petition that I support that is described as such, "This petition is to gather support for an alternative option to the Greenbag Road Improvement Project. We call this: Option G It is a Community Based Solution to the existing alternatives. The option preferred by ALL PARTIES, as listed below, combines dedicated left turn lanes for Greenbag Road (as in Option D) with the design features, but no added lanes for Dorsey Avenue and Kingwood Pike described in the Executive Summary of the EA. These design features include widening traffic lanes, adding sidewalks on Dorsey Avenue, and adding a paved shoulder on Kingwood Pike. This new option would have numerous benefits. It would: Improve the safety and access for motorized and non-motorized connections;

	Reduce impacts to natural resources; Preserve significantly more of the adjacent farmland of statewide importance; Reduce the amount of impervious surface, causing fewer impacts to nearby streams and wetlands; Limit disturbance to unsuitable soils with a history of slips to prevent likelihood of property damage or loss; Limit impacts to existing residences and businesses on Dorsey Avenue and Kingwood Pike and account for additional historic and cultural preservation; Reduce construction costs. The Concerned Parties and Interested Parties (The Landowners) , as listed below, unanimously support this “Option G ‘ as “preferred” " I believe the community garden to be a very important part of Morgantown even though it is located outside the city limits. The garden provides a source of community and is often worked by volunteers from the friendship house, whose patrons are largely drawn from the homeless population of Morgantown. By working in the garden the patrons of the friendship house are able to feel self worth and expend their labor into something that is productive and beneficial to our community. Regards - Nicholas Stamm
941	Two roundabouts are definitely not needed or wanted here. Turning lanes are only needed during peak hours for about a 20 minute time period. I support the no build option.
942	The Morgantown Pedestrian Safety Board would like to thank the WVDOH for the many infrastructure improvements that have been completed in and around Monongahela County. We appreciate the open public forum to consider plans for new projects. We are aware that many proposals have recently been developed, and we share your vision to improve safety and efficiency within our transportation system. We would like to offer input to the non-motorized transportation accommodations within the designs for Greenbag Road. There is great opportunity to provide residents with walking and biking alternatives to access schools and businesses. Our suggestions will lead to reduced motorized vehicular traffic and congestion in this key corridor. Please consider these recommendations to provide safe access between the residential complexes, schools and commercial enterprises such as the Giant Eagle grocery store, Goodyear Auto, Center City Auto Body, and Mountaineer Mall complex: -pedestrian crosswalks (1) near the Mountaineer Mall, (2) adjacent to the Roundabout, and (3) other key crossings -a multi-use path with buffer along the entirety of the Greenbag Road to allow safe walking and biking -a multi-use path or sidewalk along Mississippi Street
943	My husband is a CDL driver. He is very upset about the round about idea. It will not work in the best interest of the truck drivers or the public. He can only drive on the round about if he is driving a small 28 foot trailer, yet still avoids roundabouts at all cost, He can not drive on them at all if he is driving a 45, 48, or 53 foot trailer which is what he generally is driving. Please drop this destructive, intrusion, disaster of an idea. Please leave Green Bag Rd. alone. Thank you.
944	I am a resident of Zinn Chapel Rd off of the Kingwood Pike in Preston Co. My husband and I both travel the Kingwood Pike to the city of Morgantown for work daily and have for 13 years. I have traveled through the intersection of Dorsey Avenue/Kingwood Pike at peak times for a long time and never felt the intersection needed more than left turning lanes. One of the DOH’s claims of necessity for these proposed roundabouts are to divert trucks away from downtown Morgantown. I have been told for years that the trucks take the downtown route as opposed to Greenbag road for two reasons: 1. It’s shorter which equals less road tax that they pay and 2. They avoid the curved steep hill at

	the intersection of Greenbag Rd and Don Knotts Blvd. So the impression I have been given is that the trucks will not utilize Greenbag Rd whether or not there are 2 roundabouts that are going to cost MILLIONS of dollars. Furthermore, how can the WVDOH justify millions of dollars for this project where traffic is slightly congested a few times a day when we have hundreds of other roads in North Central WV in dire need of paving, some that are slipping over hillsides, including the Kingwood Pike????
945	Unfortunately, the assessment does not prove the need for this project.
946	how will you guys address light pollution? This is the most beautifully dark area of Morgantown, it would be a shame for a bunch of streetlights. For humans and wildlife. How will you address this for minimal impact?
947	Y'all are gonna take Garrett Richards land?!?!?!! The old Anderson farm? The apple farm? Tommy Richards? Shame on you!
948	How do you sleep at night? No One Wants This! Why are you disregarding the public?
949	Keep Morgantown green! Put in a left turn lane. A roundabout? Idiots!
950	How dare you guys destroy Morgantown's only hemp farm. A small business. During these times. Atrocious
951	What state do you think this is? This is West Virginia. WILD AND WONDERFUL. How can we be wild and wonderful if you keep tearing down all the trees taking peoples farm land houses and animals who live there? This ain't philly!! Leave our people alone
952	Bowles Rice LLP represents Mary Hastings, one of several principals of Joy and Hemp Universal LLC and owner of land situate in Monongalia County, West Virginia, at the corner of Greenbag Road and the Kingwood Pike, described for reference as Tax Map Parcel 9-48A-11 (the "Hastings Property"). The Greenbag Road Improvement Project (the "Project"), referenced above, intends to widen roads and shoulders and install roundabouts. Said Project appears to, according to the presently proposed boundary of disturbance, require the condemnation of the entirety of the Hastings Property. You have been notified by Ms. Hastings and others whose property interests will be taken by this unnecessary and broadly-tailored project, through public comment and otherwise, of the myriad of procedural deficiencies and resulting inaccuracies in and inherent to the Environmental Assessment and other Project reviews, documents, and institutional commentary. We urge you to address these deficiencies and correct these inaccuracies before the Projects moves any further, the failure of which will result in significant and unnecessary, further delay. We write today regarding one specific inaccuracy that has pervaded Project documents and statements made by the Monongalia County Commission and others — the representation that no business will be affected by the Project. To the contrary, the Hastings Property is the primary operations site for Joy and Hemp Universal LLC; its hemp product is grown 100% thereon. If the Project proceeds as planned, Joy and Hemp will be forced to close its business. It is unclear why Project documents and those contributing to them continue to represent that no business will be affected by the Project. It certainly appears as if those involved simply do not value and respect this particular West Virginia small business. Yet, it has also been suggested that hemp operations simply move to other land owned not by Ms. Hastings, but other land owned by Ms. Hastings' relatives. For many reasons, this is not a viable solution. While incredulous that Project leaders and administrators are unaware of the significant impact the Project will have on Joy and Hemp Universal LLC*, we hope that any factual inaccuracies concerning the impact on Joy and Hemp are borne of misunderstanding or a lack of knowledge. In that regard, please let us know if any documentation from Joy and Hemp is required to illustrate its interest in this Project.

	We thank you all for your efforts. Note* The State of West Virginia, by and through the Monongalia County Prosecuting Attorney's Office, recently obtained a favorable restitution award for Joy and Hemp through the prosecution of an individual for larceny of hemp from the Hastings Property.
953	It is not appropriate to disregard alternatives merely because they do not offer a complete solution to the problem. - US Courts via NEPA
954	The Greer limestone trucks are private contracting truckers will take the fastest and most fuel efficient route, always. The Greenbag Road, with widening and new intersections, will be neither faster, nor more fuel efficient than their existing route through downtown Morgantown. City officials should be made aware.
955	Thank you for extending the comment period for the Morgantown Greenbag Road project. Our family has lived in the First Ward neighborhood, which is next to Greenbag Road, for 29 years. My husband and I use the road as we travel to work and to the grocery store. While we notice more traffic during the parts of the day that work and school begin and end, it has never been a terrible inconvenience to travel this route. Rather than constructing a roundabout, I believe that left turn lanes (and arrows) would work nicely. It seems a shame to cause a hardship on the local farmers near the Kingwood Pike intersection if the traffic flow can be improved without using their land.
956	In a recent conversation I had with a local Civil Engineer with road design experience, he indicated that roundabouts generally work best where all 4 directions of an intersection have about the same amount of traffic. That's really not the case at either of the 2 proposed Green Bag Rd roundabouts. In addition to the over 1100 residents who signed a petition in Nov OPPOSING these roundabouts, the lack of balanced traffic at these intersections is another reason to pursue a different solution for this road, e.g. left turning lanes.
957	The WVDOH, and/or other parties vested in the proposed Greenbag Road/Kingwood Pike roundabout, has not compellingly demonstrated the need for construction of a roundabout at the proposed location. The WVDOH has not effectively and definitively demonstrated that the proposed roundabout will solve any actual defined problem. In short, the WVDOH has not justified the expenditure of public monies that can be more justifiably and reasonably be utilized for other more worthy public works projects in Monongalia County. I am always in principle inclined against •development for development's sake•. The proposed roundabout is an expensive solution in search of an actual real world problem. In my opinion, the proposed roundabout does not represent a responsible expenditure of public funds and, in this regard, the rationale for this project does not justify public taking of private lands required for completion of the project scope of work. For these and other reasons, I urge the WVDOH to explore and identify viable (and much less expensive) alternatives to the roundabout project proposed for the Greenbag Road and Kingwood Pike intersection.
958	Letter submitted to M. Dean: I am writing to you today in response to a couple of articles you have published regarding the Greenbag Road roundabout. There has been some public awareness about the potential loss of the Hastings farmland where the proposed roundabout would be located. There is more to this proposed destruction, of local interest, that has not been publicized. I live at 27 Kingwood Pike, in a brick home that overlooks the intersection of Dorsey, Greenbag, and Kingwood Pike. To Morgantown natives who have lived here over the last 100 years, they may know it as the Anderson Farmhouse. The farm itself covers 75 acres, and has frontage along Kingwood Pike, Greenbag Road, and Aaron's Creek Road. My Great, Great, Grandfather purchased the farm in 1900, as an addition to his farm that occupied where the Kennedy Federal Correction facility now exists. His son, and my Great Grandfather, JD Anderson, built his own house and farm buildings around 1920, and now a century later, my young children are the sixth generation to live and experience agriculture on our farm. My Great Grandfather was involved with agriculture and the community on a local and national level. Some of his contributions and achievements include - one of the first pipeline milkers in the state, which was the new and efficient way to milk cattle; farm produce and goods sold to Hotel Morgan

	in the 1930s; Co-founder of Sanitary Ice Cream, which provided dairy goods around Morgantown in the early 1900s (still advertised on the wall at Mario's Fishbowl on Richwood Avenue; member of the Mon General Hospital Board, and the namesake of Mon General's main road; inductee of the WV Ag Hall of fame; served as one of 13 appointee in 1953 by President Eisenhower on the first board for Congressional Farm Credit Act, which developed policies to get American farmers needed loans. Due to unsuitable soil conditions for road building at inception in the 1960's, all structures of the farm were condemned and razed, with the exception of the home. Now with more proposed destabilization of soils and high cut walls on Greenbag Road and Kingwood Pike, our historical home is at risk, and the State may finish the destructive path they started. As for the roundabout itself, another option needs to be taken into consideration as the leading alternative for the roundabout at the Kingwood Pike and Greenbag Road intersection. Neither the WVDOH, nor MMMPO seem to want to acknowledge the best solution to current and future traffic flow in that area. It's irresponsible to ignore the large amount of public responses from WVDOH's public presentation, that has been overwhelmingly against the roundabout option. Improved vehicle traffic flow and pedestrian accessibility can still be achieved without a roundabout. Left turning lanes only on Greenbag, with arrows allowing protected turns onto Dorsey Avenue and Kingwood Pike would be efficient. Dorsey Avenue and Kingwood Pike do not need added lanes to address traffic flow, which in turn reduce construction costs, reduce property acquisition costs, and do not displace any residences. Roundabouts can be cost effective, when it is new construction, or large public right of ways, but this is not the case here. In fact, the roundabout could end up being more dangerous for pedestrian traffic to cross avenues, as drivers may not need to yield, or look in both directions as they enter. Traffic congestion peaks during school dismissal and the typical morning and 5 o'clock rush, but otherwise flows efficiently. What parts of town don't have the same peak use, yet operate sufficiently without a roundabout?! A professional independent traffic study in 2015 counted only 6% of traffic during peak hours as trucks. Wasting time and money on the roundabout will not alleviate traffic patterns through downtown; the latter is simply the shortest, easiest route for trucks. The Greenbag corridor is fairly developed already and to say that the roundabout is necessary to accommodate future traffic levels, that couldn't be remedied by turning lanes, is a misrepresentation. Eliminating a single stop light, which has been represented by MMMPO as a two minute savings is not a make it or break it scenario for any driver. Adding two roundabouts on Greenbag would likely increase commute times during non-peak hours, because traffic will be forced to drastically slow down on the approach and exit. The likelihood of the roundabout and its support from the aforementioned organizations, along with our County Commission is simple. Its low hanging fruit, and officials can say "Look at these road improvements we made" without having to quarrel with Charleston and District 4 over funds and priorities, while the real congestion and degradation of roads in our county continue. That, along with the facts that the number of property owners impacted are few and the public may be indifferent on the matter, are a good look. Am I personally vested in objecting to the construction? Yes. At worst I am at risk of losing my historic home, and at best, I will have a large, obscene roundabout less than 100 ft. outside my door. Is there a better alternative to what's been proposed? Yes. A group of property owners who stand to lose the most, have sent a joint letter in favor of turning lanes on Greenbag, to WVDOH engineers in Charleston. Hopefully the community will voice their support for this alternative, and help these farms that combined, have supported the community for almost a quarter millennium. The public comment period has been extended through the end of November. For anyone who passes through that area, that might say that their commute needs to be faster, realize that it's not nearly as bad as other parts of town, it's probably why you chose the route to begin with. It's certainly not as scenic as other parts of town. When you pass by, enjoy some of Morgantown's history, greenspace, and agriculture while it's still here.
959	I am writing to oppose the roundabout for the above intersection. Two different letters to the Dominion Post express my sentiments precisely. The second was titled "Fund real road repairs, not pet projects" and appeared in the Dec. 20, 2020 edition. It was the featured letter to the editor and criticized spending millions on this project. while roads in our state are either crumbling or in dire need of repair (giving a

	number of specific locations). When we moved to Morgantown in 1977, I saw how deplorable the roads not only in Monongalia County were, but across the state. We voted for repairing these roads not that long ago, and we were promised we would see improvements. Not much has improved. We still have to dodge potholes or rough pavement whenever we venture to go anywhere. David Ervin wrote the letter just cited and should be praised for citing his opinion. The first letter was titled "Proposed roundabout threatens historic home" and appeared in the Dec. 6, 2020 edition of the Dominion Post. Again, it was the featured letter to the editor and was again given the prominent position on the Opinion page C-1. It asked people to contact you and complain. I agree with Garrett Richards in his cry for reason about this project.

Table 3: Response to Comments

Comment Number	Comment Response
1	The simulation referenced here is the WVDOH video introduction to roundabouts and does not represent the design for either of the Greenbag Road proposed roundabouts.
2	We appreciate your input regarding the project.
3	Thank you for providing a response to our survey question regarding how you learned about the virtual public meeting.
4	We appreciate your input regarding the project, however please refer to the EA for additional detail on the need for the preferred alignment. The EA reviewed multiple alternatives including turn lanes, traffic lights, and the roundabouts. Through the analysis in the EA, the only alternative that meets the purpose and need of the project is the roundabout.
5	Both the MMMPO corridor study and the 2018 traffic study determined that traffic flow through the corridor is controlled by the congestion at the major intersections in the corridor. The projected growth in the Morgantown area will continue to increase traffic and congestion at the intersections if improvements do not occur. One of the major differences between Greenbag Road and the Mileground, is the volume of traffic. Greenbag Road has less than half the traffic volume that Mileground has. A second major difference is the general configuration of the roundabouts. The proposed roundabouts on Greenbag are more straightforward and more traditional roundabout designs, without all of the confusing lanes that are present at Mileground. The roundabouts on Greenbag Road will be more intuitive for drivers. Road repair beyond the scope of this project is being addressed through the Governor's Roads to Prosperity program and progress can be tracked via the WVDOH website. Conscious Harvest Cooperative Community Garden, Joy and Hemp Universal LLC, and Mockingbird Hill Farms are located on private property and the property owner will be compensated for the sale of any land to the WVDOH during the right-of-way acquisition process. Impacts to this parcel have been minimized to the extent practicable. Approximately 1.56 acres (67,900 square feet) will be required from the parcel. Fair market value will be paid for all properties that require full or partial acquisition as a result of the project. When only part of the property is required, as is the case with this parcel, fair market value of the part taken will be paid, plus damages, if any, to the residue, less all benefits. West Virginia law defines “market value” as the price a willing buyer would pay a willing seller, neither acting under compulsion nor duress, both exercising prudence and intelligent judgment as to its value and familiar with the purpose for which the property is reasonably available. Fair market value will be determined by a competent, professional real estate appraiser after a thorough inspection of the property, a comparison with similar properties in the area that have been sold recently, a determination and consideration of its replacement cost and depreciation and consideration of the income-producing potential. All appraisal reports are office-reviewed, then rechecked in the field by experienced, qualified review appraisers for accuracy. Since the Division of Highways has adopted a firm price policy, the property owner will be offered the full

	amount of the approved appraisal. There will be no attempt to buy property at less than fair market value. This policy guarantees that all citizens of the state receive full value for the money expended for highway rights of way. Those who hold a valid property interest in the property that is acquired for the project will be compensated during the ROW acquisition phase.
6	The online commenting period was available beginning on September 29 and ending on November 30, 2020.
7	Thank you for providing a response to our survey question regarding how you learned about the virtual public meeting.
8	All comments received via the online system are included as part of this project record. This comment was provided prior to the public meeting on September 29, 2020.
9	The turn lane options that were examined do not improve the level of service as much as the roundabout and the turn lanes at Dorsey Avenue/Kingwood Pike involve complete takes of 2 residences and 1 business. These takes are different from what was reported in the EA. This change will be noted in the FONSI. The roundabouts have been designed with larger vehicles in mind and incorporate truck aprons designed to support the weight and turning radius of larger vehicles, including school buses. Adding only left turn lanes on Greenbag Road at the Dorsey/Kingwood Pike intersection was evaluated during an initial round of traffic analysis because this option had been suggested by the MPO. The option included upgrading the signal lights to have a protected/permissive left turn phase. The analysis showed that this option would result in some intersection improvements but could not achieve LOS C or better for the overall intersection operation. The overall intersection would operate at an unacceptable LOS (LOS E or F). The eastbound Greenbag Road traffic queue would extend past the Bluegrass Village Driveway. Based on these findings this option was replaced with Options D and E for the EA analysis.
10	We appreciate your input regarding the project.

The analysis showed that this option would result in some intersection improvements but could not achieve LOS C or better for the overall intersection operation. The overall intersection would operate at an unacceptable LOS (LOS E or F). The eastbound Greenbag Road traffic queue would extend past the Bluegrass Village Driveway. Based on these findings this option was replaced with Options D and E for the EA analysis. A traffic study was completed in 2018 to determine the current conditions and provide data for estimates of future conditions. The study showed that the current level of service for the Dorsey Avenue/Kingwood Pike intersection to be C in both morning and evening and for Mississippi Street a C in the morning and an A in the evening. The study used a forecasted growth rate of 1.16% per year provided by the MMMPO to create projections for the design year (2048) levels of service. Forecasted 2048 level of service for the Dorsey Avenue/Kingwood Pike intersection is C in morning and F in evening and for Mississippi Street an F in the morning and a D in the evening indicating that as the Morgantown area continues to grow the traffic congestion at these intersections will increase as well. Increased congestion leads to longer travel times and more opportunities for safety incidents and serious injuries.

29	The turn lane options that were examined do not improve the level of service as much as the roundabout and the turn lanes at Dorsey Avenue/Kingwood Pike involve complete takes of 2 residences and 1 business. These takes are different from what was reported in the EA. This change will be noted in the FONSI. The roundabouts have been designed with larger vehicles in mind and incorporate truck aprons designed to support the weight and turning radius of larger vehicles, including school buses. Adding only left turn lanes on Greenbag Road at the Dorsey/Kingwood Pike intersection was evaluated during an initial round of traffic analysis because this option had been suggested by the MPO. The option included upgrading the signal lights to have a protected/permissive left turn phase. The analysis showed that this option would result in some intersection improvements but could not achieve LOS C or better for the overall intersection operation. The overall intersection would operate at an unacceptable LOS (LOS E or F). The eastbound Greenbag Road traffic queue would extend past the Bluegrass Village Driveway. Based on these findings this option was replaced with Options D and E for the EA analysis. Roundabouts help reduce the likelihood and severity of collisions. Studies by the Federal Highway Administration (FHWA) have shown that roundabouts typically achieve reduction in overall collisions, injury collisions, fatality collisions, and pedestrian collisions. Reasons for these reductions due to the installation of a roundabout include: Low travel speeds – Drivers must slow down and yield to traffic before entering a roundabout. The reduction in speeds results in a decrease in crash severity and injury. No traffic light “to beat” – The design of a roundabout promotes a continuous circular flow of traffic. Because of this design, drivers will not have the incentive to speed up to “beat the light”, like they may at a traditional intersection. One way travel – The design of a roundabout directs drivers through gently designed curves into a one-way counterclockwise circular path. This design eliminates the possibilities for T-bone and head-on collisions. In addition, a conventional 4-way intersection has 32 points of vehicle conflict due to the different maneuvers through the intersection. A roundabout has 8 points of conflict, which all occur in the same direction, reducing crash severity and likelihood of injury.

	Conscious Harvest Cooperative Community Garden, Joy and Hemp Universal LLC, and Mockingbird Hill Farms are located on private property and the property owner will be compensated for the sale of any land to the WVDOH during the right-of-way acquisition process. Impacts to this parcel have been minimized to the extent practicable. Approximately 1.56 acres (67,900 square feet) will be required from the parcel. Fair market value will be paid for all properties that require full or partial acquisition as a result of the project. When only part of the property is required, as is the case with this parcel, fair market value of the part taken will be paid, plus damages, if any, to the residue, less all benefits. West Virginia law defines "market value" as the price a willing buyer would pay a willing seller, neither acting under compulsion nor duress, both exercising prudence and intelligent judgment as to its value and familiar with the purpose for which the property is reasonably available. Fair market value will be determined by a competent, professional real estate appraiser after a thorough inspection of the property, a comparison with similar properties in the area that have been sold recently, a determination and consideration of its replacement cost and depreciation and consideration of the income-producing potential. All appraisal reports are office-reviewed, then rechecked in the field by experienced, qualified review appraisers for accuracy. Since the Division of Highways has adopted a firm price policy, the property owner will be offered the full amount of the approved appraisal. There will be no attempt to buy property at less than fair market value. This policy guarantees that all citizens of the state receive full value for the money expended for highway rights of way. Those who hold a valid property interest in the property that is acquired for the project will be compensated during the ROW acquisition phase.
30	Please refer to the EA which evaluates the potential impacts of multiple alternatives on the surrounding area and recommends the preferred alternative as meeting the purpose and need.
31	The preliminary investigation and engineering traffic study was completed to evaluate the Greenbag Road corridor, evaluating the existing and potential future operation of the intersections selected for study by WVDOH. The evaluation of existing roadway conditions, including the existing roadway conditions of Kingwood Pike, was not part of the preliminary investigation and engineering traffic study. The Greenbag Road corridor has long been recognized as a challenging roadway to navigate due to geometric deficiencies, significant intersection delays during the peak hours, and increased volume of truck traffic and development within the corridor. Several studies have been previously completed through the MMMPO, evaluating various transportation plans for the Greenbag Road corridor, with the ultimate vision of transforming Greenbag Road into a safe, efficient, and attractive multimodal transportation facility. It should be noted that the traffic evaluation was completed prior to the COVID-19 pandemic and its effects to traffic currently occurring. The turn lane options that were examined do not improve the level of service as much as the roundabout and the turn lanes at Dorsey Avenue/Kingwood Pike involve complete takes of 2 residences and 1 business. These takes are different from what was reported in the EA. This change will be noted in the FONSI. Adding only left turn lanes on Greenbag Road at the Dorsey/Kingwood Pike intersection was evaluated during an initial round of traffic analysis because this option had been suggested by the MPO. The option included upgrading the traffic signal to provide a protected/permissive left turn phase on Greenbag Road. The analysis showed that this option would result in some intersection improvements but could not achieve LOS C or better for the overall intersection operation. It should be noted that LOS C is WVDOH's design year level of service criteria threshold for intersection improvements. The overall intersection would operate at an unacceptable LOS (LOS E). In addition, the left turn lane option would result in the eastbound Greenbag Road traffic queue to extend past the Bluegrass Village Driveway.

	Roundabouts help reduce the likelihood and severity of collisions. Studies by the Federal Highway Administration (FHWA) have shown that roundabouts typically achieve reduction in overall collisions, injury collisions, fatality collisions, and pedestrian collisions. Reasons for these reductions due to the installation of a roundabout include: - Low travel speeds – Drivers must slow down and yield to traffic before entering a roundabout. The reduction in speeds results in a decrease in crash severity and injury. - No traffic light "to beat" – The design of a roundabout promotes a continuous circular flow of traffic. Because of this design, drivers will not have the incentive to speed up to "beat the light", like they may at a traditional intersection. - One way travel – The design of a roundabout directs drivers through gently designed curves into a one-way counterclockwise circular path. This design eliminates the possibilities for T-bone and head-on collisions. In addition, a conventional 4-way intersection has 32 points of vehicle conflict due to the different vehicular maneuvers through the intersection. A roundabout has 8 points of conflict, which all occur in the same direction, reducing crash severity and likelihood of injury. Lastly, the traffic control plan, which will outline the intended traffic detour tour, will continue to be revised during final design. It should be noted that Aaron's Creek Road will not be utilizes as a signed detour. The anticipated plan intends to utilize the center of the Dorsey/Kingwood roundabout as a temporary intersection with temporary traffic signals during construction. A short-term detour is proposed using Summers School Road while constructing the connection of the existing Kingwood Pike with the new portion. Conscious Harvest Cooperative Community Garden, Joy and Hemp Universal LLC, and Mockingbird Hill Farms are located on private property and the property owner will be compensated for the sale of any land to the WVDOH during the right-of-way acquisition process. Impacts to this parcel have been minimized to the extent practicable. Approximately 1.56 acres (67,900 square feet) will be required from the parcel. Fair market value will be paid for all properties that require full or partial acquisition as a result of the project. When only part of the property is required, as is the case with this parcel, fair market value of the part taken will be paid, plus damages, if any, to the residue, less all benefits. West Virginia law defines "market value" as the price a willing buyer would pay a willing seller, neither acting under compulsion nor duress, both exercising prudence and intelligent judgment as to its value and familiar with the purpose for which the property is reasonably available. Fair market value will be determined by a competent, professional real estate appraiser after a thorough inspection of the property, a comparison with similar properties in the area that have been sold recently, a determination and consideration of its replacement cost and depreciation and consideration of the income-producing potential. All appraisal reports are office-reviewed, then rechecked in the field by experienced, qualified review appraisers for accuracy. Since the Division of Highways has adopted a firm price policy, the property owner will be offered the full amount of the approved appraisal. There will be no attempt to buy property at less than fair market value. This policy guarantees that all citizens of the state receive full value for the money expended for highway rights of way. Those who hold a valid property interest in the property that is acquired for the project will be compensated during the ROW acquisition phase.

40	The turn lane options that were examined do not improve the level of service as much as the roundabout and the turn lanes at Dorsey Avenue/Kingwood Pike involve complete takes of 2 residences and 1 business. These takes are different from what was reported in the EA. This change will be noted in the FONSI. The roundabouts have been designed with larger vehicles in mind and incorporate truck aprons designed to support the weight and turning radius of larger vehicles, including school buses. Adding only left turn lanes on Greenbag Road at the Dorsey/Kingwood Pike intersection was evaluated during an initial round of traffic analysis because this option had been suggested by the MPO. The option included upgrading the signal lights to have a protected/permissive left turn phase. The analysis showed that this option would result in some intersection improvements but could not achieve LOS C or better for the overall intersection operation. The overall intersection would operate at an unacceptable LOS (LOS E or F). The eastbound Greenbag Road traffic queue would extend past the Bluegrass Village Driveway. Based on these findings this option was replaced with Options D and E for the EA analysis. The EA reviewed multiple alternatives including turn lanes, traffic lights, and the roundabouts. Through the analysis in the EA, the only alternative that meets the purpose and need of the project is the roundabout. Conscious Harvest Cooperative Community Garden, Joy and Hemp Universal LLC, and Mockingbird Hill Farms are located on private property and the property owner will be compensated for the sale of any land to the WVDOH during the right-of-way acquisition process. Impacts to this parcel have been minimized to the extent practicable. Approximately 1.56 acres (67,900 square feet) will be required from the parcel. Fair market value will be paid for all properties that require full or partial acquisition as a result of the project. When only part of the property is required, as is the case with this parcel, fair market value of the part taken will be paid, plus damages, if any, to the residue, less all benefits. West Virginia law defines “market value” as the price a willing buyer would pay a willing seller, neither acting under compulsion nor duress, both exercising prudence and intelligent judgment as to its value and familiar with the purpose for which the property is reasonably available. Fair market value will be determined by a competent, professional real estate appraiser after a thorough inspection of the property, a comparison

	with similar properties in the area that have been sold recently, a determination and consideration of its replacement cost and depreciation and consideration of the income-producing potential. All appraisal reports are office-reviewed, then rechecked in the field by experienced, qualified review appraisers for accuracy. Since the Division of Highways has adopted a firm price policy, the property owner will be offered the full amount of the approved appraisal. There will be no attempt to buy property at less than fair market value. This policy guarantees that all citizens of the state receive full value for the money expended for highway rights of way. Those who hold a valid property interest in the property that is acquired for the project will be compensated during the ROW acquisition phase.
41	Thank you for providing a response to our survey question regarding how you learned about the virtual public meeting.
42	The preliminary investigation and engineering traffic study has examined two build alternatives and three options for each of the major intersections. The intersection options that were evaluated and analyzed include turning lanes, traffic signals, and roundabouts. WVDOH requires intersection improvements to meet or exceed an overall intersection LOS C or better during the peak hours studied for design year improvements. The times of day (peak hours) selected to be studied followed WVDOH guidelines and is standard traffic engineering practice for determining future intersection improvements. At the intersection of Greenbag Road/Dorsey Avenue/Kingwood Pike the traffic analysis determined that the intersection would operate at failure (overall intersection LOS F) if existing intersection conditions and operations were to remain the same 30-years in the future (design year) without any improvements. Adding only left turn lanes on Greenbag Road at the Dorsey/Kingwood Pike intersection was evaluated during an initial round of traffic analysis because this option had been suggested by the MPO. The option included upgrading the signal lights to have a protected/permissive left turn phase. The analysis showed that this option would result in some intersection improvements but could not achieve LOS C or better for the overall intersection operation. The overall intersection would operate at an unacceptable LOS (LOS E). In addition, the left turn lane option would result in the eastbound Greenbag Road traffic queue to extend past the Bluegrass Village Driveway. The traffic analysis determined that with installation of a roundabout the overall intersection would operate at a LOS C, meeting WVDOH design year criteria. At the intersection of Greenbag Road/Mississippi Avenue the traffic analysis determined that the intersection would operate at failure (overall intersection LOS F) if existing intersection conditions and operations were to remain the same 30-years in the future (design year) without any improvements. The design year with improvements scenarios evaluated determined that with installation of a roundabout the overall intersection would operate at a LOS A, best operating conditions, for all peak hours studied. Installation of a traffic signal with turn lanes resulted in an overall intersection LOS B during the AM peak hour, with the Mississippi Avenue approach operating at a LOS C. Though the analysis meets WVDOH minimum LOS criteria, the roundabout option exceeds WVDOH minimum LOS criteria. Roundabouts help reduce vehicular delay and promotes a continuous flow of traffic, which increases traffic capacity at an intersection. The roundabouts have been designed with larger vehicles in mind and incorporate truck aprons to support the weight and turning radius of larger vehicles, including school buses. In addition, roundabouts help reduce the likelihood and severity of collisions. Studies by the Federal

	Highway Administration (FHWA) have shown that roundabouts typically achieve reduction in overall collisions, injury collisions, fatality collisions, and pedestrian collisions. Reasons for these reductions due to the installation of a roundabout include: - Low travel speeds – Drivers must slow down and yield to traffic before entering a roundabout. The reduction in speeds results in a decrease in crash severity and injury. - No traffic light "to beat" – The design of a roundabout promotes a continuous circular flow of traffic. Because of this design, drivers will not have the incentive to speed up to "beat the light", like they may at a traditional intersection. - One way travel – The design of a roundabout directs drivers through gently designed curves into a one-way counterclockwise circular path. This design eliminates the possibilities for T-bone and head-on collisions. In addition, a conventional 4-way intersection has 32 points of vehicle conflict due to the different crossings and maneuvers through the intersection. A roundabout has 8 points of conflict, which all occur in the same direction, reducing crash severity and likelihood of injury. Lastly, long-term costs associated with roundabouts are significantly less than a traffic signal, since no electrical costs and no traffic signal maintenance costs are involved with a roundabout.
43	The turn lane options that were examined do not improve the level of service as much as the roundabout and the turn lanes at Dorsey Avenue/Kingwood Pike involve complete takes of 2 residences and 1 business. These takes are different from what was reported in the EA. This change will be noted in the FONSI. The roundabouts have been designed with larger vehicles in mind and incorporate truck aprons designed to support the weight and turning radius of larger vehicles, including school buses. Adding only left turn lanes on Greenbag Road at the Dorsey/Kingwood Pike intersection was evaluated during an initial round of traffic analysis because this option had been suggested by the MPO. The option included upgrading the signal lights to have a protected/permissive left turn phase. The analysis showed that this option would result in some intersection improvements but could not achieve LOS C or better for the overall intersection operation. The overall intersection would operate at an unacceptable LOS (LOS E or F). The eastbound Greenbag Road traffic queue would extend past the Bluegrass Village Driveway. Based on these findings this option was replaced with Options D and E for the EA analysis.
44	Thank you for providing a response to our survey question regarding how you learned about the virtual public meeting.
45	Thank you for providing a response to our survey question regarding how you learned about the virtual public meeting.
46	The virtual meeting was advertised in the WV legal ads, on a message board in the project area, and through the Morgantown Monongalia MPO. Emails were sent to all commenters from the April 2019 meeting who had provided a valid email address and postcards were mailed to all commenters from the April 2019 meeting who had provided a complete mailing address.
47	Thank you for providing a response to our survey question regarding how you learned about the virtual public meeting.

48	Both the MMMPO corridor study and the 2018 traffic study determined that traffic flow through the corridor is controlled by the congestion at the major intersections in the corridor. The projected growth in the Morgantown area will continue to increase traffic and congestion at the intersections if improvements do not occur. The traffic study completed in 2018 determined the current conditions and provided data for estimates of future conditions. The study showed that the current level of service for the Dorsey Avenue/Kingwood Pike intersection to be C in both morning and evening and for Mississippi Street a C in the morning and an A in the evening. The study used a forecasted growth rate of 1.16% per year provided by the MMMPO to create projections for the design year (2048) levels of service. Forecasted 2048 level of service for the Dorsey Avenue/Kingwood Pike intersection is C in morning and F in evening and for Mississippi Street an F in the morning and a D in the evening indicating that as the Morgantown area continues to grow the traffic congestion at these intersections will increase as well. Increased congestion leads to longer travel times and more opportunities for safety incidents and serious injuries. The turn lane options that were examined do not improve the level of service as much as the roundabout and the turn lanes at Dorsey Avenue/Kingwood Pike involve complete takes of 2 residences and 1 business. These takes are different from what was reported in the EA. This change will be noted in the FONSI. Adding only left turn lanes on Greenbag Road at the Dorsey/Kingwood Pike intersection was evaluated during an initial round of traffic analysis because this option had been suggested by the MPO. The option included upgrading the signal lights to have a protected/permissive left turn phase. The analysis showed that this option would result in some intersection improvements but could not achieve LOS C or better for the overall intersection operation. The overall intersection would operate at an unacceptable LOS (LOS E or F). The eastbound Greenbag Road traffic queue would extend past the Bluegrass Village Driveway. Based on these findings this option was replaced with Options D and E for the EA analysis. The MMMPO had completed several previous studies evaluating various transportation plans for the Greenbag Road corridor, with the ultimate vision of transforming Greenbag Road into a safe, efficient, and attractive multimodal transportation facility. The scenarios determined to be evaluated in the traffic study evolved from the outcome of the MMMPO's preliminary studies and findings. Existing two-way stop controlled operations with potential roadway improvements were evaluated as part of the traffic study, as well as traffic signal and roundabout options. Roundabouts help reduce vehicular delay and promotes a continuous flow of traffic, which increases traffic capacity at an intersection. Traffic entering a roundabout on each approach does not need to have the same volume of traffic in order to function optimally. Each roundabout is designed and adapted to the context of its location. Roundabouts help reduce the likelihood and severity of collisions. Studies by the Federal Highway Administration (FHWA) have shown that roundabouts typically achieve reduction in overall collisions, injury collisions, fatality collisions, and pedestrian collisions. Reasons for these reductions due to the installation of a roundabout include: Low travel speeds – Drivers must slow down and yield to traffic before entering a roundabout. The reduction in speeds results in a decrease in crash severity and injury. No traffic light "to beat" – The design of a roundabout promotes a continuous circular flow of traffic. Because of this design, drivers will not have the incentive to speed up to "beat the light", like they may at a traditional intersection.

	One way travel – The design of a roundabout directs drivers through gently designed curves into a one-way counterclockwise circular path. This design eliminates the possibilities for T-bone and head-on collisions. In addition, a conventional 4-way intersection has 32 points of vehicle conflict due to the different maneuvers through the intersection. A roundabout has 8 points of conflict, which all occur in the same direction, reducing crash severity and likelihood of injury. The estimated construction cost for the Preferred Alternative with Intersection options C at Mississippi Street and F at Dorsey Avenue/Kingwood Pike is $10,429,195.49. Funding for the project will include both State and Federal highway funds. Road repair beyond the scope of this project is being addressed through the Governor's Roads to Prosperity program and progress can be tracked via the WVDOH website. The roundabouts were designed to accommodate AASHTO WB-62 truck configuration, which is an interstate semi-truck with a 62' wheel base between steer axle and last trailer axle, including a 48' trailer. Larger trucks can navigate the roundabout and use the internal truck apron. The traffic control plan will continue to be revised during final design, and will not use Aaron's Creek Road as a signed detour. The revised plan intends to utilize the center of the Dorsey/Kingwood roundabout as a temporary intersection with temporary traffic signals. A short-term detour is proposed using Summers School Road while constructing the connection of the existing Kingwood Pike with the new portion. The need for a sidewalk was identified by the public in the comments for the MMMPO corridor study as one of the factors to improve safety in the Greenbag Road corridor. Conscious Harvest Cooperative Community Garden, Joy and Hemp Universal LLC, and Mockingbird Hill Farms are located on private property and the property owner will be compensated for the sale of any land to the WVDOH during the right-of-way acquisition process. Impacts to this parcel have been minimized to the extent practicable. Approximately 1.56 acres (67,900 square feet) will be required from the parcel. Fair market value will be paid for all properties that require full or partial acquisition as a result of the project. When only part of the property is required, as is the case with this parcel, fair market value of the part taken will be paid, plus damages, if any, to the residue, less all benefits. West Virginia law defines "market value" as the price a willing buyer would pay a willing seller, neither acting under compulsion nor duress, both exercising prudence and intelligent judgment as to its value and familiar with the purpose for which the property is reasonably available. Fair market value will be determined by a competent, professional real estate appraiser after a thorough inspection of the property, a comparison with similar properties in the area that have been sold recently, a determination and consideration of its replacement cost and depreciation and consideration of the income-producing potential. All appraisal reports are office-reviewed, then rechecked in the field by experienced, qualified review appraisers for accuracy. Since the Division of Highways has adopted a firm price policy, the property owner will be offered the full amount of the approved appraisal. There will be no attempt to buy property at less than fair market value. This policy guarantees that all citizens of the state receive full value for the money expended for highway rights of way. Those who hold a valid property interest in the property that is acquired for the project will be compensated during the ROW acquisition phase.

49	This comment was addressed directly with the commenter during the public meeting.
50	Shifting the roundabout will not be feasible due to the proposed retaining wall and additional property acquisition. While permanent right-of-way will be required from this parcel, construction of the proposed project is not expected to notably affect operations or result in a total take / displacement of the property.
51	Conscious Harvest Cooperative Community Garden, Joy and Hemp Universal LLC, and Mockingbird Hill Farms are located on private property and the property owner will be compensated for the sale of any land to the WVDOH during the right-of-way acquisition process. Impacts to this parcel have been minimized to the extent practicable. Approximately 1.56 acres (67,900 square feet) will be required from the parcel. Fair market value will be paid for all properties that require full or partial acquisition as a result of the project. 52	One of the major differences between Greenbag Road and the Mileground, is the volume of traffic. Greenbag Road has less than half the traffic volume that Mileground has. A second major difference is the general configuration of the roundabouts. The proposed roundabouts on Greenbag are more straightforward and more traditional roundabout designs, without all of the confusing lanes that are present at Mileground. The roundabouts on Greenbag Road will be more intuitive for drivers. The property owner of the parcel near the proposed Greenbag Road/Dorsey Ave/Kingwood Pike intersection will be compensated for the sale of any land to the WVDOH during the right-of-way acquisition process. Impacts to this parcel have been minimized to the extent practicable. Approximately 1.56 acres (67,900 square feet) will be required from the parcel. Fair market value will be paid for all properties that require full or partial acquisition as a result of the project. When only part of the property is required, as is the case with this parcel, fair market value of the part taken will be paid, plus damages, if any, to the residue, less all benefits. Those who hold a valid property interest in the property that is acquired for the project will be compensated during the ROW acquisition phase.
60	The EA reported impacts to Federal Farmland Protection Policy Act (FPPA) soils. The entire Greenbag Road environmental study area is encompassed by "land already in or committed to urban development" as defined by the FPPA (see 7 CFR § 658.2 - Definitions) and is therefore not subject to provisions of FPPA. Please refer to the Farmland Appendix attached to the FONSI for further detail. LESA criteria are used under the FPPA. An FPPA review of the project shows that the entire project corridor is within land designated as urbanized area on the US Census Bureau Map and is considered land already in or committed to urban development by the act. Therefore, the Land Evaluation and Site Assessment is not applicable to this project. Conscious Harvest Cooperative Community Garden, Joy and Hemp Universal LLC, and Mockingbird Hill Farms are located on private property and the property owner will be compensated for the sale of any land to the WVDOH during the right-of-way acquisition process. Impacts to this parcel have been minimized to the extent practicable. Approximately 1.56 acres (67,900 square feet) will be required from the parcel. Fair market value will be paid for all properties that require full or partial acquisition as a result of the project. When only part of the property is required, as is the case with this parcel, fair market value of the part taken will be paid, plus damages, if any, to the residue, less all benefits. West Virginia law defines “market value” as the price a willing buyer would pay a willing seller, neither acting under compulsion nor duress, both exercising prudence and intelligent judgment as to its value and familiar with the purpose for which the property is reasonably available. Fair market value will be determined by a competent, professional real estate appraiser after a thorough inspection of the property, a comparison with similar properties in the area that have been sold recently, a determination and consideration of its replacement cost and depreciation and consideration of the income-producing potential. All appraisal reports are office-reviewed, then rechecked in the field by experienced, qualified review appraisers for accuracy. Since the Division of Highways has adopted a firm price policy, the property owner will be offered the full amount of the approved appraisal. There will be no attempt to buy property at less than fair market value. This policy guarantees that all citizens of the state receive full value for the money expended for highway rights of way. Those who hold a valid property interest in the property that is acquired for the project will be compensated during the ROW acquisition phase.
62	Conscious Harvest Cooperative Community Garden, Joy and Hemp Universal LLC, and Mockingbird Hill Farms are located on private property and the property owner will be compensated for the sale of any land to the WVDOH during the right-of-way acquisition process. Impacts to this parcel have been minimized to the extent practicable. Approximately 1.56 acres (67,900 square feet) will be required from the parcel. Fair market value will be paid for all properties that require full or partial acquisition as a result of the project. When only part of the property is required, as is the case with this parcel, fair market value of the part taken will be paid, plus damages, if any, to the residue, less all benefits. West Virginia law defines “market value” as the price a willing buyer would pay a willing seller, neither acting under compulsion nor duress, both exercising prudence and intelligent judgment as to its value and familiar with the purpose for which the property is reasonably available. Fair market value will be determined by a competent, professional real estate appraiser after a thorough inspection of the property, a comparison with similar properties in the area that have been sold recently, a determination and consideration of its replacement cost and depreciation and consideration of the income-producing potential. All appraisal reports are office-reviewed, then rechecked in the field by experienced, qualified review appraisers for accuracy. Since the Division of Highways has adopted a firm price policy, the property owner will be offered the full

	amount of the approved appraisal. There will be no attempt to buy property at less than fair market value. This policy guarantees that all citizens of the state receive full value for the money expended for highway rights of way. Those who hold a valid property interest in the property that is acquired for the project will be compensated during the ROW acquisition phase.
63	All roadway crossings will be marked and signed as crosswalks. Roundabouts are designed to slow speeds in the approach and through the roundabout allowing drivers more response time and limiting the number of potential directions where traffic could approach. Both of these factors improve safety for all drivers including older drivers as well as pedestrians and cyclists.
64	Conscious Harvest Cooperative Community Garden, Joy and Hemp Universal LLC, and Mockingbird Hill Farms are located on private property and the property owner will be compensated for the sale of any land to the WVDOH during the right-of-way acquisition process. 69	The MMMPO had completed several previous studies evaluating various transportation plans for the Greenbag Road corridor, with the ultimate vision of transforming Greenbag Road into a safe, efficient, and attractive multimodal transportation facility. The scenarios determined to be evaluated in the traffic study evolved from the outcome of the MMMPO’s preliminary studies and findings. Existing two-way stop controlled operations with potential roadway improvements were evaluated as part of the traffic, as well as traffic signal and roundabout options.
70	Conscious Harvest Cooperative Community Garden, Joy and Hemp Universal LLC, and Mockingbird Hill Farms are located on private property and the property owner will be compensated for the sale of any land to the WVDOH during the right-of-way acquisition process. Impacts to this parcel have been minimized to the extent practicable. Approximately 1.56 acres (67,900 square feet) will be required from the parcel. Those who hold a valid property interest in the property that is acquired for the project will be compensated during the ROW acquisition phase.
71	The traffic control plan will continue to be revised during final design, and will not use Aaron's Creek Road as a signed detour. The revised plan intends to utilize the center of the Dorsey/Kingwood roundabout as a temporary intersection with temporary traffic signals. A short-term detour is proposed using Summers School Road while constructing the connection of the existing Kingwood Pike with the new portion.
72	The existing grade on Kingwood Pike requires stopping on a -6.5% grade at the traffic signal. The grade approaching the roundabout includes a flat grade of less than 2% at the roundabout. In most cases, the roundabout will not require approaching traffic to come to a full or immediate stop, and does not queue traffic on the steep grade as the existing traffic signal does.
73	The noise analysis report indicates the Greenbag Road and intersection improvements for this alternative do not meet the requirements for either a Type I or Type II project. The Project is classified as a Type III project and a detailed noise analysis for highway traffic noise impacts was not required. The Type III noise analysis is available as an Appendix to the EA on the WVDOH website at https://transportation.wv.gov/highways/engineering/comment/closed/greenbagroadimprovementproject/Pages/default.aspx. The proposed project includes improvements to an existing transportation facility and the construction of the project is not expected to stimulate secondary growth, affect land use decisions, or induce land use change. Therefore, the project is not expected to result in light pollution impacts that are significantly worse than conditions currently present within the project area. The lighting layout for the roundabout will be developed during final design. The lighting will be designed to attempt to minimize light pollution while maintaining FHWA and WVDOH standards and requirements for lighting of the roundabout.
74	The noise analysis report indicates the Greenbag Road and intersection improvements for this alternative do not meet the requirements for either a Type I or Type II project. The lighting layout for the roundabout will be

	developed during final design. The lighting will be designed to attempt to minimize light pollution while maintaining FHWA and WVDOH standards and requirements for lighting of the roundabout.
75	The contractor will be responsible for obtaining a construction NPDES permit for the project. The permit will require the development and submittal of an erosion and sediment control plan, groundwater protection plan, and stormwater and pollution prevention plan to the WV Department of Environmental Protection.
76	Both the MMMPO corridor study and the 2018 traffic study determined that traffic flow through the corridor is controlled by the congestion at the major intersections in the corridor. The projected growth in the Morgantown area will continue to increase traffic and congestion at the intersections if improvements do not occur.
77	The FHWA approved the use of a virtual public meeting based on the public health concerns related to the COVID-19 pandemic.
78	The FHWA approved the use of a virtual public meeting based on the public health concerns related to the COVID-19 pandemic.
79	We appreciate your understanding during the transition to the virtual meeting format and apologize for any technical difficulties. Conscious Harvest Cooperative Community Garden, Joy and Hemp Universal LLC, and Mockingbird Hill Farms are located on private property and the property owner will be compensated for the sale of any land to the WVDOH during the right-of-way acquisition process. Impacts to this parcel have been minimized to the extent practicable. Approximately 1.56 acres (67,900 square feet) will be required from the parcel. 80	The MMMPO had completed several previous studies evaluating various transportation plans for the Greenbag Road corridor, with the ultimate vision of transforming Greenbag Road into a safe, efficient, and attractive multimodal transportation facility. The scenarios determined to be evaluated in the traffic study evolved from the outcome of the MMMPO’s preliminary studies and findings. Existing two-way stop controlled operations with potential roadway improvements were evaluated as part of the traffic, as well as traffic signal and roundabout options.

	The intersection of Greenbag Road/Dorsey Avenue/Kingwood Pike is currently controlled by a traffic signal and not by a four-way (all-way) stop, which includes stop sign control on each approach. The intersection would operate at failure (overall intersection LOS F) if existing intersection conditions and operations (traffic signal control) were to remain the same 30-years in the future (design year) without any improvements. Therefore, traffic analysis was not completed for a four-way (all-way) stop controlled intersection operations.
81	Both the MMMPO corridor study and the 2018 traffic study determined that traffic flow through the corridor is controlled by the congestion at the major intersections in the corridor. The projected growth in the Morgantown area will continue to increase traffic and congestion at the intersections if improvements do not occur.
82	Road repair beyond the scope of this project is being addressed through the Governor's Roads to Prosperity program and progress can be tracked via the WVDOH website.
83	Road repair beyond the scope of this project is being addressed through the Governor's Roads to Prosperity program and progress can be tracked via the WVDOH website.
84	Road repair beyond the scope of this project is being addressed through the Governor's Roads to Prosperity program and progress can be tracked via the WVDOH website.
85	The traffic control plan will continue to be revised during final design, and will not use Aaron's Creek Road as a signed detour. The revised plan intends to utilize the center of the Dorsey/Kingwood roundabout as a temporary intersection with temporary traffic signals. A short-term detour is proposed using Summers School Road while constructing the connection of the existing Kingwood Pike with the new portion.
86	This is out of the scope of the Greenbag Road improvements, but the comment is noted.
87	This is out of the scope of the Greenbag Road improvements, but the comment is noted.
88	The existing grade on Kingwood Pike requires stopping on a -6.5% grade at the traffic signal. The grade approaching the roundabout includes a flat grade of less than 2% at the roundabout. In most cases, the roundabout will not require approaching traffic to come to a full or immediate stop, and does not queue traffic on the steep grade as the existing traffic signal does. Please refer to the EA which evaluates the potential impacts of multiple alternatives on the surrounding area and recommends the preferred alternative as meeting the purpose and need.
89	One of the major differences between Greenbag Road and the Mileground, is the volume of traffic. Greenbag Road has less than half the traffic volume that Mileground has. A second major difference is the general configuration of the roundabouts. The proposed roundabouts on Greenbag are more straightforward and more traditional roundabout designs, without all of the confusing lanes that are present at Mileground. The roundabouts on Greenbag Road will be more intuitive for drivers.

90	Both the MMMPO corridor study and the 2018 traffic study determined that traffic flow through the corridor is controlled by the congestion at the major intersections in the corridor. The projected growth in the Morgantown area will continue to increase traffic and congestion at the intersections if improvements do not occur.
91	The turn lane options that were examined do not improve the level of service as much as the roundabout and the turn lanes at Dorsey Avenue/Kingwood Pike involve complete takes of 2 residences and 1 business. These takes are different from what was reported in the EA. This change will be noted in the FONSI. Adding only left turn lanes on Greenbag Road at the Dorsey/Kingwood Pike intersection was evaluated during an initial round of traffic analysis because this option had been suggested by the MPO. The option included upgrading the signal lights to have a protected/permissive left turn phase. The analysis showed that this option would result in some intersection improvements but could not achieve LOS C or better for the overall intersection operation. The overall intersection would operate at an unacceptable LOS (LOS E or F). The eastbound Greenbag Road traffic queue would extend past the Bluegrass Village Driveway. Based on these findings this option was replaced with Options D and E for the EA analysis.
92	We appreciate your input regarding the project. All comments are reviewed and considered and, regardless of how they are received, all comments carry equal weight.
93	An in-person public meeting is not scheduled at this time. The FHWA approved the use of a virtual public meeting based on the public health concerns related to the COVID-19 pandemic.

101	The studies were completed under the direction of the WVDOH. Traffic and engineering studies were conducted by Stahl Sheaffer Engineering and environmental studies and surveys were conducted by the Markosky Engineering Group and the WVDOH Environmental section. State and federal agencies reviewed the resulting reports for the environmental studies.
102	During the September 29, 2020 virtual public meeting, the WVDOH personnel mentioned during each presentation that live phone calls would not be taken. However, there was a “leave a voicemail” option to leave a message which would be transcribed. Any questions would be read, and comments would become part of the project record.

118	The options presented in the traffic study and Environmental Assessment represent feasible alternatives based on meeting the purpose and need of the project while factoring the topography, safety issues, constructability, and current land use. Stahl Sheaffer is under contract with the WVDOH to assess and develop these plans.
119	We appreciate your understanding during the transition to the virtual meeting format and apologize for any technical difficulties.
120	The aquatic resources study was conducted based on the guiding manuals for wetland and stream identification. The wetland study adhered to the USACE Corps of Engineers Wetland Delineation Manual and the Regional Supplement to the Corps of Engineers Wetland Delineation Manual: Eastern Mountains and Piedmont Region. The stream identification and classification was based on the definitions from Title 46 and the West Virginia Surface Mining Rules. The study identified and delineated 8 palustrine wetlands and 13 jurisdictional watercourses within the project study area. The aquatic resources study is available as an Appendix to the EA on the WVDOH website at https://transportation.wv.gov/highways/engineering/comment/closed/greenbagroadimprovementproject/Pages/default.aspx.

134	We appreciate your understanding during the transition to the virtual meeting format and apologize for any technical difficulties.
135	We appreciate your understanding during the transition to the virtual meeting format and apologize for any technical difficulties. The turn lane options that were examined do not improve the level of service as much as the roundabout at the intersection of Dorsey Avenue/Kingwood Pike. In addition, the turn lane option involves complete takes of 2 residences and 1 business. These takes are different from what was reported in the EA. This change will be noted in the FONSI. Adding only left turn lanes on Greenbag Road at the Dorsey/Kingwood Pike intersection was evaluated during an initial round of traffic analysis because this option had been suggested by the MPO. The option included upgrading the signal lights to have a protected/permissive left turn phase. The analysis showed that this option would result in some

	intersection improvements but could not achieve LOS C or better for the overall intersection operation. It should be noted that LOS C is WVDOH's design year level of service criteria threshold for intersection improvements. The overall intersection would operate at an unacceptable level of service (LOS E). In addition, the left turn lane option would result in the eastbound Greenbag Road traffic queue to extend past the Bluegrass Village Driveway. In regards to safety, a conventional 4-way intersection has 32 points of vehicle conflict due to vehicular maneuvers through the intersection. A roundabout has 8 points of vehicle conflict, which all occur in the same direction, reducing crash severity and likelihood of injury. Studies by the Federal Highway Administration (FHWA) have shown that roundabouts typically achieve reduction in overall collisions, injury collisions, fatality collisions, and pedestrian collisions. Reasons for these reductions due to the installation of a roundabout include: - Low travel speeds – Drivers must slow down and yield to traffic before entering a roundabout. The reduction in speeds results in a decrease in crash severity and injury. - No traffic light "to beat" – The design of a roundabout promotes a continuous circular flow of traffic. Because of this design, drivers will not have the incentive to speed up to "beat the light", like they may at a traditional intersection. - One way travel – The design of a roundabout directs drivers through gently designed curves into a one-way counterclockwise circular path. This design eliminates the possibilities for T-bone and head-on collisions.
136	Due to the time constraints, general comments were not read aloud during the virtual public meeting held on September 29, 2020 from 5 to 8 pm. However, all comments and questions will be made part of the public record and become part of the final environmental clearance document. Questions posed by the public were read and answered during the virtual public meeting in order to provide information regarding the project to the community.
137	Conscious Harvest Cooperative Community Garden, Joy and Hemp Universal LLC, and Mockingbird Hill Farms are located on private property and the property owner will be compensated for the sale of any land to the WVDOH during the right-of-way acquisition process. Impacts to this parcel have been minimized to the extent practicable. Approximately 1.56 acres (67,900 square feet) will be required from the parcel. Fair market value will be paid for all properties that require full or partial acquisition as a result of the project. When only part of the property is required, as is the case with this parcel, fair market value of the part taken will be paid, plus damages, if any, to the residue, less all benefits. West Virginia law defines "market value" as the price a willing buyer would pay a willing seller, neither acting under compulsion nor duress, both exercising prudence and intelligent judgment as to its value and familiar with the purpose for which the property is reasonably available. Fair market value will be determined by a competent, professional real estate appraiser after a thorough inspection of the property, a comparison with similar properties in the area that have been sold recently, a determination and consideration of its replacement cost and depreciation and consideration of the income-producing potential. All appraisal reports are office-reviewed, then rechecked in the field by experienced, qualified review appraisers for accuracy. Since the Division of Highways has adopted a firm price policy, the property owner will be offered the full

	amount of the approved appraisal. There will be no attempt to buy property at less than fair market value. This policy guarantees that all citizens of the state receive full value for the money expended for highway rights of way. Those who hold a valid property interest in the property that is acquired for the project will be compensated during the ROW acquisition phase.
138	We appreciate your input regarding the project.
139	The nature of and impact to this parcel and its uses will be addressed during the acquisition of any necessary portion in a manner that fully addresses any displacement. Conscious Harvest Cooperative Community Garden, Joy and Hemp Universal LLC, and Mockingbird Hill Farms are located on private property and the property owner will be compensated for the sale of any land to the WVDOH during the right-of-way acquisition process. Impacts to this parcel have been minimized to the extent practicable. Approximately 1.56 acres (67,900 square feet) will be required from the parcel. 166	The inscribed circle diameter is the distance across the circle inscribed by the outer curb (or edge) of the circulatory roadway. The proposed Greenbag Road/Dorsey Avenue/Kingwood Pike roundabout is anticipated to provide an approximately 150-foot inscribed circle. The proposed Greenbag Road/Mississippi Avenue roundabout is anticipated to provide an approximately 200-foot inscribed circle. The EA analysis included evaluation of potential impacts to numerous categories including natural resources, cultural resources, land use, indirect, and cumulative effects. More information is available as an Appendix to the EA on the WVDOH website at https://transportation.wv.gov/highways/engineering/comment/closed/greenbagroadimprovementproject/Pages/default.aspx. The West Virginia Division of Natural Resources and the US Fish and Wildlife Service both reviewed the project area. The WVDNR requested a mussel survey if in-stream work is anticipated in Cobun Creek and a spawning waiver if work will occur between April 1 and June 30. WVDOH environmental staff completed mussel and eagle nest surveys on July 22, 2019. No mussels or eagle nests were observed within the Project area. The USFWS reviewed the Project and determined "this project is not likely to adversely affect the Indiana bat." The USFWS also states that "the proposed project … will not affect any known Northern Long Eared Bat (NLEB) hibernacula … and no conservation measures are required." Conscious Harvest Cooperative Community Garden, Joy and Hemp Universal LLC, and Mockingbird Hill Farms are located on private property and the property owner will be compensated for the sale of any land to the WVDOH during the right-of-way acquisition process. 167	Both the MMMPO corridor study and the 2018 traffic study determined that traffic flow through the corridor is controlled by the congestion at the major intersections in the corridor. The projected growth in the Morgantown area will continue to increase traffic and congestion at the intersections if improvements do not occur. The preliminary investigation and engineering traffic study was completed to evaluate the Greenbag Road corridor, evaluating the existing and potential future operation of the intersections selected for study by WVDOH. The Greenbag Road

	corridor has long been recognized as a challenging roadway to navigate due to geometric deficiencies, significant intersection delays during the peak hours, and increased volume of truck traffic and development within the corridor. Several studies have been previously completed through the MMMPO, evaluating various transportation plans for the Greenbag Road corridor, with the ultimate vision of transforming Greenbag Road into a safe, efficient, and attractive multimodal transportation facility. It should be noted that the traffic evaluation was completed prior to the COVID-19 pandemic and its effects to traffic currently occurring. Conscious Harvest Cooperative Community Garden, Joy and Hemp Universal LLC, and Mockingbird Hill Farms are located on private property and the property owner will be compensated for the sale of any land to the WVDOH during the right-of-way acquisition process. Impacts to this parcel have been minimized to the extent practicable. Approximately 1.56 acres (67,900 square feet) will be required from the parcel. 176	The expected completion date for the project is in 2023.
177	At the intersection of Greenbag Road/Dorsey Avenue/Kingwood Pike the traffic analysis determined that the intersection would operate at failure (overall intersection LOS F) if existing intersection conditions and operations were to remain the same 30-years in the future (design year) without any improvements. Adding only left turn lanes on Greenbag Road at the Dorsey/Kingwood Pike intersection was evaluated during an initial round of traffic analysis because this option had been suggested by the MPO. The option included upgrading the signal lights to have a protected/permissive left turn phase. The analysis showed that this option would result in some intersection improvements but could not achieve LOS C or better for the overall intersection operation. The overall intersection would operate at an unacceptable LOS (LOS E). In addition, the left turn lane option would result in the eastbound Greenbag Road traffic queue to extend past the Bluegrass Village Driveway. The traffic analysis determined that with installation of a roundabout the overall intersection would operate at a LOS C, meeting WVDOH design year criteria. At the intersection of Greenbag Road/Mississippi Avenue the traffic analysis determined that the intersection would operate at failure (overall intersection LOS F) if existing intersection conditions and operations were to remain the same 30-years in the future (design year) without any improvements. The design year with improvements scenarios evaluated determined that with installation of a roundabout the overall intersection would operate at a LOS A, best operating conditions, for all peak hours studied. Installation of a traffic signal with turn lanes resulted in an overall intersection LOS B during the AM peak hour, with the Mississippi Avenue approach operating at a LOS C. Though the

	analysis meets WVDOH minimum LOS criteria, the roundabout option exceeds WVDOH minimum LOS criteria. Roundabouts help reduce vehicular delay and promotes a continuous flow of traffic, which increases traffic capacity at an intersection. Roundabouts help reduce the likelihood and severity of collisions. Studies by the Federal Highway Administration (FHWA) have shown that roundabouts typically achieve reduction in overall collisions, injury collisions, fatality collisions, and pedestrian collisions. Reasons for these reductions due to the installation of a roundabout include: Low travel speeds – Drivers must slow down and yield to traffic before entering a roundabout. The reduction in speeds results in a decrease in crash severity and injury. No traffic light "to beat" – The design of a roundabout promotes a continuous circular flow of traffic. Because of this design, drivers will not have the incentive to speed up to "beat the light", like they may at a traditional intersection. One way travel – The design of a roundabout directs drivers through gently designed curves into a one-way counterclockwise circular path. This design eliminates the possibilities for T-bone and head-on collisions. In addition, a conventional 4-way intersection has 32 points of vehicle conflict due to the different maneuvers through the intersection. A roundabout has 8 points of conflict, which all occur in the same direction, reducing crash severity and likelihood of injury. The proposed project includes construction of new sidewalks, which create safe facilities for all users of the corridor. The need for a sidewalk was identified by the public in the comments for the MMMPO corridor study as one of the factors to improve safety in the Greenbag Road corridor.
178	The proposed budget has not yet been accepted.
179	This comment is noted.
180	We appreciate your input regarding the project. Photographs could be received through email or hardcopy mail.
181	Both the MMMPO corridor study and the 2018 traffic study determined that traffic flow through the corridor is controlled by the congestion at the major intersections in the corridor. The projected growth in the Morgantown area will continue to increase traffic and congestion at the intersections if improvements do not occur. One of the major differences between Greenbag Road and the Mileground, is the volume of traffic. Greenbag Road has less than half the traffic volume that Mileground has. A second major difference is the general configuration of the roundabouts. The proposed roundabouts on Greenbag are more straightforward and more traditional roundabout designs, without all of the confusing lanes that are present at Mileground. The roundabouts on Greenbag Road will be more intuitive for drivers. Sidewalks are included in both of the build alternatives considered.

187	The comment is noted.
188	We appreciate your input regarding the project.
189	The traffic control plan will continue to be revised during final design, and will not use Aaron's Creek Road as a signed detour. The revised plan intends to utilize the center of the Dorsey/Kingwood roundabout as a temporary intersection with temporary traffic signals. A short-term detour is proposed using Summers School Road while constructing the connection of the existing Kingwood Pike with the new portion.
190	The traffic control plan will continue to be revised during final design, and will not use Aaron's Creek Road as a signed detour. The revised plan intends to utilize the center of the Dorsey/Kingwood roundabout as a temporary intersection with temporary traffic signals. A short-term detour is proposed using Summers School Road while constructing the connection of the existing Kingwood Pike with the new portion. The option to add left turn lanes only on Greenbag Rd at the Dorsey/Kingwood Pike was one of the options suggested by the MMMPO study and was included on the first round of traffic analysis submitted to the WVDOH in February of 2019. This scenario also included upgrading the existing 2-phase traffic signal to 3-phases to incorporate a protected/permissive left turn phase. Installation of the turn lanes and modifying the signal phasing resulted in various approach and overall intersection LOS improvements; however, LOS C or better for the overall intersection operation could not be achieved. It was projected that some movements and the overall intersection would operate at an unacceptable level of service (LOS E or F). During the PM peak hour, the overall intersection is projected to operate at an overall intersection LOS E, and the eastbound through movement is forecasted to operate at a LOS F. This option would result in the Greenbag Road and Dorsey Avenue approaches queue lengths increasing. The eastbound Greenbag Road through movement queue will continue to extend past the Bluegrass Village driveway. Based on these findings and at the direction of the WVDOH, the traffic analysis was revised using additional options, which developed into Options D and E examined for the EA. The left turn lane only on Greenbag Road was not developed further and no impacts were assessed for the EA. The turn lane options that were examined in the EA do not improve the level of service as much as the roundabout and the turn lanes at Dorsey Avenue/Kingwood Pike involve complete takes of 2 residences and 1 business. These takes are different from what was reported in the EA. This change will be noted in the FONSI.
191	One of the major differences between Greenbag Road and the Mileground, is the volume of traffic. Greenbag Road has less than half the traffic volume that Mileground has. A second major difference is the general configuration of the roundabouts. The proposed roundabouts on Greenbag Road are more straightforward and more traditional roundabout designs, without all of the confusing lanes that are present at

	Mileground. The roundabouts on Greenbag Road will be more intuitive for drivers. Every roundabout is designed and adapted to the context of its location. One way to compare the size of a roundabout would be based on the roundabouts inscribed circle diameter. The inscribed circle diameter is the distance across the circle inscribed by the outer curb (or edge) of the circulatory roadway. The Mileground roundabout provides an approximately 190-foot inscribed circle diameter. The proposed Greenbag Road/Dorsey Avenue/Kingwood Pike roundabout is anticipated to provide an approximately 150-foot inscribed circle. The proposed Greenbag Road/Mississippi Avenue roundabout is anticipated to provide an approximately 200-foot inscribed circle.
192	The nature of and impact to this parcel and its uses will be addressed during the acquisition of any necessary portion in a manner that fully addresses any displacement. Conscious Harvest Cooperative Community Garden, Joy and Hemp Universal LLC, and Mockingbird Hill Farms are located on private property and the property owner will be compensated for the sale of any land to the WVDOH during the right-of-way acquisition process. Impacts to this parcel have been minimized to the extent practicable. Approximately 1.56 acres (67,900 square feet) will be required from the parcel. Fair market value will be paid for all properties that require full or partial acquisition as a result of the project. When only part of the property is required, as is the case with this parcel, fair market value of the part taken will be paid, plus damages, if any, to the residue, less all benefits. West Virginia law defines “market value” as the price a willing buyer would pay a willing seller, neither acting under compulsion nor duress, both exercising prudence and intelligent judgment as to its value and familiar with the purpose for which the property is reasonably available. Fair market value will be determined by a competent, professional real estate appraiser after a thorough inspection of the property, a comparison with similar properties in the area that have been sold recently, a determination and consideration of its replacement cost and depreciation and consideration of the income-producing potential. All appraisal reports are office-reviewed, then rechecked in the field by experienced, qualified review appraisers for accuracy. Since the Division of Highways has adopted a firm price policy, the property owner will be offered the full amount of the approved appraisal. There will be no attempt to buy property at less than fair market value. This policy guarantees that all citizens of the state receive full value for the money expended for highway rights of way. Those who hold a valid property interest in the property that is acquired for the project will be compensated during the ROW acquisition phase.
193	The posted speed limit along Greenbag Road within the study area is 40 mph. Automatic traffic recorder (ATR) counts were conducted on various segments of Greenbag Road throughout the study area. The ATR counts recorded the 85th percentile speeds, which is the speed at or below which 85 percent of the motorists drive. The recorded speeds obtained during the September 2018 – October 2018 counts indicate that most traffic is traveling at or below 45 mph. It is anticipated that a reduction of the posted speed limit to 35 mph would have minimal impact to the current traveling speeds along Greenbag Road. The Greenbag Road improvements are designed to improve the east-west travel corridor. The roundabouts are designed to slow down traffic, because driver must slow down to yield to traffic before entering a roundabout from every approach. The reduction in speed results in a decrease of crash severity and injury.

	At the intersection of Greenbag Road/Dorsey Avenue/Kingwood Pike the traffic analysis determined that the intersection would operate at failure (overall intersection LOS F) if existing intersection conditions and operations were to remain the same 30-years in the future (design year) without any improvements. Adding only left turn lanes on Greenbag Road at the Dorsey Avenue/Kingwood Pike intersection was evaluated during an initial round of traffic analysis because this option had been suggested by the MPO. The option included upgrading the signal lights to have a protected/permissive left turn phase. The analysis showed that this option would result in some intersection improvements but could not achieve LOS C or better for the overall intersection operation, which is WVDOH design year criteria/threshold. The overall intersection would operate at an unacceptable LOS (LOS E). Traffic analyses were also completed at the intersection of Greenbag Road/ Dorsey Avenue/Kingwood Pike assuming left turn and right turn lanes on all approaches to the intersection, as well as traffic signal improvements to provide protected/permissive left turn phases for all left turns and right turn overlap phases for all right turns. This option does not improve the level of service as much as the roundabout and the turn lanes at Dorsey Avenue/Kingwood Pike and this option involves complete takes of 2 residences and 1 business. These takes are different from what was reported in the EA. This change will be noted in the FONSI. The roundabout has been designed with larger vehicles in mind and incorporates truck aprons to support the weight and turning radius of larger vehicles, including school buses. In addition, roundabouts help reduce the likelihood and severity of collisions. Studies by the Federal Highway Administration (FHWA) have shown that roundabouts typically achieve reduction in overall collisions, injury collisions, fatality collisions, and pedestrian collisions. Reasons for these reductions due to the installation of a roundabout include: - Low travel speeds – Drivers must slow down and yield to traffic before entering a roundabout. The reduction in speeds results in a decrease in crash severity and injury. - No traffic light “to beat” – The design of a roundabout promotes a continuous circular flow of traffic. Because of this design, drivers will not have the incentive to speed up to “beat the light”, like they may at a traditional intersection. - One way travel – The design of a roundabout directs drivers through gently designed curves into a one-way counterclockwise circular path. This design eliminates the possibilities for T-bone and head-on collisions. In addition, a conventional 4-way intersection has 32 points of vehicle conflict due to the different crossings and maneuvers through the intersection. A roundabout has 8 points of conflict, which all occur in the same direction, reducing crash severity and likelihood of injury. Lastly, long-term costs associated with roundabouts are significantly less than a traffic signal, since no electrical costs are involved with a roundabout. If a power outage were to occur in the area, the roundabout will continue to function properly without the need of police involvement to direct traffic. Apolla Drive intersection with Dorsey Avenue was not included in the study, but based on review of aerial images, Apolla Drive’s intersection with Dorsey Avenue is approximately 1,130 feet north of Greenbag Road. A review of the queuing analyses completed for all options do not

	forecast queues for the southbound Dorsey Avenue approach to Greenbag Road to extend greater than 500 feet. With the proposed roundabout, queues are forecasted to not exceed 275 feet. In addition, review of aerial images shows that Apolla Drive provides a connection between Dorsey Avenue and Richard Avenue. The comment suggests that traffic flow through Apolla Drive will be greater with the recommended improvements at the intersection of Greenbag Road/Dorsey Avenue/Kingwood Pike, because thru-traffic currently occurs on Apolla Drive. The traffic study did not obtain or analyze Apolla Drive cut through traffic; however, it is theorized that this behavior is happening today due to the significant delays and queues currently occurring at the intersection of Greenbag Road/Dorsey Avenue/Kingwood Pike. With installation of the recommended roundabout, the intersection is forecasted to significantly improve traffic capacity and delays. Therefore, it is theorized that Apolla Drive may see a reduction in cut through traffic since traffic on Greenbag Road can be accommodated through the improved intersection. The operations and traffic flow along Don Knotts Boulevard/Route 119 were not included in the scope of study and therefore were not analyzed. The future traffic along Greenbag Road, Mississippi Avenue, Dorsey Avenue, Kingwood Pike were projected for the future design year by assuming existing traffic distribution/patterns but with increased traffic volumes though application of a yearly traffic growth rate of 1.16% per year. The noise analysis report indicates the Greenbag Road and intersection improvements for this alternative do not meet the requirements for either a Type I or Type II project. The Project is classified as a Type III project and a detailed noise analysis for highway traffic noise impacts was not required. The Type III noise analysis is available as an Appendix to the EA on the WVDOH website at https://transportation.wv.gov/highways/engineering/comment/closed/greenbagroadimprovementproject/Pages/default.aspx.
194	The noise analysis report indicates the Greenbag Road and intersection improvements for this alternative do not meet the requirements for either a Type I or Type II project. The Project is classified as a Type III project and a detailed noise analysis for highway traffic noise impacts was not required. The Type III noise analysis is available as an Appendix to the EA on the WVDOH website at https://transportation.wv.gov/highways/engineering/comment/closed/greenbagroadimprovementproject/Pages/default.aspx.
195	Apolla Drive is beyond the scope of the current project.
196	We appreciate your understanding during the transition to the virtual meeting format and apologize for any technical difficulties.
197	Conscious Harvest Cooperative Community Garden, Joy and Hemp Universal LLC, and Mockingbird Hill Farms are located on private property and the property owner will be compensated for the sale of any land to the WVDOH during the right-of-way acquisition process. Impacts to this parcel have been minimized to the extent practicable. Approximately 1.56 acres (67,900 square feet) will be required from the parcel. Fair market value will be paid for all properties that require full or partial acquisition as a result of the project. When only part of the property is required, as is the case with this parcel, fair market value of the part taken will be paid, plus damages, if any, to the residue, less all benefits. West Virginia law defines “market value” as the price a willing buyer would pay a willing seller, neither acting under compulsion nor duress, both exercising prudence and intelligent judgment as to its value and familiar with the purpose for which the property is reasonably available. Fair

	market value will be determined by a competent, professional real estate appraiser after a thorough inspection of the property, a comparison with similar properties in the area that have been sold recently, a determination and consideration of its replacement cost and depreciation and consideration of the income-producing potential. All appraisal reports are office-reviewed, then rechecked in the field by experienced, qualified review appraisers for accuracy. Since the Division of Highways has adopted a firm price policy, the property owner will be offered the full amount of the approved appraisal. There will be no attempt to buy property at less than fair market value. This policy guarantees that all citizens of the state receive full value for the money expended for highway rights of way. Those who hold a valid property interest in the property that is acquired for the project will be compensated during the ROW acquisition phase.
198	One benefit of the installation of roundabouts is that roundabouts are designed to slow speeds in the approach and through the roundabout.
199	Conscious Harvest Cooperative Community Garden, Joy and Hemp Universal LLC, and Mockingbird Hill Farms are located on private property and the property owner will be compensated for the sale of any land to the WVDOH during the right-of-way acquisition process. Those who hold a valid property interest in the property that is acquired for the project will be compensated during the ROW acquisition phase.
204	The timeframe of construction is currently unknown at this time, since the improvement plans are in preliminary design. However, it is anticipated that access to the prison will be maintained during construction.
205	The preliminary investigation and engineering traffic study was completed to evaluate the Greenbag Road corridor, evaluating the existing and potential future operation of the intersections selected for study by WVDOH. The Greenbag Road corridor has long been recognized as a challenging roadway to navigate due to geometric deficiencies, significant intersection delay during the peak hours, and increased volume of truck traffic and development within the corridor. Several studies have been previously completed through the MMMPO, evaluating various transportation plans for the Greenbag Road corridor, with the ultimate vision of transforming Greenbag Road into a safe, efficient, and attractive multimodal transportation facility. The traffic analysis has examined two build alternatives and three options for each of the major intersections. The intersection options that were evaluated and analyzed include turning lanes, traffic signals, and roundabouts. WVDOH requires intersection improvements to meet or exceed an overall intersection LOS C or better during the peak hours studied for design year improvements. The traffic analysis determined that the intersection of Greenbag Road/Mississippi Avenue would operate at failure (overall intersection LOS F) if existing intersection conditions and operations were to remain the same 30-years in the future (design year) without any improvements. The design year with improvements scenarios evaluated determined that with the installation of a roundabout the overall intersection would operate at a LOS A, best operating conditions. Likewise, the traffic analysis determined that the intersection of Greenbag Road/Dorsey Avenue/Kingwood Pike would also operate at failure (overall intersection LOS F) if existing intersection conditions and operations were to remain the same 30-years in the future (design

	year) without any improvements. The design year with improvements scenarios evaluated determined that with installation of a roundabout, the overall intersection would operate at a LOS C, meeting WVDOH design year criteria. Roundabouts help reduce the likelihood and severity of collisions. Conventional 4-way intersection has 32 points of vehicle conflict due to the different vehicular maneuvers through the intersection. A roundabout has 8 points of conflict, which all occur in the same direction, reducing crash severity and likelihood of injury. Studies by the Federal Highway Administration (FHWA) have shown that roundabouts typically achieve reduction in overall collisions, injury collisions, fatality collisions, and pedestrian collisions. Reasons for these reductions due to the installation of a roundabout include: - Low travel speeds – Drivers must slow down and yield to traffic before entering a roundabout. The reduction in speeds results in a decrease in crash severity and injury. - No traffic light "to beat" – The design of a roundabout promotes a continuous circular flow of traffic. Because of this design, drivers will not have the incentive to speed up to "beat the light", like they may at a traditional intersection. - One way travel – The design of a roundabout directs drivers through gently designed curves into a one-way counterclockwise circular path. This design eliminates the possibilities for T-bone and head-on collisions. The Greenbag Road roundabouts have major differences to other existing roundabouts within Morgantown, including the Mileground. Greenbag Road has less than half the traffic volume of the Mileground. A second major difference is the general configuration of the roundabouts. The proposed roundabouts on Greenbag are more straightforward and more traditional roundabout designs, without all of the confusing lanes that are present at Mileground. The roundabouts on Greenbag Road will be more intuitive for drivers. Every roundabout is designed and adapted to the context of its location.
206	The design of the Mileground Roundabout is beyond the scope of the current project. One of the major differences between Greenbag Road and the Mileground, is the volume of traffic. Greenbag Road has less than half the traffic volume that Mileground has. A second major difference is the general configuration of the roundabouts. The proposed roundabouts on Greenbag are more straightforward and more traditional roundabout designs, without all of the confusing lanes that are present at Mileground. The roundabouts on Greenbag Road will be more intuitive for drivers.
207	The EA reviewed multiple alternatives including turn lanes, traffic lights, and the roundabouts. Through the analysis in the EA, the only alternative that meets the purpose and need of the project is the roundabout. The traffic control plan will continue to be revised during final design, and will not use Aaron's Creek Road as a signed detour. The revised plan intends to utilize the center of the Dorsey/Kingwood roundabout as a temporary intersection with temporary traffic signals. A short-term detour is proposed using Summers School Road while constructing the connection of the existing Kingwood Pike with the new portion.
208	The turn lane options that were examined do not improve the level of service as much as the roundabout and the turn lanes at Dorsey Avenue/Kingwood Pike involve complete takes of 2 residences and 1 business. These takes are different from what was reported in the EA.

	This change will be noted in the FONSI. Adding only left turn lanes on Greenbag Road at the Dorsey/Kingwood Pike intersection was evaluated during an initial round of traffic analysis because this option had been suggested by the MPO. The option included upgrading the signal lights to have a protected/permissive left turn phase. The analysis showed that this option would result in some intersection improvements but could not achieve LOS C or better for the overall intersection operation. The overall intersection would operate at an unacceptable LOS (LOS E or F). The eastbound Greenbag Road traffic queue would extend past the Bluegrass Village Driveway. Based on these findings this option was replaced with Options D and E for the EA analysis.
209	No residences would be displaced by the roundabout options.
210	The posted speed limit along Greenbag Road within the study area is 40 mph. Automatic traffic recorder (ATR) counts were conducted on various segments of Greenbag Road throughout the study area. The ATR counts recorded the 85th percentile speeds, which is the speed at or below which 85 percent of the motorists drive. The recorded speeds obtained during the September 2018 – October 2018 counts indicate that most traffic is traveling at or below 45 mph. It is anticipated that a reduction of the posted speed limit to 35 mph would have minimal impact to the current traveling speeds along Greenbag Road. The Greenbag Road improvements are designed to improve the east-west travel corridor. The roundabouts are designed to slow down traffic, because driver must slow down to yield to traffic before entering a roundabout from every approach. The reduction in speed results in a decrease of crash severity and injury. The operations and traffic flow along Don Knotts Boulevard/Route 119 were not included in the scope of study and therefore were not analyzed. The future traffic along Greenbag Road, Mississippi Avenue, Dorsey Avenue, Kingwood Pike were projected for the future design year by assuming existing traffic distribution/patterns but with increased traffic volumes though application of a yearly traffic growth rate of 1.16% per year. The turn lane options that were examined do not improve the level of service as much as the roundabout and the turn lanes at Dorsey Avenue/Kingwood Pike involve complete takes of 2 residences and 1 business. These takes are different from what was reported in the EA. This change will be noted in the FONSI. A roundabout may need a little more property within the actual intersection but will take up less space on the streets approaching the roundabout.
211	The additional right-of-way required for the non-roundabout options would result in displacement of residences in the northwest quadrant of Greenbag Road / Dorsey Avenue / Kingwood Pike.
212	The WVDOH has an educational video on how to use a roundabout available for viewing at https://www.youtube.com/watch?v=7njH4MKyo0w. Signage meeting WVDOH and the Federal Manual on Uniform Traffic Control Devices will be placed to assist drivers with navigating the roundabouts.
213	The noise analysis report indicates the Greenbag Road and intersection improvements for this alternative do not meet the requirements for either a Type I or Type II project. The Project is classified as a Type III project and a detailed noise analysis for highway traffic noise impacts

	was not required. The Type III noise analysis is available as an Appendix to the EA on the WVDOH website at https://transportation.wv.gov/highways/engineering/comment/closed/greenbagroadimprovementproject/Pages/default.aspx.
214	Conscious Harvest Cooperative Community Garden, Joy and Hemp Universal LLC, and Mockingbird Hill Farms are located on private property and the property owner will be compensated for the sale of any land to the WVDOH during the right-of-way acquisition process. Impacts to this parcel have been minimized to the extent practicable. Approximately 1.56 acres (67,900 square feet) will be required from the parcel. Fair market value will be paid for all properties that require full or partial acquisition as a result of the project. When only part of the property is required, as is the case with this parcel, fair market value of the part taken will be paid, plus damages, if any, to the residue, less all benefits. West Virginia law defines "market value" as the price a willing buyer would pay a willing seller, neither acting under compulsion nor duress, both exercising prudence and intelligent judgment as to its value and familiar with the purpose for which the property is reasonably available. Fair market value will be determined by a competent, professional real estate appraiser after a thorough inspection of the property, a comparison with similar properties in the area that have been sold recently, a determination and consideration of its replacement cost and depreciation and consideration of the income-producing potential. All appraisal reports are office-reviewed, then rechecked in the field by experienced, qualified review appraisers for accuracy. Since the Division of Highways has adopted a firm price policy, the property owner will be offered the full amount of the approved appraisal. There will be no attempt to buy property at less than fair market value. This policy guarantees that all citizens of the state receive full value for the money expended for highway rights of way. Those who hold a valid property interest in the property that is acquired for the project will be compensated during the ROW acquisition phase.
215	It is anticipated that access to the prison will be maintained during construction. The Traffic Control plan will be developed during final design and input from prison staff will be coordinated.
216	One of the major differences between Greenbag Road and the Mileground, is the volume of traffic. Greenbag Road has less than half the traffic volume that Mileground has. A second major difference is the general configuration of the roundabouts. The proposed roundabouts on Greenbag are more straightforward and more traditional roundabout designs, without all of the confusing lanes that are present at Mileground. The roundabouts on Greenbag Road will be more intuitive for drivers. Conscious Harvest Cooperative Community Garden, Joy and Hemp Universal LLC, and Mockingbird Hill Farms are located on private property and the property owner will be compensated for the sale of any land to the WVDOH during the right-of-way acquisition process. Impacts to this parcel have been minimized to the extent practicable. Approximately 1.56 acres (67,900 square feet) will be required from the parcel. Fair market value will be paid for all properties that require full or partial acquisition as a result of the project. When only part of the property is required, as is the case with this parcel, fair market value of the part taken will be paid, plus damages, if any, to the residue, less all benefits. West Virginia law defines "market value" as the price a willing buyer would pay a willing seller, neither acting under compulsion nor duress, both exercising prudence and intelligent judgment as to its value and familiar with the purpose for which the property is reasonably available. Fair market value will be determined by a competent, professional real estate appraiser after a thorough inspection of the property, a comparison with similar properties in the area that have been sold recently, a determination and consideration of its replacement cost and depreciation and

	consideration of the income-producing potential. All appraisal reports are office-reviewed, then rechecked in the field by experienced, qualified review appraisers for accuracy. Since the Division of Highways has adopted a firm price policy, the property owner will be offered the full amount of the approved appraisal. There will be no attempt to buy property at less than fair market value. This policy guarantees that all citizens of the state receive full value for the money expended for highway rights of way. Those who hold a valid property interest in the property that is acquired for the project will be compensated during the ROW acquisition phase.
217	The traffic control plan will continue to be revised during final design, and will not use Aaron's Creek Road as a signed detour. The revised plan intends to utilize the center of the Dorsey/Kingwood roundabout as a temporary intersection with temporary traffic signals. A short-term detour is proposed using Summers School Road while constructing the connection of the existing Kingwood Pike with the new portion. Road repair beyond the scope of this project is being addressed through the Governor's Roads to Prosperity program and progress can be tracked via the WVDOH website.
218	The WVDOH will coordinate with all utility companies within the project area to relocate any utility lines which would be impacted by the project construction.
219	The turn lane options that were examined (including Option E) do not improve the level of service as much as the roundabout and the turn lanes at Dorsey Avenue/Kingwood Pike involve complete takes of 2 or 3 residences (depending on the turn lane option selected). The operations and traffic flow along Don Knotts Boulevard/Route 119 were not included in the scope of study and therefore were not analyzed. The future traffic along Greenbag Road, Mississippi Avenue, Dorsey Avenue, Kingwood Pike were projected for the future design year by assuming existing traffic distribution/patterns but with increased traffic volumes though application of a yearly traffic growth rate of 1.16% per year.
220	Any property needed for the project will be acquired under the Uniform Relocation Assistance and Real Property Acquisition Act (1970) through negotiations with the landowners.
221	The improvement to the level of service is calculated between the no build option and the selected alternative. Option F improves the level of service by three grade levels in the morning and afternoon time periods.
222	The Greenbag Road improvements are designed to improve the east-west travel corridor. The operations and traffic flow along Don Knotts Boulevard/Route 119 were not included in the scope of study and therefore were not analyzed. The future traffic along Greenbag Road, Mississippi Avenue, Dorsey Avenue, Kingwood Pike were projected for the future design year by assuming existing traffic distribution/patterns but with increased traffic volumes though application of a yearly traffic growth rate of 1.16% per year
223	Roundabouts are designed to maintain a constant flow of traffic through the intersection which results in reduced congestion on roadways and a reduction in delays for drivers. Studies have shown that changing signalized intersections to roundabouts can have up to an 89% average

	reduction in vehicle delays. The improved traffic flow also results in reduced vehicle emissions including carbon monoxide, nitrous oxide, and carbon dioxide at the intersection. The WVDOH has examined two build alternatives and three options for each of the major intersections. The intersection options that were evaluated and analyzed include turning lanes, traffic signals, and roundabouts. The evaluation and analysis of these intersection options indicate that the roundabout would provide the most improvement to traffic congestion, has the lowest estimated construction cost, and does not displace any residences.
224	The turn lane options that were examined do not improve the level of service as much as the roundabout at the intersection of Dorsey Avenue/Kingwood Pike. In addition, the turn lane option involves complete takes of 2 residences and 1 business. These takes are different from what was reported in the EA. This change will be noted in the FONSI. Adding only left turn lanes on Greenbag Road at the Dorsey/Kingwood Pike intersection was evaluated during an initial round of traffic analysis because this option had been suggested by the MPO. The option included upgrading the signal lights to have a protected/permissive left turn phase. The analysis showed that this option would result in some intersection improvements but could not achieve LOS C or better for the overall intersection operation. It should be noted that LOS C is WVDOH's design year level of service criteria threshold for intersection improvements. The overall intersection would operate at an unacceptable level of service (LOS E). In addition, the left turn lane option would result in the eastbound Greenbag Road traffic queue to extend past the Bluegrass Village Driveway. In regards to safety, a conventional 4-way intersection has 32 points of vehicle conflict due to vehicular maneuvers through the intersection. A roundabout has 8 points of vehicle conflict, which all occur in the same direction, reducing crash severity and likelihood of injury. Studies by the Federal Highway Administration (FHWA) have shown that roundabouts typically achieve reduction in overall collisions, injury collisions, fatality collisions, and pedestrian collisions. Reasons for these reductions due to the installation of a roundabout include: - Low travel speeds – Drivers must slow down and yield to traffic before entering a roundabout. The reduction in speeds results in a decrease in crash severity and injury. - No traffic light "to beat" – The design of a roundabout promotes a continuous circular flow of traffic. Because of this design, drivers will not have the incentive to speed up to "beat the light", like they may at a traditional intersection. - One way travel – The design of a roundabout directs drivers through gently designed curves into a one-way counterclockwise circular path. This design eliminates the possibilities for T-bone and head-on collisions. In regards to cost, since the traffic analysis determined that left turn lanes on Greenbag Road did not meet WVDOH's LOS criteria, a cost estimate was not prepared. However, long-term costs associated with roundabouts are significantly less than a traffic signal, since no electrical costs and no traffic signal maintenance are involved with a roundabout.

225	Road repair beyond the scope of this project is being addressed through the Governor's Roads to Prosperity program and progress can be tracked via the WVDOH website.
226	The traffic control plan will continue to be revised during final design, and will not use Aaron's Creek Road as a signed detour. The revised plan intends to utilize the center of the Dorsey/Kingwood roundabout as a temporary intersection with temporary traffic signals. A short-term detour is proposed using Summers School Road while constructing the connection of the existing Kingwood Pike with the new portion.
227	Both the MMMPO corridor study and the 2018 traffic study determined that traffic flow through the corridor is controlled by the congestion at the major intersections in the corridor. The projected growth in the Morgantown area will continue to increase traffic and congestion at the intersections if improvements do not occur. The diversion of traffic, including large trucks, from downtown is not within the scope of this project.
228	Changes to the interstate access in Morgantown are beyond the scope of the current project. Road repair beyond the scope of this project is being addressed through the Governor's Roads to Prosperity program and progress can be tracked via the WVDOH website. The turn lane options that were examined do not improve the level of service as much as the roundabout and the turn lanes at Dorsey Avenue/Kingwood Pike involve complete takes of 2 residences and 1 business. These takes are different from what was reported in the EA. This change will be noted in the FONSI. Adding only left turn lanes on Greenbag Road at the Dorsey/Kingwood Pike intersection was evaluated during an initial round of traffic analysis because this option had been suggested by the MPO. The option included upgrading the signal lights to have a protected/permissive left turn phase. The analysis showed that this option would result in some intersection improvements but could not achieve LOS C or better for the overall intersection operation. The overall intersection would operate at an unacceptable LOS (LOS E or F). The eastbound Greenbag Road traffic queue would extend past the Bluegrass Village Driveway. Based on these findings this option was replaced with Options D and E for the EA analysis.
229	The Greenbag Road improvements are designed to improve the east-west travel corridor. The diversion of traffic, including large trucks, from downtown is not within the scope of this project.
230	The WVDOH has examined two build alternatives and three options for each of the major intersections. The intersection options that were evaluated and analyzed include turning lanes, traffic signals, and roundabouts. The evaluation and analysis of these intersection options indicate that the roundabout would provide the most improvement to traffic congestion, has the lowest estimated construction cost, and does not displace any residences. The EA reviewed multiple alternatives including turn lanes, traffic lights, and the roundabouts. Through the analysis in the EA, the only alternative that meets the purpose and need of the project is the roundabout.
231	The Greenbag Road improvements are designed to improve the east-west travel corridor. Construction is estimated to occur in 2022 and 2023. The posted speed limit along Greenbag Road within the study area is 40 mph. Automatic traffic recorder (ATR) counts were conducted on various segments of Greenbag Road throughout the study area. The ATR counts recorded the 85th percentile speeds, which is the speed at or below which 85 percent of the motorists drive. The recorded speeds obtained during the September 2018 – October 2018 counts indicate that

	most traffic is traveling at or below 45 mph. It is anticipated that a reduction of the posted speed limit to 35 mph would have minimal impact to the current traveling speeds along Greenbag Road. The preferred alternative is anticipated to require 1.5 to 2 construction seasons. The diversion of traffic from downtown is not within the scope of this project.
232	Conscious Harvest Cooperative Community Garden, Joy and Hemp Universal LLC, and Mockingbird Hill Farms are located on private property and the property owner will be compensated for the sale of any land to the WVDOH during the right-of-way acquisition process. Impacts to this parcel have been minimized to the extent practicable. Approximately 1.56 acres (67,900 square feet) will be required from the parcel. Fair market value will be paid for all properties that require full or partial acquisition as a result of the project. When only part of the property is required, as is the case with this parcel, fair market value of the part taken will be paid, plus damages, if any, to the residue, less all benefits. West Virginia law defines "market value" as the price a willing buyer would pay a willing seller, neither acting under compulsion nor duress, both exercising prudence and intelligent judgment as to its value and familiar with the purpose for which the property is reasonably available. Fair market value will be determined by a competent, professional real estate appraiser after a thorough inspection of the property, a comparison with similar properties in the area that have been sold recently, a determination and consideration of its replacement cost and depreciation and consideration of the income-producing potential. All appraisal reports are office-reviewed, then rechecked in the field by experienced, qualified review appraisers for accuracy. Since the Division of Highways has adopted a firm price policy, the property owner will be offered the full amount of the approved appraisal. There will be no attempt to buy property at less than fair market value. This policy guarantees that all citizens of the state receive full value for the money expended for highway rights of way. Those who hold a valid property interest in the property that is acquired for the project will be compensated during the ROW acquisition phase.
233	Conscious Harvest Cooperative Community Garden, Joy and Hemp Universal LLC, and Mockingbird Hill Farms are located on private property and the property owner will be compensated for the sale of any land to the WVDOH during the right-of-way acquisition process. Impacts to this parcel have been minimized to the extent practicable. Approximately 1.56 acres (67,900 square feet) will be required from the parcel. Fair market value will be paid for all properties that require full or partial acquisition as a result of the project. When only part of the property is required, as is the case with this parcel, fair market value of the part taken will be paid, plus damages, if any, to the residue, less all benefits. West Virginia law defines "market value" as the price a willing buyer would pay a willing seller, neither acting under compulsion nor duress, both exercising prudence and intelligent judgment as to its value and familiar with the purpose for which the property is reasonably available. Fair market value will be determined by a competent, professional real estate appraiser after a thorough inspection of the property, a comparison with similar properties in the area that have been sold recently, a determination and consideration of its replacement cost and depreciation and consideration of the income-producing potential. All appraisal reports are office-reviewed, then rechecked in the field by experienced, qualified review appraisers for accuracy. Since the Division of Highways has adopted a firm price policy, the property owner will be offered the full

	amount of the approved appraisal. There will be no attempt to buy property at less than fair market value. This policy guarantees that all citizens of the state receive full value for the money expended for highway rights of way. Those who hold a valid property interest in the property that is acquired for the project will be compensated during the ROW acquisition phase.
234	The cultural resources surveys were conducted according to the guidelines published by the WV State Historic Preservation Office. The archaeological survey included the excavation of 213 shovel test pits, one test excavation unit, and visual inspection of the entire surface area within the defined area of potential effect. Based on the SHPO guidelines, when no cultural resources are identified during the Phase I survey, an abbreviated technical report is acceptable. As the reviewing agency, the WV SHPO concurred with the recommendation that no further archaeological investigations were warranted and no archaeological historic properties are present in the study area. The historic structures survey resulted in the identification of 25 structures 45+ years old within the defined area of potential effect. Two of the resources were recommended eligible for the National Register of Historic Places and the project was designed to avoid potential impacts to these properties. As the reviewing agency, the WV SHPO concurred with the recommendation that the project would not adversely affect any NRHP eligible resources and that no further historic structures investigations were needed. The cultural resources reports are available as an Appendix to the EA on the WVDOH website at https://transportation.wv.gov/highways/engineering/comment/closed/greenbagroadimprovementproject/Pages/default.aspx.
235	This comment is noted.
236	The comment is noted.
237	One of the major differences between Greenbag Road and the Mileground, is the volume of traffic. Greenbag Road has less than half the traffic volume that Mileground has. A second major difference is the general configuration of the roundabouts. The proposed roundabouts on Greenbag are more straightforward and more traditional roundabout designs, without all of the confusing lanes that are present at Mileground. The roundabouts on Greenbag Road will be more intuitive for drivers. The property owner associated with the community garden will be compensated for the sale of the land to the WVDOH during the right-of-way acquisition process. Impacts to the property were evaluated and have been minimized to the extent practicable. When only part of the property is required, as is the case with the referenced property, fair market value of the part taken will be paid, plus damages, if any, to the residue, less all benefits. The additional right-of-way and/or easements required from this property is not expected to notably affect operations or result in a total take / displacement of the property.
238	The aquatic resources study was conducted based on the guiding manuals for wetland and stream identification. The wetland study adhered to the USACE Corps of Engineers Wetland Delineation Manual and the Regional Supplement to the Corps of Engineers Wetland Delineation Manual: Eastern Mountains and Piedmont Region. The stream identification and classification was based on the definitions from Title 46 and the West Virginia Surface Mining Rules. The study identified and delineated 8 palustrine wetlands and 13 jurisdictional watercourses within the project study area. The West Virginia Division of Natural Resources and the US Fish and Wildlife Service both reviewed the project area. The WVDNR requested a mussel survey if in-stream work is anticipated in Cobun Creek and a spawning waiver if work will occur between April 1

	and June 30. WVDOH environmental staff completed mussel and eagle nest surveys on July 22, 2019. No mussels or eagle nests were observed within the Project area. The USFWS reviewed the Project and determined "this project is not likely to adversely affect the Indiana bat." The USFWS also states that "the proposed project … will not affect any known Northern Long Eared Bat (NLEB) hibernacula … and no conservation measures are required."
239	The comment is noted.
240	Of the Mississippi Street options, Option C is the most expensive.
241	We appreciate your input regarding the project.
242	At this time the proposed retaining wall on the south side of Greenbag Road east of the roundabout is anticipated to be approximately 350 feet in length and 8 to 18 feet tall.
243	Alternative 2 Option F at Dorsey Avenue/Kingwood Pike is lower than Options D or E for the same corresponding options at the Mississippi Street intersection. The lowest cost alternative overall is Alternative 2, Option A (at Mississippi Street) and Option F (at Dorsey Avenue/Kingwood Pike.
244	The improvement to the level of service is calculated between the no build option and the selected alternative. Option F improves the level of service by three grade levels in the morning and afternoon time periods.
245	We appreciate your input regarding the project.
246	Roundabouts are designed to maintain a constant flow of traffic through the intersection which results in reduced congestion on roadways and a reduction in delays for drivers. Studies have shown that changing signalized intersections to roundabouts can have up to an 89% average reduction in vehicle delays. The improved traffic flow also results in reduced vehicle emissions including carbon monoxide, nitrous oxide, and carbon dioxide at the intersection. Additionally, roundabouts are designed to slow speeds in the approach and through the roundabout allowing drivers more response time and limiting the number of potential directions where traffic could approach. Both of these factors improve safety for all drivers, including older drivers as well as pedestrians, and cyclists.
247	The roundabouts were designed to accommodate AASHTO WB-62 truck configuration, which is an interstate semi-truck with a 62' wheel base between steer axle and last trailer axle, including a 48' trailer. Larger trucks can navigate the roundabout and use the internal truck apron. Roundabouts help reduce the likelihood and severity of collisions. Studies by the Federal Highway Administration (FHWA) have shown that roundabouts typically achieve reduction in overall collisions, injury collisions, fatality collisions, and pedestrian collisions. Reasons for these reductions due to the installation of a roundabout include:

	Low travel speeds – Drivers must slow down and yield to traffic before entering a roundabout. The reduction in speeds results in a decrease in crash severity and injury. No traffic light "to beat" – The design of a roundabout promotes a continuous circular flow of traffic. Because of this design, drivers will not have the incentive to speed up to "beat the light", like they may at a traditional intersection. One way travel – The design of a roundabout directs drivers through gently designed curves into a one-way counterclockwise circular path. This design eliminates the possibilities for T-bone and head-on collisions. In addition, a conventional 4-way intersection has 32 points of vehicle conflict due to the different maneuvers through the intersection. A roundabout has 8 points of conflict, which all occur in the same direction, reducing crash severity and likelihood of injury.
248	The final design will factor the geotechnical information needed to design the retaining wall and prevent further damage. The cultural resources surveys were conducted according to the guidelines published by the WV State Historic Preservation Office. The historic structures survey resulted in the identification of 25 structures 45+ years old within the defined area of potential effect. Two of the resources were recommended eligible for the National Register of Historic Places and the project was designed to avoid potential impacts to these properties. As the reviewing agency, the WV SHPO concurred with the recommendation that the project would not adversely affect any NRHP eligible resources and that no further historic structures investigations were needed. The cultural resources reports are available as an Appendix to the EA on the WVDOH website at https://transportation.wv.gov/highways/engineering/comment/closed/greenbagroadimprovementproject/Pages/default.aspx
249	Conscious Harvest Cooperative Community Garden, Joy and Hemp Universal LLC, and Mockingbird Hill Farms are located on private property and the property owner will be compensated for the sale of any land to the WVDOH during the right-of-way acquisition process. Impacts to this parcel have been minimized to the extent practicable. Approximately 1.56 acres (67,900 square feet) will be required from the parcel. Fair market value will be paid for all properties that require full or partial acquisition as a result of the project. When only part of the property is required, as is the case with this parcel, fair market value of the part taken will be paid, plus damages, if any, to the residue, less all benefits. West Virginia law defines "market value" as the price a willing buyer would pay a willing seller, neither acting under compulsion nor duress, both exercising prudence and intelligent judgment as to its value and familiar with the purpose for which the property is reasonably available. Fair market value will be determined by a competent, professional real estate appraiser after a thorough inspection of the property, a comparison with similar properties in the area that have been sold recently, a determination and consideration of its replacement cost and depreciation and consideration of the income-producing potential. All appraisal reports are office-reviewed, then rechecked in the field by experienced, qualified review appraisers for accuracy. Since the Division of Highways has adopted a firm price policy, the property owner will be offered the full amount of the approved appraisal. There will be no attempt to buy property at less than fair market value. This policy guarantees that all citizens of the state receive full value for the money expended for highway rights of way.

	Those who hold a valid property interest in the property that is acquired for the project will be compensated during the ROW acquisition phase.
250	The turn lane options that were examined do not improve the level of service as much as the roundabout and the turn lanes at Dorsey Avenue/Kingwood Pike involve complete takes of 2 residences and 1 business. These takes are different from what was reported in the EA. This change will be noted in the FONSI. The roundabouts have been designed with larger vehicles in mind and incorporate truck aprons designed to support the weight and turning radius of larger vehicles, including school buses. Adding only left turn lanes on Greenbag Road at the Dorsey/Kingwood Pike intersection was evaluated during an initial round of traffic analysis because this option had been suggested by the MPO. The option included upgrading the signal lights to have a protected/permissive left turn phase. The analysis showed that this option would result in some intersection improvements but could not achieve LOS C or better for the overall intersection operation. The overall intersection would operate at an unacceptable LOS (LOS E or F). The eastbound Greenbag Road traffic queue would extend past the Bluegrass Village Driveway. Based on these findings this option was replaced with Options D and E for the EA analysis. One of the major differences between Greenbag Road and the Mileground, is the volume of traffic. Greenbag Road has less than half the traffic volume that Mileground has. A second major difference is the general configuration of the roundabouts. The proposed roundabouts on Greenbag are more straightforward and more traditional roundabout designs, without all of the confusing lanes that are present at Mileground. The roundabouts on Greenbag Road will be more intuitive for drivers. Roundabouts help reduce the likelihood and severity of collisions. Studies by the Federal Highway Administration (FHWA) have shown that roundabouts typically achieve reduction in overall collisions, injury collisions, fatality collisions, and pedestrian collisions. Reasons for these reductions due to the installation of a roundabout include: Low travel speeds – Drivers must slow down and yield to traffic before entering a roundabout. The reduction in speeds results in a decrease in crash severity and injury. No traffic light “to beat” – The design of a roundabout promotes a continuous circular flow of traffic. Because of this design, drivers will not have the incentive to speed up to “beat the light”, like they may at a traditional intersection. One way travel – The design of a roundabout directs drivers through gently designed curves into a one-way counterclockwise circular path. This design eliminates the possibilities for T-bone and head-on collisions. In addition, a conventional 4-way intersection has 32 points of vehicle conflict due to the different maneuvers through the intersection. A roundabout has 8 points of conflict, which all occur in the same direction, reducing crash severity and likelihood of injury.
251	Adding only left turn lanes on Greenbag Road at the Dorsey/Kingwood Pike intersection was evaluated during an initial round of traffic analysis because this option had been suggested by the MPO. The option included upgrading the signal lights to have a protected/permissive left turn phase. The analysis showed that this option would result in some intersection improvements but could not achieve LOS C or better for the overall intersection operation. The overall intersection would operate at an unacceptable LOS (LOS E or F). The eastbound Greenbag Road

	traffic queue would extend past the Bluegrass Village Driveway. Based on these findings this option was replaced with Options D and E for the EA analysis.
252	An in-person public meeting is not scheduled at this time. The FHWA approved the use of a virtual public meeting based on the public health concerns related to the COVID-19 pandemic.
253	Any property needed for the project will be acquired under the Uniform Relocation Assistance and Real Property Acquisition Act (1970) through negotiations with the landowners.
254	The traffic control plan will continue to be revised during final design, and will not use Aaron's Creek Road as a signed detour. The revised plan intends to utilize the center of the Dorsey/Kingwood roundabout as a temporary intersection with temporary traffic signals. A short-term detour is proposed using Summers School Road while constructing the connection of the existing Kingwood Pike with the new portion.
255	The traffic control plan will continue to be revised during final design, and will not use Aaron's Creek Road as a signed detour. The revised plan intends to utilize the center of the Dorsey/Kingwood roundabout as a temporary intersection with temporary traffic signals. A short-term detour is proposed using Summers School Road while constructing the connection of the existing Kingwood Pike with the new portion.
256	The comment is noted.
257	We appreciate your input regarding the project.
258	The chat window was available on the project's public input website during the virtual public meeting on September 29, 2020 from 5 to 8 pm.
259	The traffic control plan will continue to be revised during final design, and will not use Aaron's Creek Road as a signed detour. The revised plan intends to utilize the center of the Dorsey/Kingwood roundabout as a temporary intersection with temporary traffic signals. A short-term detour is proposed using Summers School Road while constructing the connection of the existing Kingwood Pike with the new portion.
260	The noise analysis report indicates the Greenbag Road and intersection improvements for this alternative do not meet the requirements for either a Type I or Type II project. The Project is classified as a Type III project and a detailed noise analysis for highway traffic noise impacts was not required. The Type III noise analysis is available as an Appendix to the EA on the WVDOH website at https://transportation.wv.gov/highways/engineering/comment/closed/greenbagroadimprovementproject/Pages/default.aspx. The proposed project includes improvements to an existing transportation facility and the construction of the project is not expected to stimulate secondary growth, affect land use decisions, or induce land use change. Therefore, the project is not expected to result in light pollution impacts that are significantly worse than conditions currently present within the project area. The lighting layout for the roundabout will be developed during final design. The lighting will be designed to attempt to minimize light pollution while maintaining FHWA and WVDOH standards and requirements for lighting of the roundabout.

261	That is correct. A no-build alternative was also evaluated. Adding only left turn lanes on Greenbag Road at the Dorsey/Kingwood Pike intersection was evaluated during an initial round of traffic analysis because this option had been suggested by the MPO. The option included upgrading the signal lights to have a protected/permissive left turn phase. The analysis showed that this option would result in some intersection improvements but could not achieve LOS C or better for the overall intersection operation. The overall intersection would operate at an unacceptable LOS (LOS E or F). The eastbound Greenbag Road traffic queue would extend past the Bluegrass Village Driveway. Based on these findings this option was replaced with Options D and E for the EA analysis.
262	During the September 29, 2020 virtual public meeting, the WVDOH personnel mentioned during each presentation that live phone calls would not be taken. However, there was a “leave a voicemail” option to leave a message which would be transcribed. Any questions would be read, and comments would become part of the project record.
263	This comment is noted.
264	The WVDOH has held two public meetings for the Greenbag Road Improvement project. The first meeting was held in April 2019 at South Middle School. This second public meeting was held virtually based on the public health concerns related to the COVID-19 pandemic. The virtual meeting was advertised in the WV legal ads, on a message board in the project area, and through the Morgantown Monongalia MPO. Emails were sent to all commenters from the April 2019 meeting who had provided a valid email address and postcards were mailed to all commenters from the April 2019 meeting who had provided a complete mailing address. All questions and comments submitted during the public comment period are included in this comment summary with responses.
265	The chat window was available on the project's public input website during the virtual public meeting on September 29, 2020 from 5 to 8 pm.
266	Any property needed for the project will be acquired under the Uniform Relocation Assistance and Real Property Acquisition Act (1970) through negotiations with the landowners.
267	During the September 29, 2020 virtual public meeting, the WVDOH personnel mentioned during each presentation that live phone calls would not be taken. However, there was a “leave a voicemail” option to leave a message which would be transcribed. Any questions would be read, and comments would become part of the project record.
268	During the September 29, 2020 virtual public meeting, the WVDOH personnel mentioned during each presentation that live phone calls would not be taken. However, there was a “leave a voicemail” option to leave a message which would be transcribed. Any questions would be read, and comments would become part of the project record.
269	The preferred alternative includes the construction of another retaining wall at the intersection of Kingwood Pike and Greenbag Road.
270	One of the major differences between Greenbag Road and the Mileground, is the volume of traffic. Greenbag Road has less than half the traffic volume that Mileground has. A second major difference is the general configuration of the roundabouts. The proposed roundabouts on

	Greenbag are more straightforward and more traditional roundabout designs, without all of the confusing lanes that are present at Mileground. The roundabouts on Greenbag Road will be more intuitive for drivers. The roundabouts were designed to accommodate AASHTO WB-62 truck configuration, which is an interstate semi-truck with a 62' wheel base between steer axle and last trailer axle, including a 48' trailer. Larger trucks can navigate the roundabout and use the internal truck apron. The WVDOH has an educational video on how to use a roundabout available for viewing at https://www.youtube.com/watch?v=7njH4MKyo0w. Conscious Harvest Cooperative Community Garden, Joy and Hemp Universal LLC, and Mockingbird Hill Farms are located on private property and the property owner will be compensated for the sale of any land to the WVDOH during the right-of-way acquisition process. Impacts to this parcel have been minimized to the extent practicable. Approximately 1.56 acres (67,900 square feet) will be required from the parcel. Fair market value will be paid for all properties that require full or partial acquisition as a result of the project. When only part of the property is required, as is the case with this parcel, fair market value of the part taken will be paid, plus damages, if any, to the residue, less all benefits. West Virginia law defines "market value" as the price a willing buyer would pay a willing seller, neither acting under compulsion nor duress, both exercising prudence and intelligent judgment as to its value and familiar with the purpose for which the property is reasonably available. Fair market value will be determined by a competent, professional real estate appraiser after a thorough inspection of the property, a comparison with similar properties in the area that have been sold recently, a determination and consideration of its replacement cost and depreciation and consideration of the income-producing potential. All appraisal reports are office-reviewed, then rechecked in the field by experienced, qualified review appraisers for accuracy. Since the Division of Highways has adopted a firm price policy, the property owner will be offered the full amount of the approved appraisal. There will be no attempt to buy property at less than fair market value. This policy guarantees that all citizens of the state receive full value for the money expended for highway rights of way. Those who hold a valid property interest in the property that is acquired for the project will be compensated during the ROW acquisition phase. Moving the intersection to the north into the former Atomic Grill location is not feasible given the topography and approach angles.
271	The presentation was pre-recorded. The question and answer period was completed live during the virtual meeting.
272	The comment is noted.
273	Post construction surveys of roundabouts in Morgantown have not been conducted. Roundabouts are designed to maintain a constant flow of traffic through the intersection which results in reduced congestion on roadways and a reduction in delays for drivers. Studies have shown that changing signalized intersections to roundabouts can have up to an 89% average reduction in vehicle delays. The improved traffic flow also results in reduced vehicle emissions including carbon monoxide, nitrous oxide, and carbon dioxide at the intersection. One of the major differences between Greenbag Road and the Mileground, is the volume of traffic. Greenbag Road has less than half the traffic volume that Mileground has. A second major difference is the general configuration of the roundabouts. The proposed roundabouts on

	Greenbag are more straightforward and more traditional roundabout designs, without all of the confusing lanes that are present at Mileground. The roundabouts on Greenbag Road will be more intuitive for drivers. Every roundabout is designed and adapted to the context of its location.
274	The estimated construction cost for the Preferred Alternative with Intersection options C at Mississippi Street and F at Dorsey Avenue/Kingwood Pike is $10,429,195.49. Funding for the project will include both State and Federal highway funds.
275	The FHWA approved the use of a virtual public meeting based on the public health concerns related to the COVID-19 pandemic. The virtual public meeting provided a presentation of the Environmental Assessment. There were multiple ways to submit comments and questions during the meeting and throughout the 60-day comment period that followed.
276	This comment was addressed directly with the commenter during the public meeting.
277	Conscious Harvest Cooperative Community Garden, Joy and Hemp Universal LLC, and Mockingbird Hill Farms are located on private property and the property owner will be compensated for the sale of any land to the WVDOH during the right-of-way acquisition process. Impacts to this parcel have been minimized to the extent practicable. Approximately 1.56 acres (67,900 square feet) will be required from the parcel. Fair market value will be paid for all properties that require full or partial acquisition as a result of the project. When only part of the property is required, as is the case with this parcel, fair market value of the part taken will be paid, plus damages, if any, to the residue, less all benefits. West Virginia law defines “market value” as the price a willing buyer would pay a willing seller, neither acting under compulsion nor duress, both exercising prudence and intelligent judgment as to its value and familiar with the purpose for which the property is reasonably available. Fair market value will be determined by a competent, professional real estate appraiser after a thorough inspection of the property, a comparison with similar properties in the area that have been sold recently, a determination and consideration of its replacement cost and depreciation and consideration of the income-producing potential. All appraisal reports are office-reviewed, then rechecked in the field by experienced, qualified review appraisers for accuracy. Since the Division of Highways has adopted a firm price policy, the property owner will be offered the full amount of the approved appraisal. There will be no attempt to buy property at less than fair market value. This policy guarantees that all citizens of the state receive full value for the money expended for highway rights of way. Those who hold a valid property interest in the property that is acquired for the project will be compensated during the ROW acquisition phase.
278	Both the MMMPO corridor study and the 2018 traffic study determined that traffic flow through the corridor is controlled by the congestion at the major intersections in the corridor. The projected growth in the Morgantown area will continue to increase traffic and congestion at the intersections if improvements do not occur. The preliminary investigation and engineering traffic study has examined two build alternatives and three options for each of the major intersections. The intersection options that were evaluated and analyzed include turning lanes, traffic signals, and roundabouts. WVDOH requires intersection improvements to meet or exceed an overall intersection LOS C or better during the peak hours studied for design year

	improvements. The times of day (peak hours) selected to be studied followed WVDOH guidelines and is standard traffic engineering practice for determining future intersection improvements. At the intersection of Greenbag Road/Dorsey Avenue/Kingwood Pike the traffic analysis determined that the intersection would operate at failure (overall intersection LOS F) if existing intersection conditions and operations were to remain the same 30-years in the future (design year) without any improvements. Adding only left turn lanes on Greenbag Road at the Dorsey/Kingwood Pike intersection was evaluated during an initial round of traffic analysis because this option had been suggested by the MPO. The option included upgrading the signal lights to have a protected/permissive left turn phase. The analysis showed that this option would result in some intersection improvements but could not achieve LOS C or better for the overall intersection operation. The overall intersection would operate at an unacceptable LOS (LOS E). In addition, the left turn lane option would result in the eastbound Greenbag Road traffic queue to extend past the Bluegrass Village Driveway. The traffic analysis determined that with installation of a roundabout the overall intersection would operate at a LOS C, meeting WVDOH design year criteria. At the intersection of Greenbag Road/Mississippi Avenue the traffic analysis determined that the intersection would operate at failure (overall intersection LOS F) if existing intersection conditions and operations were to remain the same 30-years in the future (design year) without any improvements. The design year with improvements scenarios evaluated determined that with installation of a roundabout the overall intersection would operate at a LOS A, best operating conditions, for all peak hours studied. Installation of a traffic signal with turn lanes resulted in an overall intersection LOS B during the AM peak hour, with the Mississippi Avenue approach operating at a LOS C. Though the analysis meets WVDOH minimum LOS criteria, the roundabout option exceeds WVDOH minimum LOS criteria. Roundabouts help reduce vehicular delay and promotes a continuous flow of traffic, which increases traffic capacity at an intersection. Conscious Harvest Cooperative Community Garden, Joy and Hemp Universal LLC, and Mockingbird Hill Farms are located on private property and the property owner will be compensated for the sale of any land to the WVDOH during the right-of-way acquisition process. Impacts to this parcel have been minimized to the extent practicable. Approximately 1.56 acres (67,900 square feet) will be required from the parcel. Fair market value will be paid for all properties that require full or partial acquisition as a result of the project. When only part of the property is required, as is the case with this parcel, fair market value of the part taken will be paid, plus damages, if any, to the residue, less all benefits. West Virginia law defines “market value” as the price a willing buyer would pay a willing seller, neither acting under compulsion nor duress, both exercising prudence and intelligent judgment as to its value and familiar with the purpose for which the property is reasonably available. Fair market value will be determined by a competent, professional real estate appraiser after a thorough inspection of the property, a comparison with similar properties in the area that have been sold recently, a determination and consideration of its replacement cost and depreciation and consideration of the income-producing potential. All appraisal reports are office-reviewed, then rechecked in the field by experienced, qualified review appraisers for accuracy. Since the Division of Highways has adopted a firm price policy, the property owner will be offered the full amount of the approved appraisal. There will be no attempt to buy property at less than fair market value. This policy guarantees that all citizens of the state receive full value for the money expended for highway rights of way. Those who hold a valid property interest in the property that is acquired for the project will be compensated during the ROW acquisition phase.

279	During the September 29, 2020 virtual public meeting, the WVDOH personnel mentioned during each presentation that live phone calls would not be taken. However, there is "leave a voicemail" option those would be transcribed. Any questions would be read, and comments would become part of the project record.
280	The virtual public meeting took place from 5 to 8 pm on September 29, 2020. The presidential debate began at 9 pm.
281	The cultural resources surveys were conducted according to the guidelines published by the WV State Historic Preservation Office. The archaeological survey included the excavation of 213 shovel test pits, one test excavation unit, and visual inspection of the entire surface area within the defined area of potential effect. Based on the SHPO guidelines, when no cultural resources are identified during the Phase I survey, an abbreviated technical report is acceptable. As the reviewing agency, the WV SHPO concurred with the recommendation that no further archaeological investigations were warranted and no archaeological historic properties are present in the study area. The historic structures survey resulted in the identification of 25 structures 45+ years old within the defined area of potential effect. Two of the resources were recommended eligible for the National Register of Historic Places and the project was designed to avoid potential impacts to these properties. As the reviewing agency, the WV SHPO concurred with the recommendation that the project would not adversely affect any NRHP eligible resources and that no further historic structures investigations were needed. The cultural resources reports are available as an Appendix to the EA on the WVDOH website at https://transportation.wv.gov/highways/engineering/comment/closed/greenbagroadimprovementproject/Pages/default.aspx
282	The traffic control plan will continue to be revised during final design, and will not use Aaron's Creek Road as a signed detour. The revised plan intends to utilize the center of the Dorsey/Kingwood roundabout as a temporary intersection with temporary traffic signals. A short-term detour is proposed using Summers School Road while constructing the connection of the existing Kingwood Pike with the new portion.
283	Conscious Harvest Cooperative Community Garden, Joy and Hemp Universal LLC, and Mockingbird Hill Farms are located on private property and the property owner will be compensated for the sale of any land to the WVDOH during the right-of-way acquisition process. Impacts to this parcel have been minimized to the extent practicable. Approximately 1.56 acres (67,900 square feet) will be required from the parcel. Fair market value will be paid for all properties that require full or partial acquisition as a result of the project. When only part of the property is required, as is the case with this parcel, fair market value of the part taken will be paid, plus damages, if any, to the residue, less all benefits. West Virginia law defines "market value" as the price a willing buyer would pay a willing seller, neither acting under compulsion nor duress, both exercising prudence and intelligent judgment as to its value and familiar with the purpose for which the property is reasonably available. Fair market value will be determined by a competent, professional real estate appraiser after a thorough inspection of the property, a comparison with similar properties in the area that have been sold recently, a determination and consideration of its replacement cost and depreciation and consideration of the income-producing potential. All appraisal reports are office-reviewed, then rechecked in the field by experienced, qualified review appraisers for accuracy. Since the Division of Highways has adopted a firm price policy, the property owner will be offered the full amount of the approved appraisal. There will be no attempt to buy property at less than fair market value. This policy guarantees that all citizens of the state receive full value for the money expended for highway rights of way.

	Those who hold a valid property interest in the property that is acquired for the project will be compensated during the ROW acquisition phase.
284	The turn lane options that were examined do not improve the level of service as much as the roundabout and the turn lanes at Dorsey Avenue/Kingwood Pike involve complete takes of 2 residences and 1 business. These takes are different from what was reported in the EA. This change will be noted in the FONSI. Adding only left turn lanes on Greenbag Road at the Dorsey/Kingwood Pike intersection was evaluated during an initial round of traffic analysis because this option had been suggested by the MPO. The option included upgrading the signal lights to have a protected/permissive left turn phase. The analysis showed that this option would result in some intersection improvements but could not achieve LOS C or better for the overall intersection operation. The overall intersection would operate at an unacceptable LOS (LOS E or F). The eastbound Greenbag Road traffic queue would extend past the Bluegrass Village Driveway. Based on these findings this option was replaced with Options D and E for the EA analysis. Sidewalks are included in both of the build alternatives considered.
285	Conscious Harvest Cooperative Community Garden, Joy and Hemp Universal LLC, and Mockingbird Hill Farms are located on private property and the property owner will be compensated for the sale of any land to the WVDOH during the right-of-way acquisition process. Impacts to this parcel have been minimized to the extent practicable. Approximately 1.56 acres (67,900 square feet) will be required from the parcel. Fair market value will be paid for all properties that require full or partial acquisition as a result of the project. When only part of the property is required, as is the case with this parcel, fair market value of the part taken will be paid, plus damages, if any, to the residue, less all benefits. West Virginia law defines “market value” as the price a willing buyer would pay a willing seller, neither acting under compulsion nor duress, both exercising prudence and intelligent judgment as to its value and familiar with the purpose for which the property is reasonably available. Fair market value will be determined by a competent, professional real estate appraiser after a thorough inspection of the property, a comparison with similar properties in the area that have been sold recently, a determination and consideration of its replacement cost and depreciation and consideration of the income-producing potential. All appraisal reports are office-reviewed, then rechecked in the field by experienced, qualified review appraisers for accuracy. Since the Division of Highways has adopted a firm price policy, the property owner will be offered the full amount of the approved appraisal. There will be no attempt to buy property at less than fair market value. This policy guarantees that all citizens of the state receive full value for the money expended for highway rights of way. Those who hold a valid property interest in the property that is acquired for the project will be compensated during the ROW acquisition phase.
286	Any resources that may require reevaluation will be readdressed and any changes will be noted in the FONSI. Please refer to the EA Appendix for more information on the studies that have been conducted through project development (https://transportation.wv.gov/highways/engineering/comment/closed/greenbagroadimprovementproject/Pages/default.aspx.).
287	The traffic control plan will continue to be revised during final design, and will not use Aaron’s Creek Road as a signed detour. The revised plan intends to utilize the center of the Dorsey/Kingwood roundabout as a temporary intersection with temporary traffic signals. A short-term detour is proposed using Summers School Road while constructing the connection of the existing Kingwood Pike with the new portion.
288	The turn lane options that were examined do not improve the level of service as much as the roundabout at the intersection of Dorsey Avenue/Kingwood Pike. In addition, the turn lane option involves complete takes of 2 residences and 1 business. These takes are different from

	what was reported in the EA. This change will be noted in the FONSI. Adding only left turn lanes on Greenbag Road at the Dorsey/Kingwood Pike intersection was evaluated during an initial round of traffic analysis because this option had been suggested by the MPO. The option included upgrading the signal lights to have a protected/permissive left turn phase. The analysis showed that this option would result in some intersection improvements but could not achieve LOS C or better for the overall intersection operation. It should be noted that LOS C is WVDOH's design year level of service criteria threshold for intersection improvements. The overall intersection would operate at an unacceptable level of service (LOS E). In addition, the left turn lane option would result in the eastbound Greenbag Road traffic queue to extend past the Bluegrass Village Driveway. Conscious Harvest Cooperative Community Garden, Joy and Hemp Universal LLC, and Mockingbird Hill Farms are located on private property and the property owner will be compensated for the sale of any land to the WVDOH during the right-of-way acquisition process. Impacts to this parcel have been minimized to the extent practicable. Approximately 1.56 acres (67,900 square feet) will be required from the parcel. Fair market value will be paid for all properties that require full or partial acquisition as a result of the project. When only part of the property is required, as is the case with this parcel, fair market value of the part taken will be paid, plus damages, if any, to the residue, less all benefits. West Virginia law defines "market value" as the price a willing buyer would pay a willing seller, neither acting under compulsion nor duress, both exercising prudence and intelligent judgment as to its value and familiar with the purpose for which the property is reasonably available. Fair market value will be determined by a competent, professional real estate appraiser after a thorough inspection of the property, a comparison with similar properties in the area that have been sold recently, a determination and consideration of its replacement cost and depreciation and consideration of the income-producing potential. All appraisal reports are office-reviewed, then rechecked in the field by experienced, qualified review appraisers for accuracy. Since the Division of Highways has adopted a firm price policy, the property owner will be offered the full amount of the approved appraisal. There will be no attempt to buy property at less than fair market value. This policy guarantees that all citizens of the state receive full value for the money expended for highway rights of way. Those who hold a valid property interest in the property that is acquired for the project will be compensated during the ROW acquisition phase.
289	During the September 29, 2020 virtual public meeting, the WVDOH personnel mentioned during each presentation that live phone calls would not be taken. However, there is "leave a voicemail" option those would be transcribed. Any questions would be read, and comments would become part of the project record.
290	Conscious Harvest Cooperative Community Garden, Joy and Hemp Universal LLC, and Mockingbird Hill Farms are located on private property and the property owner will be compensated for the sale of any land to the WVDOH during the right-of-way acquisition process. Impacts to this parcel have been minimized to the extent practicable. Approximately 1.56 acres (67,900 square feet) will be required from the parcel. Fair market value will be paid for all properties that require full or partial acquisition as a result of the project. When only part of the property is required, as is the case with this parcel, fair market value of the part taken will be paid, plus damages, if any, to the residue, less all benefits. West Virginia law defines "market value" as the price a willing buyer would pay a willing seller, neither acting under compulsion nor duress, both exercising prudence and intelligent judgment as to its value and familiar with the purpose for which the property is reasonably available. Fair market value will be determined by a competent, professional real estate appraiser after a thorough inspection of the property, a comparison

	with similar properties in the area that have been sold recently, a determination and consideration of its replacement cost and depreciation and consideration of the income-producing potential. All appraisal reports are office-reviewed, then rechecked in the field by experienced, qualified review appraisers for accuracy. Since the Division of Highways has adopted a firm price policy, the property owner will be offered the full amount of the approved appraisal. There will be no attempt to buy property at less than fair market value. This policy guarantees that all citizens of the state receive full value for the money expended for highway rights of way. Those who hold a valid property interest in the property that is acquired for the project will be compensated during the ROW acquisition phase.
291	The West Virginia Division of Natural Resources and the US Fish and Wildlife Service both reviewed the project area and there were no endangered falcons identified within the project area. The WVDNR requested a mussel survey if in-stream work is anticipated in Cobun Creek and a spawning waiver if work will occur between April 1 and June 30. WVDOH environmental staff completed mussel and eagle nest surveys on July 22, 2019. No mussels or eagle nests were observed within the Project area. The USFWS reviewed the Project and determined "this project is not likely to adversely affect the Indiana bat." The USFWS also states that "the proposed project … will not affect any known Northern Long Eared Bat (NLEB) hibernacula … and no conservation measures are required." The EA analysis included evaluation of potential impacts to numerous categories including natural resources, cultural resources, land use, indirect, and cumulative effects in accordance with NEPA. Findings from the Environmental studies (aquatic resources such as streams and wetlands; rare, threatened and endangered species of plants and animals; floodplains; farmlands; groundwater; hazardous materials; air quality; and noise) that were conducted to evaluate impacts associated with the proposed project are documented in the EA. More information is available in the EA appendices. The EA and appendices are available on the WVDOH website at https://transportation.wv.gov/highways/engineering/comment/closed/greenbagroadimprovementproject/Pages/default.aspx.
292	Conscious Harvest Cooperative Community Garden, Joy and Hemp Universal LLC, and Mockingbird Hill Farms are located on private property and the property owner will be compensated for the sale of any land to the WVDOH during the right-of-way acquisition process. Impacts to this parcel have been minimized to the extent practicable. Approximately 1.56 acres (67,900 square feet) will be required from the parcel. Fair market value will be paid for all properties that require full or partial acquisition as a result of the project. When only part of the property is required, as is the case with this parcel, fair market value of the part taken will be paid, plus damages, if any, to the residue, less all benefits. West Virginia law defines "market value" as the price a willing buyer would pay a willing seller, neither acting under compulsion nor duress, both exercising prudence and intelligent judgment as to its value and familiar with the purpose for which the property is reasonably available. Fair market value will be determined by a competent, professional real estate appraiser after a thorough inspection of the property, a comparison with similar properties in the area that have been sold recently, a determination and consideration of its replacement cost and depreciation and consideration of the income-producing potential. All appraisal reports are office-reviewed, then rechecked in the field by experienced, qualified review appraisers for accuracy. Since the Division of Highways has adopted a firm price policy, the property owner will be offered the full amount of the approved appraisal. There will be no attempt to buy property at less than fair market value. This policy guarantees that all citizens of the state receive full value for the money expended for highway rights of way.

	Those who hold a valid property interest in the property that is acquired for the project will be compensated during the ROW acquisition phase.
293	The EA reported impacts to Federal Farmland Protection Policy Act (FPPA) soils. The entire Greenbag Road environmental study area is encompassed by "land already in or committed to urban development" as defined by the FPPA (see 7 CFR § 658.2 - Definitions) and is therefore not subject to provisions of FPPA. Please refer to the Farmland Appendix attached to the FONSI for further detail. Conscious Harvest Cooperative Community Garden, Joy and Hemp Universal LLC, and Mockingbird Hill Farms are located on private property and the property owner will be compensated for the sale of any land to the WVDOH during the right-of-way acquisition process. Impacts to this parcel have been minimized to the extent practicable. Approximately 1.56 acres (67,900 square feet) will be required from the parcel. Fair market value will be paid for all properties that require full or partial acquisition as a result of the project. When only part of the property is required, as is the case with this parcel, fair market value of the part taken will be paid, plus damages, if any, to the residue, less all benefits. West Virginia law defines "market value" as the price a willing buyer would pay a willing seller, neither acting under compulsion nor duress, both exercising prudence and intelligent judgment as to its value and familiar with the purpose for which the property is reasonably available. Fair market value will be determined by a competent, professional real estate appraiser after a thorough inspection of the property, a comparison with similar properties in the area that have been sold recently, a determination and consideration of its replacement cost and depreciation and consideration of the income-producing potential. All appraisal reports are office-reviewed, then rechecked in the field by experienced, qualified review appraisers for accuracy. Since the Division of Highways has adopted a firm price policy, the property owner will be offered the full amount of the approved appraisal. There will be no attempt to buy property at less than fair market value. This policy guarantees that all citizens of the state receive full value for the money expended for highway rights of way. Those who hold a valid property interest in the property that is acquired for the project will be compensated during the ROW acquisition phase.
294	The comment is noted.
295	The turn lane options that were examined do not improve the level of service as much as the roundabout and the turn lanes at Dorsey Avenue/Kingwood Pike involve complete takes of 2 residences and 1 business. These takes are different from what was reported in the EA. This change will be noted in the FONSI. Adding only left turn lanes on Greenbag Road at the Dorsey/Kingwood Pike intersection was evaluated during an initial round of traffic analysis because this option had been suggested by the MPO. The option included upgrading the signal lights to have a protected/permissive left turn phase. The analysis showed that this option would result in some intersection improvements but could not achieve LOS C or better for the overall intersection operation. The overall intersection would operate at an unacceptable LOS (LOS E or F). The eastbound Greenbag Road traffic queue would extend past the Bluegrass Village Driveway. Based on these findings this option was replaced with Options D and E for the EA analysis.
296	The Environmental Assessment was approved by Federal Highway Administration on August 28, 2020.
297	The Environmental Assessment was approved by Federal Highway Administration on August 28, 2020.

298	This comment is noted.
299	Adding only left turn lanes on Greenbag Road at the Dorsey/Kingwood Pike intersection was evaluated during an initial round of traffic analysis because this option had been suggested by the MPO. The option included upgrading the signal lights to have a protected/permissive left turn phase. The analysis showed that this option would result in some intersection improvements but could not achieve LOS C or better for the overall intersection operation. The overall intersection would operate at an unacceptable LOS (LOS E or F). The eastbound Greenbag Road traffic queue would extend past the Bluegrass Village Driveway. Based on these findings this option was replaced with Options D and E for the EA analysis.
300	Roundabouts help reduce the likelihood and severity of collisions. Studies by the Federal Highway Administration (FHWA) have shown that roundabouts typically achieve reduction in overall collisions, injury collisions, fatality collisions, and pedestrian collisions. Reasons for these reductions due to the installation of a roundabout include: Low travel speeds – Drivers must slow down and yield to traffic before entering a roundabout. The reduction in speeds results in a decrease in crash severity and injury. No traffic light "to beat" – The design of a roundabout promotes a continuous circular flow of traffic. Because of this design, drivers will not have the incentive to speed up to "beat the light", like they may at a traditional intersection. One way travel – The design of a roundabout directs drivers through gently designed curves into a one-way counterclockwise circular path. This design eliminates the possibilities for T-bone and head-on collisions. In addition, a conventional 4-way intersection has 32 points of vehicle conflict due to the different maneuvers through the intersection. A roundabout has 8 points of conflict, which all occur in the same direction, reducing crash severity and likelihood of injury. The WVDOH has an educational video on how to use a roundabout available for viewing at https://www.youtube.com/watch?v=7njH4MKyo0w.
301	The roundabouts were designed to accommodate AASHTO WB-62 truck configuration, which is an interstate semi-truck with a 62' wheel base between steer axle and last trailer axle, including a 48' trailer. Larger trucks can navigate the roundabout and use the internal truck apron.
302	The traffic control plan will continue to be revised during final design, and will not use Aaron's Creek Road as a signed detour. The revised plan intends to utilize the center of the Dorsey/Kingwood roundabout as a temporary intersection with temporary traffic signals. A short-term detour is proposed using Summers School Road while constructing the connection of the existing Kingwood Pike with the new portion. The turn lane options that were examined do not improve the level of service as much as the roundabout and the turn lanes at Dorsey Avenue/Kingwood Pike involve complete takes of 2 residences and 1 business. These takes are different from what was reported in the EA. This change will be noted in the FONSI. Adding only left turn lanes on Greenbag Road at the Dorsey/Kingwood Pike intersection was evaluated during an initial round of traffic analysis because this option had been suggested by the MPO. The option included upgrading the signal lights to have a protected/permissive left turn phase. The analysis showed that this option would result in some intersection improvements but could not

	achieve LOS C or better for the overall intersection operation. The overall intersection would operate at an unacceptable LOS (LOS E or F). The eastbound Greenbag Road traffic queue would extend past the Bluegrass Village Driveway. Based on these findings this option was replaced with Options D and E for the EA analysis. Sidewalks are included in both of the build alternatives considered. The WVDOH developed this project based on recommendations from the preliminary study that was completed by the MMMPO and documented in the Greenbag Road Corridor Study. The MMMPO had completed several previous studies evaluating various transportation plans for the Greenbag Road corridor, with the ultimate vision of transforming Greenbag Road into a safe, efficient, and attractive multimodal transportation facility.
303	The traffic control plan will continue to be revised during final design, and will not use Aaron's Creek Road as a signed detour. The revised plan intends to utilize the center of the Dorsey/Kingwood roundabout as a temporary intersection with temporary traffic signals. A short-term detour is proposed using Summers School Road while constructing the connection of the existing Kingwood Pike with the new portion.
304	We appreciate your input regarding the project.
305	Conscious Harvest Cooperative Community Garden, Joy and Hemp Universal LLC, and Mockingbird Hill Farms are located on private property and the property owner will be compensated for the sale of any land to the WVDOH during the right-of-way acquisition process. Impacts to this parcel have been minimized to the extent practicable. Approximately 1.56 acres (67,900 square feet) will be required from the parcel. Fair market value will be paid for all properties that require full or partial acquisition as a result of the project. When only part of the property is required, as is the case with this parcel, fair market value of the part taken will be paid, plus damages, if any, to the residue, less all benefits. West Virginia law defines "market value" as the price a willing buyer would pay a willing seller, neither acting under compulsion nor duress, both exercising prudence and intelligent judgment as to its value and familiar with the purpose for which the property is reasonably available. Fair market value will be determined by a competent, professional real estate appraiser after a thorough inspection of the property, a comparison with similar properties in the area that have been sold recently, a determination and consideration of its replacement cost and depreciation and consideration of the income-producing potential. All appraisal reports are office-reviewed, then rechecked in the field by experienced, qualified review appraisers for accuracy. Since the Division of Highways has adopted a firm price policy, the property owner will be offered the full amount of the approved appraisal. There will be no attempt to buy property at less than fair market value. This policy guarantees that all citizens of the state receive full value for the money expended for highway rights of way. Those who hold a valid property interest in the property that is acquired for the project will be compensated during the ROW acquisition phase.
306	We appreciate your input regarding the project.
307	The cultural resources surveys were conducted according to the guidelines published by the WV State Historic Preservation Office. The archaeological survey included the excavation of 213 shovel test pits, one test excavation unit, and visual inspection of the entire surface area within the defined area of potential effect. Based on the SHPO guidelines, when no cultural resources are identified during the Phase I survey, an abbreviated technical report is acceptable. As the reviewing agency, the WV SHPO concurred with the recommendation that no further

	archaeological investigations were warranted and no archaeological historic properties are present in the study area. The historic structures survey resulted in the identification of 25 structures 45+ years old within the defined area of potential effect. Two of the resources were recommended eligible for the National Register of Historic Places and the project was designed to avoid potential impacts to these properties. As the reviewing agency, the WV SHPO concurred with the recommendation that the project would not adversely affect any NRHP eligible resources and that no further historic structures investigations were needed.
308	The virtual meeting was advertised in the WV legal ads, on a message board in the project area, and through the Morgantown Monongalia MPO. Emails were sent to all commenters from the April 2019 meeting who had provided a valid email address and postcards were mailed to all commenters from the April 2019 meeting who had provided a complete mailing address. Written comments submitted following the April 2019 public meeting were included in the final Environmental Assessment, approved by FHWA on August 28, 2020. The final design will factor the geotechnical information needed to design the retaining wall and prevent further damage. Drainage issues within the project footprint will be further evaluated and addressed during final design for the project. Access to your property will be maintained during and after construction. The WVDOH will coordinate with all utility companies within the project area to relocate any utility lines which would be impacted by the project construction. Any property needed for the project will be acquired under the Uniform Relocation Assistance and Real Property Acquisition Act (1970) through negotiations with the landowner and will be compensated at fair market value of the part taken, plus damages, if any, to the residue, less all benefits. When only part of the property is required, as is the case with this parcel, fair market value of the part taken will be paid, plus damages, if any, to the residue, less all benefits. West Virginia law defines “market value” as the price a willing buyer would pay a willing seller, neither acting under compulsion nor duress, both exercising prudence and intelligent judgment as to its value and familiar with the purpose for which the property is reasonably available. Fair market value will be determined by a competent, professional real estate appraiser after a thorough inspection of the property, a comparison with similar properties in the area that have been sold recently, a determination and consideration of its replacement cost and depreciation and consideration of the income-producing potential. All appraisal reports are office-reviewed, then rechecked in the field by experienced, qualified review appraisers for accuracy. Since the Division of Highways has adopted a firm price policy, the property owner will be offered the full amount of the approved appraisal. There will be no attempt to buy property at less than fair market value. This policy guarantees that all citizens of the state receive full value for the money expended for highway rights of way.
309	There was a list of frequently asked questions with WVDOH responses on the website as well. The public was also informed during the public meeting that there would be a meeting summary included in the final environmental document.

310	We appreciate your understanding during the transition to the virtual meeting format and apologize for any technical difficulties. Opportunities for commenting were provided during the live public meeting, and after the meeting via the WVDOH website, email or by mail to the WVDOH. The public comment period was available beginning on September 29 and ending on November 30, 2020.
311	Road repair beyond the scope of this project is being addressed through the Governor's Roads to Prosperity program and progress can be tracked via the WVDOH website.
312	We appreciate your understanding during the transition to the virtual meeting format and apologize for any technical difficulties.
313	The virtual meeting was advertised in the WV legal ads, on a message board in the project area, and through the Morgantown Monongalia MPO. Emails were sent to all commenters from the April 2019 meeting who had provided a valid email address and postcards were mailed to all commenters from the April 2019 meeting who had provided a complete mailing address. The public comment period was extended from the standard 30-day period to 60 days in order to accommodate additional input by the community.
314	Federal regulations require that projects take into account any effects to cultural properties. The entire environmental study area for the proposed project was assessed in 2019 to evaluate the presence of cultural properties, and findings were documented in accordance with Section 106 of the National Historic Preservation Act. The Historic Structures survey identified 25 resources that are greater than 45 years old. Two resources were recommended as eligible for the National Register of Historic Places: The Campbell Farmhouse and the prison complex. As the reviewing agency, the WV SHPO concurred with the recommendation that the project would not adversely affect any NRHP eligible resources and that no further historic structures investigations were needed. More information is available in the EA appendices. The EA and appendices are available on the WVDOH website at https://transportation.wv.gov/highways/engineering/comment/closed/greenbagroadimprovementproject/Pages/default.aspx.
315	We appreciate your understanding during the transition to the virtual meeting format and apologize for any technical difficulties.
316	Conscious Harvest Cooperative Community Garden, Joy and Hemp Universal LLC, and Mockingbird Hill Farms are located on private property and the property owner will be compensated for the sale of any land to the WVDOH during the right-of-way acquisition process. Impacts to this parcel have been minimized to the extent practicable. Approximately 1.56 acres (67,900 square feet) will be required from the parcel. Fair market value will be paid for all properties that require full or partial acquisition as a result of the project. When only part of the property is required, as is the case with this parcel, fair market value of the part taken will be paid, plus damages, if any, to the residue, less all benefits. West Virginia law defines “market value” as the price a willing buyer would pay a willing seller, neither acting under compulsion nor duress, both exercising prudence and intelligent judgment as to its value and familiar with the purpose for which the property is reasonably available. Fair market value will be determined by a competent, professional real estate appraiser after a thorough inspection of the property, a comparison with similar properties in the area that have been sold recently, a determination and consideration of its replacement cost and depreciation and consideration of the income-producing potential. All appraisal reports are office-reviewed, then rechecked in the field by experienced, qualified review appraisers for accuracy. Since the Division of Highways has adopted a firm price policy, the property owner will be offered the full

	amount of the approved appraisal. There will be no attempt to buy property at less than fair market value. This policy guarantees that all citizens of the state receive full value for the money expended for highway rights of way. Those who hold a valid property interest in the property that is acquired for the project will be compensated during the ROW acquisition phase.
317	The Environmental Assessment was approved by Federal Highway Administration (FHWA) on August 28, 2020.
318	This is the preferred option driven by the NEPA process. More information is available in the EA appendices. The EA and appendices are available on the WVDOH website: https://transportation.wv.gov/highways/engineering/comment/closed/greenbagroadimprovementproject/Pages/default.aspx.
319	The sidewalk design has been extended from the western end of the project area along Greenbag Road to the Dorsey Avenue/Kingwood Pike intersection. At the intersection the sidewalk follows Dorsey Avenue north to Luckey Lane and east on Luckey Lane to the connection with the existing sidewalk at Mountainview Elementary School. The shoulder along the north side of Greenbag Road is being designed to accommodate bicycle use by being wider (3 feet) than the standard shoulder (2 feet).
320	We appreciate your input regarding the project.
321	Post construction surveys of roundabouts in Morgantown have not been conducted. The Insurance Institute for Highway Safety (IIHS) and the Federal Highway Administration (FHWA) have conducted studies on the benefits and effectiveness of roundabouts. Please refer to the IIHS's roundabout page (https://www.iihs.org/topics/roundabouts) and the FHWA's Roundabouts: An Informational Guide (https://www.fhwa.dot.gov/publications/research/safety/00067/00067.pdf) for more information. Roundabouts are designed to maintain a constant flow of traffic through the intersection which results in reduced congestion on roadways and a reduction in delays for drivers. Studies have shown that changing signalized intersections to roundabouts can have up to an 89% average reduction in vehicle delays. The improved traffic flow also results in reduced vehicle emissions including carbon monoxide, nitrous oxide, and carbon dioxide at the intersection. The proposed roundabouts on Greenbag are more straightforward and more traditional roundabout designs, without all of the confusing lanes that are sometimes present. The roundabouts on Greenbag Road will be more intuitive for drivers.
322	We appreciate your understanding during the transition to the virtual meeting format and apologize for any technical difficulties. More information is available in the EA alternatives analysis section with the impacts tables. The EA and appendices are available on the WVDOH website: https://transportation.wv.gov/highways/engineering/comment/closed/greenbagroadimprovementproject/Pages/default.aspx.
323	Due to the time constraints, general comments were not read aloud during the virtual public meeting held on September 29, 2020 from 5 to 8 pm. However, all comments and questions will be made part of the public record and become part of the final environmental clearance document. Questions posed by the public were read and answered during the virtual public meeting in order to provide information regarding the project to the community.

324	Post construction surveys of roundabouts in Morgantown have not been conducted. The Insurance Institute for Highway Safety (IIHS) and the Federal Highway Administration (FHWA) have conducted studies on the benefits and effectiveness of roundabouts. Please refer to the IIHS's roundabout page (https://www.iihs.org/topics/roundabouts) and the FHWA's Roundabouts: An Informational Guide (https://www.fhwa.dot.gov/publications/research/safety/00067/00067.pdf) for more information. Roundabouts are designed to maintain a constant flow of traffic through the intersection which results in reduced congestion on roadways and a reduction in delays for drivers. Studies have shown that changing signalized intersections to roundabouts can have up to an 89% average reduction in vehicle delays. The improved traffic flow also results in reduced vehicle emissions including carbon monoxide, nitrous oxide, and carbon dioxide at the intersection. The proposed roundabouts on Greenbag are more straightforward and more traditional roundabout designs, without all of the confusing lanes that are sometimes present. The roundabouts on Greenbag Road will be more intuitive for drivers.
325	Roundabouts are designed to slow speeds in the approach and through the roundabout allowing drivers more response time and limiting the number of potential directions where traffic could approach. Both of these factors improve safety for all drivers, including older drivers as well as pedestrians, and cyclists. Roundabouts are also designed to maintain a constant flow of traffic through the intersection which results in reduced congestion on roadways and a reduction in delays for drivers. Studies have shown that changing signalized intersections to roundabouts can have up to an 89% average reduction in vehicle delays. The improved traffic flow also results in reduced vehicle emissions including carbon monoxide, nitrous oxide, and carbon dioxide at the intersection.
326	The West Virginia Division of Natural Resources and the US Fish and Wildlife Service both reviewed the project area. The WVDNR requested a mussel survey if in-stream work is anticipated in Cobun Creek and a spawning waiver if work will occur between April 1 and June 30. WVDOH environmental staff completed mussel and eagle nest surveys on July 22, 2019. No mussels or eagle nests were observed within the Project area. The USFWS reviewed the Project and determined "this project is not likely to adversely affect the Indiana bat." The USFWS also states that "the proposed project … will not affect any known Northern Long Eared Bat (NLEB) hibernacula … and no conservation measures are required." More information is available in the EA appendices. The EA and appendices are available on the WVDOH website: https://transportation.wv.gov/highways/engineering/comment/closed/greenbagroadimprovementproject/Pages/default.aspx. One of the major differences between Greenbag Road and the Mileground, is the volume of traffic. Greenbag Road has less than half the traffic volume that Mileground has. A second major difference is the general configuration of the roundabouts. The proposed roundabouts on Greenbag are more straightforward and more traditional roundabout designs, without all of the confusing lanes that are present at Mileground. The roundabouts on Greenbag Road will be more intuitive for drivers. The sidewalk design has been extended from the western end of the project area along Greenbag Road to the Dorsey Avenue/Kingwood Pike intersection. At the intersection the sidewalk follows Dorsey Avenue north to Luckey Lane and east on Luckey Lane to the connection with the existing sidewalk at Mountainview Elementary School. The shoulder along the north side of Greenbag Road is being designed to accommodate bicycle use by being wider (3 feet) than the standard shoulder (2 feet). The option to add left turn lanes only on Greenbag Rd at the Dorsey/Kingwood Pike was one of the options suggested by the MMMPO study and was included on the first round of traffic analysis submitted to the WVDOH in February of 2019. This scenario also included upgrading the

	existing 2-phase traffic signal to 3-phases to incorporate a protected/permissive left turn phase. Installation of the turn lanes and modifying the signal phasing resulted in various approach and overall intersection LOS improvements; however, LOS C or better for the overall intersection operation could not be achieved. It was projected that some movements and the overall intersection would operate at an unacceptable level of service (LOS E or F). During the PM peak hour, the overall intersection is projected to operate at an overall intersection LOS E, and the eastbound through movement is forecasted to operate at a LOS F. This option would result in the Greenbag Road and Dorsey Avenue approaches queue lengths increasing. The eastbound Greenbag Road through movement queue will continue to extend past the Bluegrass Village driveway. Based on these findings and at the direction of the WVDOH, the traffic analysis was revised using additional options, which developed into Options D and E examined for the EA. The left turn lane only on Greenbag Road was not developed further and no impacts were assessed for the EA. The turn lane options that were examined in the EA do not improve the level of service as much as the roundabout and the turn lanes at Dorsey Avenue/Kingwood Pike involve complete takes of 2 residences and 1 business. These takes are different from what was reported in the EA. This change will be noted in the FONSI. The MMMPO had completed several previous studies evaluating various transportation plans for the Greenbag Road corridor, with the ultimate vision of transforming Greenbag Road into a safe, efficient, and attractive multimodal transportation facility. The scenarios determined to be evaluated in the traffic study evolved from the outcome of the MMMPO's preliminary studies and findings. Existing two-way stop controlled operations with potential roadway improvements were evaluated as part of the traffic, as well as traffic signal and roundabout options. The intersection of Greenbag Road/Dorsey Avenue/Kingwood Pike is currently controlled by a traffic signal and not by a four-way (all-way) stop, which includes stop sign control on each approach. The intersection would operate at failure (overall intersection LOS F) if existing intersection conditions and operations (traffic signal control) were to remain the same 30-years in the future (design year) without any improvements. Therefore, traffic analysis was not completed for a four-way (all-way) stop controlled intersection operations.
327	The existing grade on Kingwood Pike requires stopping on a -6.5% grade at the traffic signal. The grade approaching the roundabout includes a flat grade of less than 2% at the roundabout. In most cases, the roundabout will not require approaching traffic to come to a full or immediate stop, and does not queue traffic on the steep grade as the existing traffic signal does.
328	The comment is noted.
329	During the September 29, 2020 virtual public meeting, the WVDOH personnel mentioned during each presentation that live phone calls would not be taken. However, there was a "leave a voicemail" option those would be transcribed and included in the public record for the project.
330	The turn lane options that were examined do not improve the level of service as much as the roundabout and the turn lanes at Dorsey Avenue/Kingwood Pike involve complete takes of 2 residences and 1 business. These takes are different from what was reported in the EA. This change will be noted in the FONSI. Adding only left turn lanes on Greenbag Road at the Dorsey/Kingwood Pike intersection was evaluated during an initial round of traffic analysis because this option had been suggested by the MPO. The option included upgrading the signal lights to have a protected/permissive left turn phase. The analysis showed that this option would result in some intersection improvements but could not achieve LOS C or better for the overall intersection operation. The overall intersection would operate at an unacceptable LOS (LOS E or F).

	The eastbound Greenbag Road traffic queue would extend past the Bluegrass Village Driveway. Based on these findings this option was replaced with Options D and E for the EA analysis.
331	There has not been any formal public polling. Public comment periods have been available following both of the public meetings.
332	The preferred alternative is anticipated to require 1.5 to 2 construction seasons.
333	Conscious Harvest Cooperative Community Garden, Joy and Hemp Universal LLC, and Mockingbird Hill Farms are located on private property and the property owner will be compensated for the sale of any land to the WVDOH during the right-of-way acquisition process. Impacts to this parcel have been minimized to the extent practicable. Approximately 1.56 acres (67,900 square feet) will be required from the parcel. Fair market value will be paid for all properties that require full or partial acquisition as a result of the project. When only part of the property is required, as is the case with this parcel, fair market value of the part taken will be paid, plus damages, if any, to the residue, less all benefits. West Virginia law defines "market value" as the price a willing buyer would pay a willing seller, neither acting under compulsion nor duress, both exercising prudence and intelligent judgment as to its value and familiar with the purpose for which the property is reasonably available. Fair market value will be determined by a competent, professional real estate appraiser after a thorough inspection of the property, a comparison with similar properties in the area that have been sold recently, a determination and consideration of its replacement cost and depreciation and consideration of the income-producing potential. All appraisal reports are office-reviewed, then rechecked in the field by experienced, qualified review appraisers for accuracy. Since the Division of Highways has adopted a firm price policy, the property owner will be offered the full amount of the approved appraisal. There will be no attempt to buy property at less than fair market value. This policy guarantees that all citizens of the state receive full value for the money expended for highway rights of way. Those who hold a valid property interest in the property that is acquired for the project will be compensated during the ROW acquisition phase.
334	Conscious Harvest Cooperative Community Garden, Joy and Hemp Universal LLC, and Mockingbird Hill Farms are located on private property and the property owner will be compensated for the sale of any land to the WVDOH during the right-of-way acquisition process. Impacts to this parcel have been minimized to the extent practicable. Approximately 1.56 acres (67,900 square feet) will be required from the parcel. Since the Division of Highways has adopted a firm price policy, the property owner will be offered the full

	amount of the approved appraisal. There will be no attempt to buy property at less than fair market value. This policy guarantees that all citizens of the state receive full value for the money expended for highway rights of way. Those who hold a valid property interest in the property that is acquired for the project will be compensated during the ROW acquisition phase.
335	The turn lane options that were examined do not improve the level of service as much as the roundabout and the turn lanes at Dorsey Avenue/Kingwood Pike involve complete takes of 2 residences and 1 business. These takes are different from what was reported in the EA. This change will be noted in the FONSI. Adding only left turn lanes on Greenbag Road at the Dorsey/Kingwood Pike intersection was evaluated during an initial round of traffic analysis because this option had been suggested by the MPO. The option included upgrading the signal lights to have a protected/permissive left turn phase. The analysis showed that this option would result in some intersection improvements but could not achieve LOS C or better for the overall intersection operation. The overall intersection would operate at an unacceptable LOS (LOS E or F). The eastbound Greenbag Road traffic queue would extend past the Bluegrass Village Driveway. Based on these findings this option was replaced with Options D and E for the EA analysis. Sidewalks are included in both of the build alternatives considered.
336	We appreciate your input regarding the project.
337	We appreciate your input regarding the project.
338	We appreciate your understanding during the transition to the virtual meeting format and apologize for any technical difficulties.
339	This comment is noted.
340	The improvement to the level of service is calculated between the no build option and the selected alternative. Option F improves the level of service by three grade levels in the morning and afternoon time periods.
341	We appreciate your input regarding the project.
342	The archaeological survey was conducted according to the guidelines published by the WV State Historic Preservation Office Guidelines for Phase I, II, and III Archaeological Investigations and Technical Reports. The survey included the excavation of 213 shovel test pits, one test excavation unit, and visual inspection of the entire surface area within the defined area of potential effect. Based on the SHPO guidelines, when no cultural resources are identified during the Phase I survey, an abbreviated technical report is acceptable. As the reviewing agency, the WV SHPO concurred with the recommendation that no further archaeological investigations were warranted and no archaeological historic properties are present in the study area. More information is available in the EA appendices. The EA and appendices are available on the WVDOH website: https://transportation.wv.gov/highways/engineering/comment/closed/greenbagroadimprovementproject/Pages/default.aspx.
343	The turn lane options that were examined do not improve the level of service as much as the roundabout and the turn lanes at Dorsey Avenue/Kingwood Pike involve complete takes of 2 residences and 1 business. These takes are different from what was reported in the EA. This change will be noted in the FONSI. Adding only left turn lanes on Greenbag Road at the Dorsey/Kingwood Pike intersection was evaluated

	during an initial round of traffic analysis because this option had been suggested by the MPO. The option included upgrading the signal lights to have a protected/permissive left turn phase. The analysis showed that this option would result in some intersection improvements but could not achieve LOS C or better for the overall intersection operation. The overall intersection would operate at an unacceptable LOS (LOS E or F). The eastbound Greenbag Road traffic queue would extend past the Bluegrass Village Driveway. Based on these findings this option was replaced with Options D and E for the EA analysis. Sidewalks are included in both of the build alternatives considered. One of the major differences between Greenbag Road and the Mileground, is the volume of traffic. Greenbag Road has less than half the traffic volume that Mileground has. A second major difference is the general configuration of the roundabouts. The proposed roundabouts on Greenbag are more straightforward and more traditional roundabout designs, without all of the confusing lanes that are present at Mileground. The roundabouts on Greenbag Road will be more intuitive for drivers. The WVDOH has an educational video on how to use a roundabout available for viewing at https://www.youtube.com/watch?v=7njH4MKyo0w.
344	We appreciate your input regarding the project.
345	Roundabouts are designed to maintain a constant flow of traffic through the intersection which results in reduced congestion on roadways and a reduction in delays for drivers. Studies have shown that changing signalized intersections to roundabouts can have up to an 89% average reduction in vehicle delays. The improved traffic flow also results in reduced vehicle emissions including carbon monoxide, nitrous oxide, and carbon dioxide at the intersection. Additionally, roundabouts are designed to slow speeds in the approach and through the roundabout allowing drivers more response time and limiting the number of potential directions where traffic could approach.
346	The traffic control plan will continue to be revised during final design, and will not use Aaron's Creek Road as a signed detour. The revised plan intends to utilize the center of the Dorsey/Kingwood roundabout as a temporary intersection with temporary traffic signals. A short-term detour is proposed using Summers School Road while constructing the connection of the existing Kingwood Pike with the new portion. Any signed detours will be evaluated during final design as well as upgrades to these routes.
347	We appreciate your input regarding the project.
348	WVDOH's discussion of the response provided during the discussion: I explained the process that we have followed to date and referred her to the FHWA guidelines for NEPA. Redactions in the historical reports were in following the SHPO guidelines. I told her to send us any additional comments that she may have and to use a FOIA request if she wanted a specific document. The cultural resources surveys were conducted according to the guidelines published by the WV State Historic Preservation Office. The archaeological survey included the excavation of 213 shovel test pits, one test excavation unit, and visual inspection of the entire surface area within the defined area of potential effect. Based on the SHPO guidelines, when no cultural resources are identified during the Phase I survey, an abbreviated technical report is acceptable. As the reviewing agency, the WV SHPO concurred with the recommendation that no further archaeological investigations were warranted and no archaeological historic properties are present in the study area. The historic structures

	survey resulted in the identification of 25 structures 45+ years old within the defined area of potential effect. Two of the resources were recommended eligible for the National Register of Historic Places and the project was designed to avoid potential impacts to these properties. As the reviewing agency, the WV SHPO concurred with the recommendation that the project would not adversely affect any NRHP eligible resources and that no further historic structures investigations were needed. The cultural resources reports are available as an Appendix to the EA on the WVDOH website at https://transportation.wv.gov/highways/engineering/comment/closed/greenbagroadimprovementproject/Pages/default.aspx. The EA analysis included evaluation of potential impacts to numerous categories including natural resources, cultural resources, land use, indirect, and cumulative effects. More information is available as an Appendix to the EA on the WVDOH website at the link listed above. The West Virginia Division of Natural Resources and the US Fish and Wildlife Service both reviewed the project area. The WVDNR requested a mussel survey if in-stream work is anticipated in Cobun Creek and a spawning waiver if work will occur between April 1 and June 30. WVDOH environmental staff completed mussel and eagle nest surveys on July 22, 2019. No mussels or eagle nests were observed within the Project area. The USFWS reviewed the Project and determined "this project is not likely to adversely affect the Indiana bat." The USFWS also states that "the proposed project … will not affect any known Northern Long Eared Bat (NLEB) hibernacula … and no conservation measures are required."
349	The Greenbag Road Improvement Project is part of Governor Justice's Roads to Prosperity Program. The WV Division of Highways developed this project based on recommendations from the preliminary study that was completed by the Morgantown Monongalia Metropolitan Planning Organization (MMMPO) and documented in the Greenbag Road Corridor Study (March 2015). Due to the time constraints, general comments were not read aloud during the virtual public meeting held on September 29, 2020 from 5 to 8 pm. However, all comments and questions will be made part of the public record and become part of the final environmental clearance document. Questions posed by the public were read and answered during the virtual public meeting in order to provide information regarding the project to the community. The Environmental Assessment considered all necessary elements and impacts of the project and was approved by the Federal Highway Administration on August 28, 2020. Conscious Harvest Cooperative Community Garden, Joy and Hemp Universal LLC, and Mockingbird Hill Farms are located on private property and the property owner will be compensated for the sale of any land to the WVDOH during the right-of-way acquisition process. Impacts to this parcel have been minimized to the extent practicable. Approximately 1.56 acres (67,900 square feet) will be required from the parcel. Fair market value will be paid for all properties that require full or partial acquisition as a result of the project. When only part of the property is required, as is the case with this parcel, fair market value of the part taken will be paid, plus damages, if any, to the residue, less all benefits. West Virginia law defines "market value" as the price a willing buyer would pay a willing seller, neither acting under compulsion nor duress, both exercising prudence and intelligent judgment as to its value and familiar with the purpose for which the property is reasonably available. Fair market value will be determined by a competent, professional real estate appraiser after a thorough inspection of the property, a comparison with similar properties in the area that have been sold recently, a determination and consideration of its replacement cost and depreciation and consideration of the income-producing potential. All appraisal reports are office-reviewed, then rechecked in the field by experienced, qualified review appraisers for accuracy. Since the Division of Highways has adopted a firm price policy, the property owner will be offered the full

	amount of the approved appraisal. There will be no attempt to buy property at less than fair market value. This policy guarantees that all citizens of the state receive full value for the money expended for highway rights of way. Those who hold a valid property interest in the property that is acquired for the project will be compensated during the ROW acquisition phase.
350	The chat window was available on the project's public input website during the virtual public meeting on September 29, 2020 from 5 to 8 pm. During the September 29, 2020 virtual public meeting, the WVDOH personnel mentioned during each presentation that live phone calls would not be taken. However, there was a "leave a voicemail" option to leave a message which would be transcribed. Any questions would be read, and comments would become part of the project record. The public comment period was extended to 60 days to allow additional time for commenting.
351	The traffic control plan will continue to be revised during final design, and will not use Aaron's Creek Road as a signed detour. The revised plan intends to utilize the center of the Dorsey/Kingwood roundabout as a temporary intersection with temporary traffic signals. A short-term detour is proposed using Summers School Road while constructing the connection of the existing Kingwood Pike with the new portion. The MMMPO had completed several previous studies evaluating various transportation plans for the Greenbag Road corridor, with the ultimate vision of transforming Greenbag Road into a safe, efficient, and attractive multimodal transportation facility. The scenarios determined to be evaluated in the traffic study evolved from the outcome of the MMMPO's preliminary studies and findings. Existing two-way stop controlled operations with potential roadway improvements were evaluated as part of the traffic, as well as traffic signal and roundabout options. The evaluation and analysis of these intersection options indicate that the roundabout would provide the most improvement to traffic congestion, has the lowest estimated construction cost, and does not displace any residences. The turn lane options that were examined do not improve the level of service as much as the roundabout and the turn lanes at Dorsey Avenue/Kingwood Pike involve complete takes of 2 residences and 1 business. These takes are different from what was reported in the EA. This change will be noted in the FONSI. Adding only left turn lanes on Greenbag Road at the Dorsey/Kingwood Pike intersection was evaluated during an initial round of traffic analysis because this option had been suggested by the MPO. The option included upgrading the signal lights to have a protected/permissive left turn phase. The analysis showed that this option would result in some intersection improvements but could not achieve LOS C or better for the overall intersection operation. The overall intersection would operate at an unacceptable LOS (LOS E or F). The eastbound Greenbag Road traffic queue would extend past the Bluegrass Village Driveway. Based on these findings this option was replaced with Options D and E for the EA analysis. The need for a sidewalk was identified by the public in the comments for the MMMPO corridor study as one of the factors to improve safety in the Greenbag Road corridor. The public comment period extended from September 29 through November 30, 2020. Comments could be submitted via the online submittal system, emailed or mailed to the WVDOH. The diversion of traffic from downtown, including large trucks, is not within the scope of this project.

	The roundabouts were designed to accommodate AASHTO WB-62 truck configuration, which is an interstate semi-truck with a 62' wheel base between steer axle and last trailer axle, including a 48' trailer. Larger trucks can navigate the roundabout and use the internal truck apron. Roundabouts help reduce the likelihood and severity of collisions. Studies by the Federal Highway Administration (FHWA) have shown that roundabouts typically achieve reduction in overall collisions, injury collisions, fatality collisions, and pedestrian collisions. Reasons for these reductions due to the installation of a roundabout include: Low travel speeds – Drivers must slow down and yield to traffic before entering a roundabout. The reduction in speeds results in a decrease in crash severity and injury. No traffic light "to beat" – The design of a roundabout promotes a continuous circular flow of traffic. Because of this design, drivers will not have the incentive to speed up to "beat the light", like they may at a traditional intersection. One way travel – The design of a roundabout directs drivers through gently designed curves into a one-way counterclockwise circular path. This design eliminates the possibilities for T-bone and head-on collisions. In addition, a conventional 4-way intersection has 32 points of vehicle conflict due to the different maneuvers through the intersection. A roundabout has 8 points of conflict, which all occur in the same direction, reducing crash severity and likelihood of injury. The preferred alternative includes the construction of another retaining wall at the intersection of Kingwood Pike and Greenbag Road. At this time the proposed retaining wall on the south side of Greenbag Road east of the roundabout is anticipated to be approximately 350 feet in length and 8 to 18 feet tall. The final design will factor the geotechnical information needed to design the retaining wall and prevent further damage.
352	The cultural resources surveys were conducted according to the guidelines published by the WV State Historic Preservation Office. The archaeological survey included the excavation of 213 shovel test pits, one test excavation unit, and visual inspection of the entire surface area within the defined area of potential effect. Based on the SHPO guidelines, when no cultural resources are identified during the Phase I survey, an abbreviated technical report is acceptable. As the reviewing agency, the WV SHPO concurred with the recommendation that no further archaeological investigations were warranted and no archaeological historic properties are present in the study area. The historic structures survey resulted in the identification of 25 structures 45+ years old within the defined area of potential effect. Two of the resources were recommended eligible for the National Register of Historic Places and the project was designed to avoid potential impacts to these properties. As the reviewing agency, the WV SHPO concurred with the recommendation that the project would not adversely affect any NRHP eligible resources and that no further historic structures investigations were needed. The cultural resources reports are available as an Appendix to the EA on the WVDOH website at https://transportation.wv.gov/highways/engineering/comment/closed/greenbagroadimprovementproject/Pages/default.aspx.

	The EA reported impacts to Federal Farmland Protection Policy Act (FPPA) soils. The entire Greenbag Road environmental study area is encompassed by "land already in or committed to urban development" as defined by the FPPA (see 7 CFR § 658.2 - Definitions) and is therefore not subject to provisions of FPPA. Please refer to the Farmland Appendix attached to the FONSI for further detail. Conscious Harvest Cooperative Community Garden, Joy and Hemp Universal LLC, and Mockingbird Hill Farms are located on private property and the property owner will be compensated for the sale of any land to the WVDOH during the right-of-way acquisition process. Impacts to this parcel have been minimized to the extent practicable. Approximately 1.56 acres (67,900 square feet) will be required from the parcel. Fair market value will be paid for all properties that require full or partial acquisition as a result of the project. When only part of the property is required, as is the case with this parcel, fair market value of the part taken will be paid, plus damages, if any, to the residue, less all benefits. West Virginia law defines "market value" as the price a willing buyer would pay a willing seller, neither acting under compulsion nor duress, both exercising prudence and intelligent judgment as to its value and familiar with the purpose for which the property is reasonably available. Fair market value will be determined by a competent, professional real estate appraiser after a thorough inspection of the property, a comparison with similar properties in the area that have been sold recently, a determination and consideration of its replacement cost and depreciation and consideration of the income-producing potential. All appraisal reports are office-reviewed, then rechecked in the field by experienced, qualified review appraisers for accuracy. Since the Division of Highways has adopted a firm price policy, the property owner will be offered the full amount of the approved appraisal. There will be no attempt to buy property at less than fair market value. This policy guarantees that all citizens of the state receive full value for the money expended for highway rights of way. Those who hold a valid property interest in the property that is acquired for the project will be compensated during the ROW acquisition phase.
353	Changes to the interstate access in Morgantown are beyond the scope of the current project. The traffic control plan will continue to be revised during final design, and will not use Aaron's Creek Road as a signed detour. The revised plan intends to utilize the center of the Dorsey/Kingwood roundabout as a temporary intersection with temporary traffic signals. A short-term detour is proposed using Summers School Road while constructing the connection of the existing Kingwood Pike with the new portion.
354	The EA reported impacts to Federal Farmland Protection Policy Act (FPPA) soils. The entire Greenbag Road environmental study area is encompassed by "land already in or committed to urban development" as defined by the FPPA (see 7 CFR § 658.2 - Definitions) and is therefore not subject to provisions of FPPA. Please refer to the Farmland Appendix attached to the FONSI for further detail. Conscious Harvest Cooperative Community Garden, Joy and Hemp Universal LLC, and Mockingbird Hill Farms are located on private property and the property owner will be compensated for the sale of any land to the WVDOH during the right-of-way acquisition process. Impacts to this parcel have been minimized to the extent practicable. Approximately 1.56 acres (67,900 square feet) will be required from the parcel. Fair market value will be paid for all properties that require full or partial acquisition as a result of the project. When only part of the property is required, as is the case with this parcel, fair market value of the part taken will be paid, plus damages, if any, to the residue, less all benefits. West Virginia law defines "market value" as the price a willing buyer would pay a willing seller, neither acting under compulsion nor duress, both exercising prudence and intelligent judgment as to its value and familiar with the purpose for which the property is reasonably available. Fair

	market value will be determined by a competent, professional real estate appraiser after a thorough inspection of the property, a comparison with similar properties in the area that have been sold recently, a determination and consideration of its replacement cost and depreciation and consideration of the income-producing potential. All appraisal reports are office-reviewed, then rechecked in the field by experienced, qualified review appraisers for accuracy. Since the Division of Highways has adopted a firm price policy, the property owner will be offered the full amount of the approved appraisal. There will be no attempt to buy property at less than fair market value. This policy guarantees that all citizens of the state receive full value for the money expended for highway rights of way. Those who hold a valid property interest in the property that is acquired for the project will be compensated during the ROW acquisition phase.
355	The roundabouts were designed to accommodate AASHTO WB-62 truck configuration, which is an interstate semi-truck with a 62' wheel base between steer axle and last trailer axle, including a 48' trailer. Larger trucks can navigate the roundabout and use the internal truck apron. The turn lane options that were examined do not improve the level of service as much as the roundabout and the turn lanes at Dorsey Avenue/Kingwood Pike involve complete takes of 2 residences and 1 business. These takes are different from what was reported in the EA. This change will be noted in the FONSI. Adding only left turn lanes on Greenbag Road at the Dorsey/Kingwood Pike intersection was evaluated during an initial round of traffic analysis because this option had been suggested by the MPO. The option included upgrading the signal lights to have a protected/permissive left turn phase. The analysis showed that this option would result in some intersection improvements but could not achieve LOS C or better for the overall intersection operation. The overall intersection would operate at an unacceptable LOS (LOS E or F). The eastbound Greenbag Road traffic queue would extend past the Bluegrass Village Driveway. Based on these findings this option was replaced with Options D and E for the EA analysis. The intersection of Greenbag Road/Dorsey Avenue/Kingwood Pike is currently controlled by a traffic signal and not by a four-way (all-way) stop, which includes stop sign control on each approach. The intersection would operate at failure (overall intersection LOS F) if existing intersection conditions and operations (traffic signal control) were to remain the same 30-years in the future (design year) without any improvements. Therefore, traffic analysis was not completed for a four-way (all-way) stop controlled intersection operations. One of the major differences between Greenbag Road and the Mileground, is the volume of traffic. Greenbag Road has less than half the traffic volume that Mileground has. A second major difference is the general configuration of the roundabouts. The proposed roundabouts on Greenbag are more straightforward and more traditional roundabout designs, without all of the confusing lanes that are present at Mileground. The roundabouts on Greenbag Road will be more intuitive for drivers. The WVDOH has an educational video on how to use a roundabout available for viewing at https://www.youtube.com/watch?v=7njH4MKyo0w. Roundabouts are designed to maintain a constant flow of traffic through the intersection which results in reduced congestion on roadways and a reduction in delays for drivers. Studies have shown that changing signalized intersections to roundabouts can have up to an 89% average reduction in vehicle delays. The improved traffic flow also results in reduced vehicle emissions including carbon monoxide, nitrous oxide, and carbon dioxide at the intersection. Additionally, roundabouts are designed to slow speeds in the approach and through the roundabout allowing drivers more response time and limiting the number of potential directions where traffic could approach.

	Roundabouts help reduce the likelihood and severity of collisions. Studies by the Federal Highway Administration (FHWA) have shown that roundabouts typically achieve reduction in overall collisions, injury collisions, fatality collisions, and pedestrian collisions. Reasons for these reductions due to the installation of a roundabout include: Low travel speeds – Drivers must slow down and yield to traffic before entering a roundabout. The reduction in speeds results in a decrease in crash severity and injury. No traffic light "to beat" – The design of a roundabout promotes a continuous circular flow of traffic. Because of this design, drivers will not have the incentive to speed up to "beat the light", like they may at a traditional intersection. One way travel – The design of a roundabout directs drivers through gently designed curves into a one-way counterclockwise circular path. This design eliminates the possibilities for T-bone and head-on collisions. In addition, a conventional 4-way intersection has 32 points of vehicle conflict due to the different maneuvers through the intersection. A roundabout has 8 points of conflict, which all occur in the same direction, reducing crash severity and likelihood of injury.
356	Roundabouts are designed to maintain a constant flow of traffic through the intersection which results in reduced congestion on roadways and a reduction in delays for drivers. Studies have shown that changing signalized intersections to roundabouts can have up to an 89% average reduction in vehicle delays. The improved traffic flow also results in reduced vehicle emissions including carbon monoxide, nitrous oxide, and carbon dioxide at the intersection. A roundabout has 8 points of conflict, which all occur in the same direction, reducing crash severity and likelihood of injury. The WVDOH has an educational video on how to use a roundabout available for viewing at https://www.youtube.com/watch?v=7njH4MKyo0w.
359	As identified in this comment, speeding is a public concern on Luckey Lane. Luckey Lane is a narrow roadway, currently providing a variable width cartway between 17 to 19 feet for two-way traffic. Stop signs are present at the school exit only driveway and at Dorsey Avenue. As part of the preliminary design, Luckey Lane will accommodate two (2) 9-foot travel lanes, providing a total roadway width of 18-feet for two-way traffic, with curb and a 5-foot sidewalk along the northern side. Traffic calming measures to reduce speeding were not incorporated in the preliminary design. Traffic calming utilizes physical measures to reduce the negative impacts of motor vehicles/driver behavior. Potential measures to reduce speeds along roadways could include increased enforcement, signage, pavement markings, including installation of stop

	bars at stop sign locations, and speed humps/bumps. Thank you for enumerating these safety concerns. The WVDOH will examine these safety concerns as part of the final design.
360	1) Maintaining the existing alignment is not feasible given the topography and does not meet the project purpose and need. The re-alignment is to allow for the approach and exit slopes of Dorsey and Kingwood to be decreased (currently Kingwood Pike enters the intersection at -6.5%, the roundabout would flatten that to less than 2%) and to improve the approach angles. In the existing condition, the angle between Greenbag Road and Dorsey Avenue is 60° and in the proposed condition it is 74°, with close to 90° being ideal. 2) At this time there is a proposed retaining wall on the south side of Greenbag Road east of the roundabout (across from the former Atomic Grill). It is anticipated to be approximately 350 feet in length and 8 to 18 feet tall. 3) Table E-3 reports estimated construction costs for each combination of intersection improvements at Mississippi Street (A, B, or C) and the Dorsey Avenue / Kingwood Pike intersection (D, E, or F) under Alternative 1. Table E-4 reports estimated construction costs for each combination of intersection improvements at Mississippi Street and the Dorsey Avenue / Kingwood Pike intersection under Alternative 2. Alternative 1 with Intersection Options AD = $12,689,979.44 Alternative 2 with Intersection Options AD = $11,238,151,91 Alternative 1 with Intersection Options BD = $13,125,555.10 Alternative 2 with Intersection Options BD= $11,642,971.91 Alternative 1 with Intersection Options CD = $13,074,839.27 Alternative 2 with Intersection Options CD= $11,825,328.90 Alternative 1 with Intersection Options AE = $13,249,895.68 Alternative 2 with Intersection Options AE= $11,792,156.83 Alternative 1 with Intersection Options BE = $13,685,471.34 Alternative 2 with Intersection Options BE= $12,196,975.83 Alternative 1 with Intersection Options CE = $13,364,755.51 Alternative 2 with Intersection Options CE= $12,379,332.83 Alternative 1 with Intersection Options AF = $10,755,399.35 Alternative 2 with Intersection Options AF= $9,842,019.50 Alternative 1 with Intersection Options BF = $11,190,975.01 Alternative 2 with Intersection Options BF= $10,246,838.49 Alternative 1 with Intersection Options CF = $11,140,259.18 Alternative 2 with Intersection Options CF= $10,429,195.49 Funding for the project will include both State and Federal highway funds. Detailed information, including acreage impacts to various land cover types, associated with each alternative and intersection option, are provided in Tables 5-7 of the EA. Parcel ownership is publicly available and can be viewed on the Monongalia County parcel viewer (https://ags.agdmaps.com/wv/mon/). 4) Fair market value will be paid for all properties that require full or partial acquisition as a result of the project. When only part of the property is required, as is the case with this parcel, fair market value of the part taken will be paid, plus damages, if any, to the residue, less all benefits. West Virginia law defines “market value” as the price a willing buyer would pay a willing seller, neither acting under compulsion nor duress, both

	exercising prudence and intelligent judgment as to its value and familiar with the purpose for which the property is reasonably available. Fair market value will be determined by a competent, professional real estate appraiser after a thorough inspection of the property, a comparison with similar properties in the area that have been sold recently, a determination and consideration of its replacement cost and depreciation and consideration of the income-producing potential. All appraisal reports are office-reviewed, then rechecked in the field by experienced, qualified review appraisers for accuracy. Since the Division of Highways has adopted a firm price policy, the property owner will be offered the full amount of the approved appraisal. There will be no attempt to buy property at less than fair market value. This policy guarantees that all citizens of the state receive full value for the money expended for highway rights of way. Conscious Harvest Cooperative Community Garden, Joy and Hemp Universal LLC, and Mockingbird Hill Farms are located on private property and the property owner will be compensated for the sale of any land to the WVDOH during the right-of-way acquisition process. Impacts to this parcel have been minimized to the extent practicable. Approximately 1.56 acres (67,900 square feet) will be required from the parcel. 5) The preliminary design files are not available for distribution at this time.
361	The EA reviewed multiple alternatives including turn lanes, traffic lights, and the roundabouts. Through the analysis in the EA, the only alternative that meets the purpose and need of the project is the roundabout. The turn lane options that were examined do not improve the level of service as much as the roundabout at the intersection of Dorsey Avenue/Kingwood Pike. In addition, the turn lane option involves complete takes of 2 residences and 1 business. These takes are different from what was reported in the EA. This change will be noted in the FONSI. Adding only left turn lanes on Greenbag Road at the Dorsey/Kingwood Pike intersection was evaluated during an initial round of traffic analysis because this option had been suggested by the MPO. The option included upgrading the signal lights to have a protected/permissive left turn phase. The analysis showed that this option would result in some intersection improvements but could not achieve LOS C or better for the overall intersection operation. It should be noted that LOS C is WVDOH's design year level of service criteria threshold for intersection improvements. The overall intersection would operate at an unacceptable level of service (LOS E). In addition, the left turn lane option would result in the eastbound Greenbag Road traffic queue to extend past the Bluegrass Village Driveway. In regards to safety, a conventional 4-way intersection has 32 points of vehicle conflict due to vehicular maneuvers through the intersection. A roundabout has 8 points of vehicle conflict, which all occur in the same direction, reducing crash severity and likelihood of injury. Studies by the Federal Highway Administration (FHWA) have shown that roundabouts typically achieve reduction in overall collisions, injury collisions, fatality collisions, and pedestrian collisions. Reasons for these reductions due to the installation of a roundabout include: - Low travel speeds – Drivers must slow down and yield to traffic before entering a roundabout. The reduction in speeds results in a decrease in crash severity and injury. - No traffic light "to beat" – The design of a roundabout promotes a continuous circular flow of traffic. Because of this design, drivers will not have the incentive to speed up to "beat the light", like they may at a traditional intersection.

	- One way travel – The design of a roundabout directs drivers through gently designed curves into a one-way counterclockwise circular path. This design eliminates the possibilities for T-bone and head-on collisions. The EA reported impacts to Federal Farmland Protection Policy Act (FPPA) soils. The entire Greenbag Road environmental study area is encompassed by "land already in or committed to urban development" as defined by the FPPA (see 7 CFR § 658.2 - Definitions) and is therefore not subject to provisions of FPPA. Please refer to the Farmland Appendix attached to the FONSI for further detail. Conscious Harvest Cooperative Community Garden, Joy and Hemp Universal LLC, and Mockingbird Hill Farms are located on private property and the property owner will be compensated for the sale of any land to the WVDOH during the right-of-way acquisition process. Impacts to this parcel have been minimized to the extent practicable. Approximately 1.56 acres (67,900 square feet) will be required from the parcel. Fair market value will be paid for all properties that require full or partial acquisition as a result of the project. When only part of the property is required, as is the case with this parcel, fair market value of the part taken will be paid, plus damages, if any, to the residue, less all benefits. West Virginia law defines "market value" as the price a willing buyer would pay a willing seller, neither acting under compulsion nor duress, both exercising prudence and intelligent judgment as to its value and familiar with the purpose for which the property is reasonably available. Fair market value will be determined by a competent, professional real estate appraiser after a thorough inspection of the property, a comparison with similar properties in the area that have been sold recently, a determination and consideration of its replacement cost and depreciation and consideration of the income-producing potential. All appraisal reports are office-reviewed, then rechecked in the field by experienced, qualified review appraisers for accuracy. Since the Division of Highways has adopted a firm price policy, the property owner will be offered the full amount of the approved appraisal. There will be no attempt to buy property at less than fair market value. This policy guarantees that all citizens of the state receive full value for the money expended for highway rights of way. Those who hold a valid property interest in the property that is acquired for the project will be compensated during the ROW acquisition phase.
362	The option to add left turn lanes only on Greenbag Rd at the Dorsey/Kingwood Pike was one of the options suggested by the MMMPO study and was included on the first round of traffic analysis submitted to the WVDOH in February of 2019. This scenario also included upgrading the existing 2-phase traffic signal to 3-phases to incorporate a protected/permissive left turn phase. Installation of the turn lanes and modifying the signal phasing resulted in various approach and overall intersection LOS improvements; however, LOS C or better for the overall intersection operation could not be achieved. It was projected that some movements and the overall intersection would operate at an unacceptable level of service (LOS E or F). During the PM peak hour, the overall intersection is projected to operate at an overall intersection LOS E, and the eastbound through movement is forecasted to operate at a LOS F. This option would result in the Greenbag Road and Dorsey Avenue approaches queue lengths increasing. The eastbound Greenbag Road through movement queue will continue to extend past the Bluegrass Village driveway. Based on these findings and at the direction of the WVDOH, the traffic analysis was revised using additional options, which developed into Options D and E examined for the EA. The left turn lane only on Greenbag Road was not developed further and no impacts were assessed for the EA. The turn lane options that were examined in the EA do not improve the level of service as much as the roundabout and the turn lanes at Dorsey Avenue/Kingwood Pike involve complete takes of 2 residences and 1 business. These takes are different from what was reported in the EA. This change will be noted in the FONSI.

	Roundabouts are designed to maintain a constant flow of traffic through the intersection which results in reduced congestion on roadways and a reduction in delays for drivers. Studies have shown that changing signalized intersections to roundabouts can have up to an 89% average reduction in vehicle delays. The improved traffic flow also results in reduced vehicle emissions including carbon monoxide, nitrous oxide, and carbon dioxide at the intersection. Additionally, roundabouts are designed to slow speeds in the approach and through the roundabout allowing drivers more response time and limiting the number of potential directions where traffic could approach.
363	The EA analysis included evaluation of potential impacts to numerous categories including natural resources, cultural resources, land use, indirect, and cumulative effects. More information is available as an Appendix to the EA on the WVDOH website at https://transportation.wv.gov/highways/engineering/comment/closed/greenbagroadimprovementproject/Pages/default.aspx. Conscious Harvest Cooperative Community Garden, Joy and Hemp Universal LLC, and Mockingbird Hill Farms are located on private property and the property owner will be compensated for the sale of any land to the WVDOH during the right-of-way acquisition process. Impacts to this parcel have been minimized to the extent practicable. Approximately 1.56 acres (67,900 square feet) will be required from the parcel. Fair market value will be paid for all properties that require full or partial acquisition as a result of the project. When only part of the property is required, as is the case with this parcel, fair market value of the part taken will be paid, plus damages, if any, to the residue, less all benefits. West Virginia law defines “market value” as the price a willing buyer would pay a willing seller, neither acting under compulsion nor duress, both exercising prudence and intelligent judgment as to its value and familiar with the purpose for which the property is reasonably available. Fair market value will be determined by a competent, professional real estate appraiser after a thorough inspection of the property, a comparison with similar properties in the area that have been sold recently, a determination and consideration of its replacement cost and depreciation and consideration of the income-producing potential. All appraisal reports are office-reviewed, then rechecked in the field by experienced, qualified review appraisers for accuracy. There will be no attempt to buy property at less than fair market value. This policy guarantees that all citizens of the state receive full value for the money expended for highway rights of way. Those who hold a valid property interest in the property that is acquired for the project will be compensated during the ROW acquisition phase.
364	Roundabouts are designed to maintain a constant flow of traffic through the intersection which results in reduced congestion on roadways and a reduction in delays for drivers. Studies have shown that changing signalized intersections to roundabouts can have up to an 89% average reduction in vehicle delays. The improved traffic flow also results in reduced vehicle emissions including carbon monoxide, nitrous oxide, and carbon dioxide at the intersection. Additionally, roundabouts are designed to slow speeds in the approach and through the roundabout allowing drivers more response time and limiting the number of potential directions where traffic could approach. The option to add left turn lanes only on Greenbag Rd at the Dorsey/Kingwood Pike was one of the options suggested by the MMMPO study and was included on the first round of traffic analysis submitted to the WVDOH in February of 2019. This scenario also included upgrading the existing 2-phase traffic signal to 3-phases to incorporate a protected/permissive left turn phase. Installation of the turn lanes and modifying the signal phasing resulted in various approach and overall intersection LOS improvements; however, LOS C or better for the overall intersection operation could not be achieved. It was projected that some movements and the overall intersection would operate at an unacceptable level of

	service (LOS E or F). During the PM peak hour, the overall intersection is projected to operate at an overall intersection LOS E, and the eastbound through movement is forecasted to operate at a LOS F. This option would result in the Greenbag Road and Dorsey Avenue approaches queue lengths increasing. The eastbound Greenbag Road through movement queue will continue to extend past the Bluegrass Village driveway. Based on these findings and at the direction of the WVDOH, the traffic analysis was revised using additional options, which developed into Options D and E examined for the EA. The left turn lane only on Greenbag Road was not developed further and no impacts were assessed for the EA. The turn lane options that were examined in the EA do not improve the level of service as much as the roundabout and the turn lanes at Dorsey Avenue/Kingwood Pike involve complete takes of 2 residences and 1 business. These takes are different from what was reported in the EA. This change will be noted in the FONSI.
365	Both the MMMPO corridor study and the 2018 traffic study determined that traffic flow through the corridor is controlled by the congestion at the major intersections in the corridor. The projected growth in the Morgantown area will continue to increase traffic and congestion at the intersections if improvements do not occur. The option to add left turn lanes only on Greenbag Rd at the Dorsey/Kingwood Pike was one of the options suggested by the MMMPO study and was included on the first round of traffic analysis submitted to the WVDOH in February of 2019. This scenario also included upgrading the existing 2-phase traffic signal to 3-phases to incorporate a protected/permissive left turn phase. Installation of the turn lanes and modifying the signal phasing resulted in various approach and overall intersection LOS improvements; however, LOS C or better for the overall intersection operation could not be achieved. It was projected that some movements and the overall intersection would operate at an unacceptable level of service (LOS E or F). The turn lane options that were examined in the EA do not improve the level of service as much as the roundabout and the turn lanes at Dorsey Avenue/Kingwood Pike involve complete takes of 2 residences and 1 business. These takes are different from what was reported in the EA. This change will be noted in the FONSI. The diversion of traffic from downtown, including large trucks, is not within the scope of this project. Roundabouts are designed to maintain a constant flow of traffic through the intersection which results in reduced congestion on roadways and a reduction in delays for drivers. Studies have shown that changing signalized intersections to roundabouts can have up to an 89% average reduction in vehicle delays. The improved traffic flow also results in reduced vehicle emissions including carbon monoxide, nitrous oxide, and carbon dioxide at the intersection. Additionally, roundabouts are designed to slow speeds in the approach and through the roundabout allowing drivers more response time and limiting the number of potential directions where traffic could approach.
366	Roundabouts are designed to maintain a constant flow of traffic through the intersection which results in reduced congestion on roadways and a reduction in delays for drivers. Studies have shown that changing signalized intersections to roundabouts can have up to an 89% average

	reduction in vehicle delays. The improved traffic flow also results in reduced vehicle emissions including carbon monoxide, nitrous oxide, and carbon dioxide at the intersection. Additionally, roundabouts are designed to slow speeds in the approach and through the roundabout allowing drivers more response time and limiting the number of potential directions where traffic could approach.
367	Roundabouts are designed to maintain a constant flow of traffic through the intersection which results in reduced congestion on roadways and a reduction in delays for drivers. Studies have shown that changing signalized intersections to roundabouts can have up to an 89% average reduction in vehicle delays. The improved traffic flow also results in reduced vehicle emissions including carbon monoxide, nitrous oxide, and carbon dioxide at the intersection. Additionally, roundabouts are designed to slow speeds in the approach and through the roundabout allowing drivers more response time and limiting the number of potential directions where traffic could approach. The traffic control plan will continue to be revised during final design, and will not use Aaron's Creek Road as a signed detour. The revised plan intends to utilize the center of the Dorsey/Kingwood roundabout as a temporary intersection with temporary traffic signals. A short-term detour is proposed using Summers School Road while constructing the connection of the existing Kingwood Pike with the new portion.
368	The option to add left turn lanes only on Greenbag Rd at the Dorsey/Kingwood Pike was one of the options suggested by the MMMPO study and was included on the first round of traffic analysis submitted to the WVDOH in February of 2019. This scenario also included upgrading the existing 2-phase traffic signal to 3-phases to incorporate a protected/permissive left turn phase. Installation of the turn lanes and modifying the signal phasing resulted in various approach and overall intersection LOS improvements; however, LOS C or better for the overall intersection operation could not be achieved. It was projected that some movements and the overall intersection would operate at an unacceptable level of service (LOS E or F). The left turn lane only on Greenbag Road was not developed further and no impacts were assessed for the EA. The turn lane options that were examined in the EA do not improve the level of service as much as the roundabout and the turn lanes at Dorsey Avenue/Kingwood Pike involve complete takes of 2 residences and 1 business. These takes are different from what was reported in the EA. This change will be noted in the FONSI.
369	Roundabouts are designed to maintain a constant flow of traffic through the intersection which results in reduced congestion on roadways and a reduction in delays for drivers. Studies have shown that changing signalized intersections to roundabouts can have up to an 89% average reduction in vehicle delays. The improved traffic flow also results in reduced vehicle emissions including carbon monoxide, nitrous oxide, and carbon dioxide at the intersection. Additionally, roundabouts are designed to slow speeds in the approach and through the roundabout allowing drivers more response time and limiting the number of potential directions where traffic could approach.
370	The EA reviewed multiple alternatives including turn lanes, traffic lights, and the roundabouts. Through the analysis in the EA, the only alternative that meets the purpose and need of the project is the roundabout.

	The roundabouts were designed to accommodate AASHTO WB-62 truck configuration, which is an interstate semi-truck with a 62' wheel base between steer axle and last trailer axle, including a 48' trailer. Larger trucks can navigate the roundabout and use the internal truck apron. The option to add left turn lanes only on Greenbag Rd at the Dorsey/Kingwood Pike was one of the options suggested by the MMMPO study and was included on the first round of traffic analysis submitted to the WVDOH in February of 2019. This scenario also included upgrading the existing 2-phase traffic signal to 3-phases to incorporate a protected/permissive left turn phase. Installation of the turn lanes and modifying the signal phasing resulted in various approach and overall intersection LOS improvements; however, LOS C or better for the overall intersection operation could not be achieved. It was projected that some movements and the overall intersection would operate at an unacceptable level of service (LOS E or F). During the PM peak hour, the overall intersection is projected to operate at an overall intersection LOS E, and the eastbound through movement is forecasted to operate at a LOS F. This option would result in the Greenbag Road and Dorsey Avenue approaches queue lengths increasing. The eastbound Greenbag Road through movement queue will continue to extend past the Bluegrass Village driveway. Based on these findings and at the direction of the WVDOH, the traffic analysis was revised using additional options, which developed into Options D and E examined for the EA. The left turn lane only on Greenbag Road was not developed further and no impacts were assessed for the EA. The turn lane options that were examined in the EA do not improve the level of service as much as the roundabout and the turn lanes at Dorsey Avenue/Kingwood Pike involve complete takes of 2 residences and 1 business. These takes are different from what was reported in the EA. This change will be noted in the FONSI. The traffic control plan will continue to be revised during final design, and will not use Aaron's Creek Road as a signed detour. The revised plan intends to utilize the center of the Dorsey/Kingwood roundabout as a temporary intersection with temporary traffic signals. A short-term detour is proposed using Summers School Road while constructing the connection of the existing Kingwood Pike with the new portion. The existing grade on Kingwood Pike requires stopping on a -6.5% grade at the traffic signal. The grade approaching the roundabout includes a flat grade of less than 2% at the roundabout. This will result in an improvement in intersection operations during inclement weather. Roundabouts help reduce the likelihood and severity of collisions. Studies by the Federal Highway Administration (FHWA) have shown that roundabouts typically achieve reduction in overall collisions, injury collisions, fatality collisions, and pedestrian collisions. Reasons for these reductions due to the installation of a roundabout include: Low travel speeds – Drivers must slow down and yield to traffic before entering a roundabout. The reduction in speeds results in a decrease in crash severity and injury. No traffic light "to beat" – The design of a roundabout promotes a continuous circular flow of traffic. Because of this design, drivers will not have the incentive to speed up to "beat the light", like they may at a traditional intersection. One way travel – The design of a roundabout directs drivers through gently designed curves into a one-way counterclockwise circular path. This design eliminates the possibilities for T-bone and head-on collisions.

	In addition, a conventional 4-way intersection has 32 points of vehicle conflict due to the different maneuvers through the intersection. A roundabout has 8 points of conflict, which all occur in the same direction, reducing crash severity and likelihood of injury.
371	Roundabouts are designed to maintain a constant flow of traffic through the intersection which results in reduced congestion on roadways and a reduction in delays for drivers. Studies have shown that changing signalized intersections to roundabouts can have up to an 89% average reduction in vehicle delays. The improved traffic flow also results in reduced vehicle emissions including carbon monoxide, nitrous oxide, and carbon dioxide at the intersection. Additionally, roundabouts are designed to slow speeds in the approach and through the roundabout allowing drivers more response time and limiting the number of potential directions where traffic could approach.
372	Roundabouts are designed to maintain a constant flow of traffic through the intersection which results in reduced congestion on roadways and a reduction in delays for drivers. Studies have shown that changing signalized intersections to roundabouts can have up to an 89% average reduction in vehicle delays. The improved traffic flow also results in reduced vehicle emissions including carbon monoxide, nitrous oxide, and carbon dioxide at the intersection. Additionally, roundabouts are designed to slow speeds in the approach and through the roundabout allowing drivers more response time and limiting the number of potential directions where traffic could approach. Road repair beyond the scope of this project is being addressed through the Governor's Roads to Prosperity program and progress can be tracked via the WVDOH website. Drainage issues will be addressed within the project area.
373	Adding only left turn lanes on Greenbag Road at the Dorsey/Kingwood Pike intersection was evaluated during an initial round of traffic analysis because this option had been suggested by the MPO. The option included upgrading the signal lights to have a protected/permissive left turn phase. The analysis showed that this option would result in some intersection improvements but could not achieve LOS C or better for the overall intersection operation. The overall intersection would operate at an unacceptable LOS (LOS E or F). The eastbound Greenbag Road traffic queue would extend past the Bluegrass Village Driveway. Based on these findings this option was replaced with Options D and E for the EA analysis. Road repair beyond the scope of this project is being addressed through the Governor's Roads to Prosperity program and progress can be tracked via the WVDOH website.
374	Roundabouts are designed to maintain a constant flow of traffic through the intersection which results in reduced congestion on roadways and a reduction in delays for drivers. Studies have shown that changing signalized intersections to roundabouts can have up to an 89% average reduction in vehicle delays. The improved traffic flow also results in reduced vehicle emissions including carbon monoxide, nitrous oxide, and carbon dioxide at the intersection. Additionally, roundabouts are designed to slow speeds in the approach and through the roundabout allowing drivers more response time and limiting the number of potential directions where traffic could approach.
375	Roundabouts are designed to maintain a constant flow of traffic through the intersection which results in reduced congestion on roadways and a reduction in delays for drivers. Studies have shown that changing signalized intersections to roundabouts can have up to an 89% average reduction in vehicle delays. The improved traffic flow also results in reduced vehicle emissions including carbon monoxide, nitrous oxide, and

	carbon dioxide at the intersection. Additionally, roundabouts are designed to slow speeds in the approach and through the roundabout allowing drivers more response time and limiting the number of potential directions where traffic could approach.
376	We appreciate your input regarding the project.
377	Roundabouts are designed to maintain a constant flow of traffic through the intersection which results in reduced congestion on roadways and a reduction in delays for drivers. Studies have shown that changing signalized intersections to roundabouts can have up to an 89% average reduction in vehicle delays. 380	The EA reviewed multiple alternatives including turn lanes, traffic lights, and the roundabouts. Through the analysis in the EA, the only alternative that meets the purpose and need of the project is the roundabout. Both the MMMPO corridor study and the 2018 traffic study determined that traffic flow through the corridor is controlled by the congestion at the major intersections in the corridor. The projected growth in the Morgantown area will continue to increase traffic and congestion at the intersections if improvements do not occur.

	Roundabouts are designed to maintain a constant flow of traffic through the intersection which results in reduced congestion on roadways and a reduction in delays for drivers. Studies have shown that changing signalized intersections to roundabouts can have up to an 89% average reduction in vehicle delays. The improved traffic flow also results in reduced vehicle emissions including carbon monoxide, nitrous oxide, and carbon dioxide at the intersection. Additionally, roundabouts are designed to slow speeds in the approach and through the roundabout allowing drivers more response time and limiting the number of potential directions where traffic could approach. The option to add left turn lanes only on Greenbag Rd at the Dorsey/Kingwood Pike was one of the options suggested by the MMMPO study and was included on the first round of traffic analysis submitted to the WVDOH in February of 2019. This scenario also included upgrading the existing 2-phase traffic signal to 3-phases to incorporate a protected/permissive left turn phase. Installation of the turn lanes and modifying the signal phasing resulted in various approach and overall intersection LOS improvements; however, LOS C or better for the overall intersection operation could not be achieved. It was projected that some movements and the overall intersection would operate at an unacceptable level of service (LOS E or F). During the PM peak hour, the overall intersection is projected to operate at an overall intersection LOS E, and the eastbound through movement is forecasted to operate at a LOS F. This option would result in the Greenbag Road and Dorsey Avenue approaches queue lengths increasing. The eastbound Greenbag Road through movement queue will continue to extend past the Bluegrass Village driveway. Based on these findings and at the direction of the WVDOH, the traffic analysis was revised using additional options, which developed into Options D and E examined for the EA. The left turn lane only on Greenbag Road was not developed further and no impacts were assessed for the EA. The turn lane options that were examined in the EA do not improve the level of service as much as the roundabout and the turn lanes at Dorsey Avenue/Kingwood Pike involve complete takes of 2 residences and 1 business. These takes are different from what was reported in the EA. This change will be noted in the FONSI. Property owners will be compensated for the sale of any land to the WVDOH during the right-of-way acquisition process. Impacts have been minimized to the extent practicable.
381	The EA reviewed multiple alternatives including turn lanes, traffic lights, and the roundabouts. Through the analysis in the EA, the only alternative that meets the purpose and need of the project is the roundabout. Both the MMMPO corridor study and the 2018 traffic study determined that traffic flow through the corridor is controlled by the congestion at the major intersections in the corridor. The projected growth in the Morgantown area will continue to increase traffic and congestion at the intersections if improvements do not occur.
382	The EA reviewed multiple alternatives including turn lanes, traffic lights, and the roundabouts. Through the analysis in the EA, the only alternative that meets the purpose and need of the project is the roundabout. Both the MMMPO corridor study and the 2018 traffic study determined that traffic flow through the corridor is controlled by the congestion at the major intersections in the corridor. The projected growth in the Morgantown area will continue to increase traffic and congestion at the intersections if improvements do not occur. Roundabouts are designed to maintain a constant flow of traffic through the intersection which results in reduced congestion on roadways and a reduction in delays for drivers. Studies have shown that changing signalized intersections to roundabouts can have up to an 89% average reduction in vehicle delays. The improved traffic flow also results in reduced vehicle emissions including carbon monoxide, nitrous oxide, and

	carbon dioxide at the intersection. Additionally, roundabouts are designed to slow speeds in the approach and through the roundabout allowing drivers more response time and limiting the number of potential directions where traffic could approach.
383	The EA reviewed multiple alternatives including turn lanes, traffic lights, and the roundabouts. Through the analysis in the EA, the only alternative that meets the purpose and need of the project is the roundabout. Both the MMMPO corridor study and the 2018 traffic study determined that traffic flow through the corridor is controlled by the congestion at the major intersections in the corridor. The projected growth in the Morgantown area will continue to increase traffic and congestion at the intersections if improvements do not occur. Roundabouts are designed to maintain a constant flow of traffic through the intersection which results in reduced congestion on roadways and a reduction in delays for drivers. Studies have shown that changing signalized intersections to roundabouts can have up to an 89% average reduction in vehicle delays. The improved traffic flow also results in reduced vehicle emissions including carbon monoxide, nitrous oxide, and carbon dioxide at the intersection. Additionally, roundabouts are designed to slow speeds in the approach and through the roundabout allowing drivers more response time and limiting the number of potential directions where traffic could approach. Adding only left turn lanes on Greenbag Road at the Dorsey/Kingwood Pike intersection was evaluated during an initial round of traffic analysis because this option had been suggested by the MPO. The option included upgrading the signal lights to have a protected/permissive left turn phase. The analysis showed that this option would result in some intersection improvements but could not achieve LOS C or better for the overall intersection operation. The overall intersection would operate at an unacceptable LOS (LOS E or F). The eastbound Greenbag Road traffic queue would extend past the Bluegrass Village Driveway. Based on these findings this option was replaced with Options D and E for the EA analysis. Road repair beyond the scope of this project is being addressed through the Governor's Roads to Prosperity program and progress can be tracked via the WVDOH website. Conscious Harvest Cooperative Community Garden, Joy and Hemp Universal LLC, and Mockingbird Hill Farms are located on private property and the property owner will be compensated for the sale of any land to the WVDOH during the right-of-way acquisition process. Impacts to this parcel have been minimized to the extent practicable. Approximately 1.56 acres (67,900 square feet) will be required from the parcel. Fair market value will be paid for all properties that require full or partial acquisition as a result of the project. When only part of the property is required, as is the case with this parcel, fair market value of the part taken will be paid, plus damages, if any, to the residue, less all benefits. West Virginia law defines “market value” as the price a willing buyer would pay a willing seller, neither acting under compulsion nor duress, both exercising prudence and intelligent judgment as to its value and familiar with the purpose for which the property is reasonably available. Fair market value will be determined by a competent, professional real estate appraiser after a thorough inspection of the property, a comparison with similar properties in the area that have been sold recently, a determination and consideration of its replacement cost and depreciation and consideration of the income-producing potential. All appraisal reports are office-reviewed, then rechecked in the field by experienced, qualified review appraisers for accuracy. Since the Division of Highways has adopted a firm price policy, the property owner will be offered the full amount of the approved appraisal. There will be no attempt to buy property at less than fair market value. This policy guarantees that all citizens of the state receive full value for the money expended for highway rights of way.

	Those who hold a valid property interest in the property that is acquired for the project will be compensated during the ROW acquisition phase.
384	We appreciate your input regarding the project.
385	We appreciate your input regarding the project.
386	The EA reviewed multiple alternatives including turn lanes, traffic lights, and the roundabouts. Through the analysis in the EA, the only alternative that meets the purpose and need of the project is the roundabout. The turn lane options that were examined in the EA do not improve the level of service as much as the roundabout and the turn lanes at Dorsey Avenue/Kingwood Pike involve complete takes of 2 residences and 1 business. These takes are different from what was reported in the EA. This change will be noted in the FONS Roundabouts help reduce the likelihood and severity of collisions. Studies by the Federal Highway Administration (FHWA) have shown that roundabouts typically achieve reduction in overall collisions, injury collisions, fatality collisions, and pedestrian collisions. Reasons for these reductions due to the installation of a roundabout include: Low travel speeds – Drivers must slow down and yield to traffic before entering a roundabout. The reduction in speeds results in a decrease in crash severity and injury. No traffic light "to beat" – The design of a roundabout promotes a continuous circular flow of traffic. Because of this design, drivers will not have the incentive to speed up to "beat the light", like they may at a traditional intersection. One way travel – The design of a roundabout directs drivers through gently designed curves into a one-way counterclockwise circular path. This design eliminates the possibilities for T-bone and head-on collisions. In addition, a conventional 4-way intersection has 32 points of vehicle conflict due to the different maneuvers through the intersection. A roundabout has 8 points of conflict, which all occur in the same direction, reducing crash severity and likelihood of injury. Road repair beyond the scope of this project is being addressed through the Governor's Roads to Prosperity program and progress can be tracked via the WVDOH website.

389	We appreciate your input regarding the project.
390	The EA reviewed multiple alternatives including turn lanes, traffic lights, and the roundabouts. Through the analysis in the EA, the only alternative that meets the purpose and need of the project is the roundabout. The traffic control plan will continue to be revised during final design, and will not use Aaron's Creek Road as a signed detour. The revised plan intends to utilize the center of the Dorsey/Kingwood roundabout as a temporary intersection with temporary traffic signals. A short-term detour is proposed using Summers School Road while constructing the connection of the existing Kingwood Pike with the new portion. Road repair beyond the scope of this project is being addressed through the Governor's Roads to Prosperity program and progress can be tracked via the WVDOH website.

	The referenced property owner will be compensated for the sale of any land to the WVDOH during the right-of-way acquisition process. Impacts to this parcel have been minimized to the extent practicable. Approximately 1.56 acres (67,900 square feet) will be required from the parcel. Fair market value will be paid for all properties that require full or partial acquisition as a result of the project. When only part of the property is required, as is the case with this parcel, fair market value of the part taken will be paid, plus damages, if any, to the residue, less all benefits. West Virginia law defines "market value" as the price a willing buyer would pay a willing seller, neither acting under compulsion nor duress, both exercising prudence and intelligent judgment as to its value and familiar with the purpose for which the property is reasonably available. Fair market value will be determined by a competent, professional real estate appraiser after a thorough inspection of the property, a comparison with similar properties in the area that have been sold recently, a determination and consideration of its replacement cost and depreciation and consideration of the income-producing potential. All appraisal reports are office-reviewed, then rechecked in the field by experienced, qualified review appraisers for accuracy. Since the Division of Highways has adopted a firm price policy, the property owner will be offered the full amount of the approved appraisal. There will be no attempt to buy property at less than fair market value. This policy guarantees that all citizens of the state receive full value for the money expended for highway rights of way. Those who hold a valid property interest in the property that is acquired for the project will be compensated during the ROW acquisition phase. The MMMPO had completed several previous studies evaluating various transportation plans for the Greenbag Road corridor, with the ultimate vision of transforming Greenbag Road into a safe, efficient, and attractive multimodal transportation facility. The scenarios determined to be evaluated in the traffic study evolved from the outcome of the MMMPO's preliminary studies and findings. Existing two-way stop controlled operations with potential roadway improvements were evaluated as part of the traffic, as well as traffic signal and roundabout options. The intersection of Greenbag Road/Dorsey Avenue/Kingwood Pike is currently controlled by a traffic signal and not by a four-way (all-way) stop, which includes stop sign control on each approach. The intersection would operate at failure (overall intersection LOS F) if existing intersection conditions and operations (traffic signal control) were to remain the same 30-years in the future (design year) without any improvements. Therefore, traffic analysis was not completed for a four-way (all-way) stop controlled intersection operations.
391	The EA reviewed multiple alternatives including turn lanes, traffic lights, and the roundabouts. Through the analysis in the EA, the only alternative that meets the purpose and need of the project is the roundabout. Both the MMMPO corridor study and the 2018 traffic study determined that traffic flow through the corridor is controlled by the congestion at the major intersections in the corridor. The projected growth in the Morgantown area will continue to increase traffic and congestion at the intersections if improvements do not occur. One of the major differences between Greenbag Road and the Mileground, is the volume of traffic. Greenbag Road has less than half the traffic volume that Mileground has. A second major difference is the general configuration of the roundabouts. The proposed roundabouts on Greenbag are more straightforward and more traditional roundabout designs, without all of the confusing lanes that are present at Mileground. The roundabouts on Greenbag Road will be more intuitive for drivers. The WVDOH has an educational video on how to use a roundabout available for viewing at https://www.youtube.com/watch?v=7njH4MKyo0w.

392	Both the MMMPO corridor study and the 2018 traffic study determined that traffic flow through the corridor is controlled by the congestion at the major intersections in the corridor. The projected growth in the Morgantown area will continue to increase traffic and congestion at the intersections if improvements do not occur. The MMMPO had completed several previous studies evaluating various transportation plans for the Greenbag Road corridor, with the ultimate vision of transforming Greenbag Road into a safe, efficient, and attractive multimodal transportation facility. The scenarios determined to be evaluated in the traffic study evolved from the outcome of the MMMPO's preliminary studies and findings. Existing two-way stop controlled operations with potential roadway improvements were evaluated as part of the traffic, as well as traffic signal and roundabout options. The intersection of Greenbag Road/Dorsey Avenue/Kingwood Pike is currently controlled by a traffic signal and not by a four-way (all-way) stop, which includes stop sign control on each approach. The intersection would operate at failure (overall intersection LOS F) if existing intersection conditions and operations (traffic signal control) were to remain the same 30-years in the future (design year) without any improvements. Therefore, traffic analysis was not completed for a four-way (all-way) stop controlled intersection operations. The preferred alternative includes the construction of another retaining wall at the intersection of Kingwood Pike and Greenbag Road. At this time the proposed retaining wall on the south side of Greenbag Road east of the roundabout is anticipated to be approximately 350 feet in length and 8 to 18 feet tall. The final design will factor the geotechnical information needed to design the retaining wall and prevent further damage.
393	The EA reviewed multiple alternatives including turn lanes, traffic lights, and the roundabouts. Through the analysis in the EA, the only alternative that meets the purpose and need of the project is the roundabout. Both the MMMPO corridor study and the 2018 traffic study determined that traffic flow through the corridor is controlled by the congestion at the major intersections in the corridor. The projected growth in the Morgantown area will continue to increase traffic and congestion at the intersections if improvements do not occur.
394	Roundabouts are designed to maintain a constant flow of traffic through the intersection which results in reduced congestion on roadways and a reduction in delays for drivers. Studies have shown that changing signalized intersections to roundabouts can have up to an 89% average reduction in vehicle delays. The improved traffic flow also results in reduced vehicle emissions including carbon monoxide, nitrous oxide, and carbon dioxide at the intersection. Additionally, roundabouts are designed to slow speeds in the approach and through the roundabout allowing drivers more response time and limiting the number of potential directions where traffic could approach.
395	The EA reviewed multiple alternatives including turn lanes, traffic lights, and the roundabouts. Through the analysis in the EA, the only alternative that meets the purpose and need of the project is the roundabout. Both the MMMPO corridor study and the 2018 traffic study determined that traffic flow through the corridor is controlled by the congestion at the major intersections in the corridor. The projected growth in the Morgantown area will continue to increase traffic and congestion at the intersections if improvements do not occur. Any property needed for the project will be acquired under the Uniform Relocation Assistance and Real Property Acquisition Act (1970) through negotiations with the landowners. .

396	Roundabouts are designed to maintain a constant flow of traffic through the intersection which results in reduced congestion on roadways and a reduction in delays for drivers. Studies have shown that changing signalized intersections to roundabouts can have up to an 89% average reduction in vehicle delays. The improved traffic flow also results in reduced vehicle emissions including carbon monoxide, nitrous oxide, and carbon dioxide at the intersection. Additionally, roundabouts are designed to slow speeds in the approach and through the roundabout allowing drivers more response time and limiting the number of potential directions where traffic could approach.
397	Adding only left turn lanes on Greenbag Road at the Dorsey/Kingwood Pike intersection was evaluated during an initial round of traffic analysis because this option had been suggested by the MPO. The option included upgrading the signal lights to have a protected/permissive left turn phase. The analysis showed that this option would result in some intersection improvements but could not achieve LOS C or better for the overall intersection operation. The overall intersection would operate at an unacceptable LOS (LOS E or F). The eastbound Greenbag Road traffic queue would extend past the Bluegrass Village Driveway. Based on these findings this option was replaced with Options D and E for the EA analysis. Road repair beyond the scope of this project is being addressed through the Governor's Roads to Prosperity program and progress can be tracked via the WVDOH website. The preferred alternative includes the construction of another retaining wall at the intersection of Kingwood Pike and Greenbag Road. At this time the proposed retaining wall on the south side of Greenbag Road east of the roundabout is anticipated to be approximately 350 feet in length and 8 to 18 feet tall. The final design will factor the geotechnical information needed to design the retaining wall and prevent further damage.
398	Roundabouts are designed to maintain a constant flow of traffic through the intersection which results in reduced congestion on roadways and a reduction in delays for drivers. Studies have shown that changing signalized intersections to roundabouts can have up to an 89% average reduction in vehicle delays. The improved traffic flow also results in reduced vehicle emissions including carbon monoxide, nitrous oxide, and carbon dioxide at the intersection. Additionally, roundabouts are designed to slow speeds in the approach and through the roundabout allowing drivers more response time and limiting the number of potential directions where traffic could approach.
399	The EA reviewed multiple alternatives including turn lanes, traffic lights, and the roundabouts. Through the analysis in the EA, the only alternative that meets the purpose and need of the project is the roundabout. Roundabouts are designed to maintain a constant flow of traffic through the intersection which results in reduced congestion on roadways and a reduction in delays for drivers. Studies have shown that changing signalized intersections to roundabouts can have up to an 89% average reduction in vehicle delays. The improved traffic flow also results in reduced vehicle emissions including carbon monoxide, nitrous oxide, and carbon dioxide at the intersection. The option included upgrading the signal lights to have a protected/permissive left turn phase. The analysis showed that this option would result in some intersection improvements but could not achieve LOS C or better for the overall intersection operation. The overall intersection would operate at an unacceptable LOS (LOS E or F). The eastbound Greenbag Road

	traffic queue would extend past the Bluegrass Village Driveway. Based on these findings this option was replaced with Options D and E for the EA analysis. Road repair beyond the scope of this project is being addressed through the Governor's Roads to Prosperity program and progress can be tracked via the WVDOH website.
400	Roundabouts help reduce vehicular delay and promotes a continuous flow of traffic, which increases traffic capacity at an intersection. Traffic entering a roundabout on each approach does not need to have the same volume of traffic in order to function optimally. Each roundabout is designed and adapted to the context of its location. Roundabouts are designed to maintain a constant flow of traffic through the intersection which results in reduced congestion on roadways and a reduction in delays for drivers. Studies have shown that changing signalized intersections to roundabouts can have up to an 89% average reduction in vehicle delays. The improved traffic flow also results in reduced vehicle emissions including carbon monoxide, nitrous oxide, and carbon dioxide at the intersection. Additionally, roundabouts are designed to slow speeds in the approach and through the roundabout allowing drivers more response time and limiting the number of potential directions where traffic could approach.
401	Roundabouts are designed to maintain a constant flow of traffic through the intersection which results in reduced congestion on roadways and a reduction in delays for drivers. Studies have shown that changing signalized intersections to roundabouts can have up to an 89% average reduction in vehicle delays. The improved traffic flow also results in reduced vehicle emissions including carbon monoxide, nitrous oxide, and carbon dioxide at the intersection. Additionally, roundabouts are designed to slow speeds in the approach and through the roundabout allowing drivers more response time and limiting the number of potential directions where traffic could approach.
402	The traffic control plan, which will outline the intended traffic detour tour, will continue to be revised during final design. It should be noted that Aaron's Creek Road will not be utilized as a signed detour. The anticipated plan intends to utilize the center of the Dorsey Avenue /Kingwood Pike roundabout as a temporary intersection with temporary traffic signals during construction. A short-term detour is proposed using Summers School Road while constructing the connection of the existing Kingwood Pike with the new portion.
403	This comment is noted.
404	This comment is noted.
405	Road repair beyond the scope of this project is being addressed through the Governor's Roads to Prosperity program and progress can be tracked via the WVDOH website. Roundabouts are designed to maintain a constant flow of traffic through the intersection which results in reduced congestion on roadways and a reduction in delays for drivers. Studies have shown that changing signalized intersections to roundabouts can have up to an 89% average reduction in vehicle delays. The improved traffic flow also results in reduced vehicle emissions including carbon monoxide, nitrous oxide, and carbon dioxide at the intersection. Additionally, roundabouts are designed to slow speeds in the approach and through the roundabout allowing drivers more response time and limiting the number of potential directions where traffic could approach. Both of these factors improve safety for all drivers, including older drivers as well as pedestrians, and cyclists. Signage meeting WVDOH and the Federal Manual on Uniform Traffic Control Devices will be placed to assist drivers with navigating the roundabouts.

406	The turn lane options that were examined do not improve the level of service as much as the roundabout at the intersection of Dorsey Avenue/Kingwood Pike. In addition, the turn lane option involves complete takes of 2 residences and 1 business. This change will be noted in the FONSI. Adding only left turn lanes on Greenbag Road at the Dorsey/Kingwood Pike intersection was evaluated during an initial round of traffic analysis because this option had been suggested by the MPO. The option included upgrading the signal lights to have a protected/permissive left turn phase. The analysis showed that this option would result in some intersection improvements but could not achieve LOS C or better for the overall intersection operation. It should be noted that LOS C is WVDOH's design year level of service criteria threshold for intersection improvements. The overall intersection would operate at an unacceptable level of service (LOS E). In addition, the left turn lane option would result in the eastbound Greenbag Road traffic queue to extend past the Bluegrass Village Driveway. In regards to safety, a conventional 4-way intersection has 32 points of vehicle conflict due to vehicular maneuvers through the intersection. A roundabout has 8 points of vehicle conflict, which all occur in the same direction, reducing crash severity and likelihood of injury. Studies by the Federal Highway Administration (FHWA) have shown that roundabouts typically achieve reduction in overall collisions, injury collisions, fatality collisions, and pedestrian collisions. Reasons for these reductions due to the installation of a roundabout include: - Low travel speeds – Drivers must slow down and yield to traffic before entering a roundabout. The reduction in speeds results in a decrease in crash severity and injury. - No traffic light "to beat" – The design of a roundabout promotes a continuous circular flow of traffic. Because of this design, drivers will not have the incentive to speed up to "beat the light", like they may at a traditional intersection. One way travel – The design of a roundabout directs drivers through gently designed curves into a one-way counterclockwise circular path. This design eliminates the possibilities for T-bone and head-on collisions.
407	The traffic control plan, which will outline the intended traffic detour tour, will continue to be revised during final design. It should be noted that Aaron's Creek Road will not be utilized as a signed detour. The anticipated plan intends to utilize the center of the Dorsey Avenue /Kingwood Pike roundabout as a temporary intersection with temporary traffic signals during construction. A short-term detour is proposed using Summers School Road while constructing the connection of the existing Kingwood Pike with the new portion. Conscious Harvest Cooperative Community Garden, Joy and Hemp Universal LLC, and Mockingbird Hill Farms are located on private property and the property owner will be compensated for the sale of any land to the WVDOH during the right-of-way acquisition process. Impacts to this parcel have been minimized to the extent practicable. Approximately 1.56 acres (67,900 square feet) will be required from the parcel. Fair market value will be paid for all properties that require full or partial acquisition as a result of the project. When only part of the property is required, as is the case with this parcel, fair market value of the part taken will be paid, plus damages, if any, to the residue, less all benefits. 	Road repair beyond the scope of this project is being addressed through the Governor's Roads to Prosperity program and progress can be tracked via the WVDOH website.
409	The EA reviewed multiple alternatives including turn lanes, traffic lights, and the roundabouts. Through the analysis in the EA, the only alternative that meets the purpose and need of the project is the roundabout.
410	We appreciate your input regarding the project.
411	The roundabouts were designed to accommodate AASHTO WB-62 truck configuration, which is an interstate semi-truck with a 62' wheel base between steer axle and last trailer axle, including a 48' trailer. Larger trucks can navigate the roundabout and use the internal truck apron Roundabouts help reduce the likelihood and severity of collisions. Studies by the Federal Highway Administration (FHWA) have shown that roundabouts typically achieve reduction in overall collisions, injury collisions, fatality collisions, and pedestrian collisions. Reasons for these reductions due to the installation of a roundabout include: Low travel speeds – Drivers must slow down and yield to traffic before entering a roundabout. The reduction in speeds results in a decrease in crash severity and injury. No traffic light "to beat" – The design of a roundabout promotes a continuous circular flow of traffic. Because of this design, drivers will not have the incentive to speed up to "beat the light", like they may at a traditional intersection. One way travel – The design of a roundabout directs drivers through gently designed curves into a one-way counterclockwise circular path. This design eliminates the possibilities for T-bone and head-on collisions. In addition, a conventional 4-way intersection has 32 points of vehicle conflict due to the different maneuvers through the intersection. A roundabout has 8 points of conflict, which all occur in the same direction, reducing crash severity and likelihood of injury.
412	Road repair beyond the scope of this project is being addressed through the Governor's Roads to Prosperity program and progress can be tracked via the WVDOH website. The traffic control plan, which will outline the intended traffic detour tour, will continue to be revised during final design. It should be noted that Aaron's Creek Road will not be utilized as a signed detour. The anticipated plan intends to utilize the center of the Dorsey Avenue /Kingwood Pike roundabout as a temporary intersection with temporary traffic signals during construction. A short-term detour is proposed using Summers School Road while constructing the connection of the existing Kingwood Pike with the new portion. Conscious Harvest Cooperative Community Garden, Joy and Hemp Universal LLC, and Mockingbird Hill Farms are located on private property and the property owner will be compensated for the sale of any land to the WVDOH during the right-of-way acquisition process. Impacts to this parcel have been minimized to the extent practicable. Approximately 1.56 acres (67,900 square feet) will be required from the parcel.

	Fair market value will be paid for all properties that require full or partial acquisition as a result of the project. When only part of the property is required, as is the case with this parcel, fair market value of the part taken will be paid, plus damages, if any, to the residue, less all benefits. West Virginia law defines "market value" as the price a willing buyer would pay a willing seller, neither acting under compulsion nor duress, both exercising prudence and intelligent judgment as to its value and familiar with the purpose for which the property is reasonably available. Fair market value will be determined by a competent, professional real estate appraiser after a thorough inspection of the property, a comparison with similar properties in the area that have been sold recently, a determination and consideration of its replacement cost and depreciation and consideration of the income-producing potential. All appraisal reports are office-reviewed, then rechecked in the field by experienced, qualified review appraisers for accuracy. Since the Division of Highways has adopted a firm price policy, the property owner will be offered the full amount of the approved appraisal. There will be no attempt to buy property at less than fair market value. This policy guarantees that all citizens of the state receive full value for the money expended for highway rights of way. Those who hold a valid property interest in the property that is acquired for the project will be compensated during the ROW acquisition phase. The preliminary investigation and engineering traffic study was completed to evaluate the Greenbag Road corridor, evaluating the existing and potential future operation of the intersections selected for study by WVDOH. The evaluation of existing roadway conditions, including the existing roadway conditions of Kingwood Pike, was not part of the preliminary investigation and engineering traffic study. The Greenbag Road corridor has long been recognized as a challenging roadway to navigate due to geometric deficiencies, significant intersection delays during the peak hours, and increased volume of truck traffic and development within the corridor. Several studies have been previously completed through the MMMPO, evaluating various transportation plans for the Greenbag Road corridor, with the ultimate vision of transforming Greenbag Road into a safe, efficient, and attractive multimodal transportation facility. It should be noted that the traffic evaluation was completed prior to the COVID-19 pandemic and its effects to traffic currently occurring. The turn lane options that were examined do not improve the level of service as much as the roundabout at the intersection of Dorsey Avenue/Kingwood Pike. In addition, the turn lane option involves complete takes of 2 residences and 1 business. This change will be noted in the FONSI. Adding only left turn lanes on Greenbag Road at the Dorsey/Kingwood Pike intersection was evaluated during an initial round of traffic analysis because this option had been suggested by the MPO. The option included upgrading the signal lights to have a protected/permissive left turn phase. The analysis showed that this option would result in some intersection improvements but could not achieve LOS C or better for the overall intersection operation. It should be noted that LOS C is WVDOH's design year level of service criteria threshold for intersection improvements. The overall intersection would operate at an unacceptable level of service (LOS E). In addition, the left turn lane option would result in the eastbound Greenbag Road traffic queue to extend past the Bluegrass Village Driveway. In regards to safety, a conventional 4-way intersection has 32 points of vehicle conflict due to vehicular maneuvers through the intersection. A roundabout has 8 points of vehicle conflict, which all occur in the same direction, reducing crash severity and likelihood of injury. Studies by the Federal Highway Administration (FHWA) have shown that roundabouts typically achieve reduction in overall collisions, injury collisions, fatality collisions, and pedestrian collisions. Reasons for these reductions due to the installation of a roundabout include:

	- Low travel speeds – Drivers must slow down and yield to traffic before entering a roundabout. The reduction in speeds results in a decrease in crash severity and injury. - No traffic light "to beat" – The design of a roundabout promotes a continuous circular flow of traffic. Because of this design, drivers will not have the incentive to speed up to "beat the light", like they may at a traditional intersection. - One way travel – The design of a roundabout directs drivers through gently designed curves into a one-way counterclockwise circular path. This design eliminates the possibilities for T-bone and head-on collisions. The existing grade on Kingwood Pike requires stopping on a -6.5% grade at the traffic signal. The grade approaching the roundabout includes a flat grade of less than 2% at the roundabout. In most cases, the roundabout will not require approaching traffic to come to a full or immediate stop, and does not queue traffic on the steep grade as the existing traffic signal does.
413	The EA reviewed multiple alternatives including turn lanes, traffic lights, and the roundabouts. Through the analysis in the EA, the only alternative that meets the purpose and need of the project is the roundabout. Road repair beyond the scope of this project is being addressed through the Governor's Roads to Prosperity program and progress can be tracked via the WVDOH website.
414	The preliminary investigation and engineering traffic study was completed to evaluate the Greenbag Road corridor, evaluating the existing and potential future operation of the intersections selected for study by WVDOH. The evaluation of existing roadway conditions, including the existing roadway conditions of Kingwood Pike, was not part of the preliminary investigation and engineering traffic study. The Greenbag Road corridor has long been recognized as a challenging roadway to navigate due to geometric deficiencies, significant intersection delays during the peak hours, and increased volume of truck traffic and development within the corridor. Several studies have been previously completed through the MMMPO, evaluating various transportation plans for the Greenbag Road corridor, with the ultimate vision of transforming Greenbag Road into a safe, efficient, and attractive multimodal transportation facility. It should be noted that the traffic evaluation was completed prior to the COVID-19 pandemic and its effects to traffic currently occurring. Both the MMMPO corridor study and the 2018 traffic study determined that traffic flow through the corridor is controlled by the congestion at the major intersections in the corridor. The projected growth in the Morgantown area will continue to increase traffic and congestion at the intersections if improvements do not occur. Roundabouts are designed to maintain a constant flow of traffic through the intersection which results in reduced congestion on roadways and a reduction in delays for drivers. Studies have shown that changing signalized intersections to roundabouts can have up to an 89% average reduction in vehicle delays. The improved traffic flow also results in reduced vehicle emissions including carbon monoxide, nitrous oxide, and carbon dioxide at the intersection.
415	The EA reviewed multiple alternatives including turn lanes, traffic lights, and the roundabouts. Through the analysis in the EA, the only alternative that meets the purpose and need of the project is the roundabout.

	Conscious Harvest Cooperative Community Garden, Joy and Hemp Universal LLC, and Mockingbird Hill Farms are located on private property and the property owner will be compensated for the sale of any land to the WVDOH during the right-of-way acquisition process. Impacts to this parcel have been minimized to the extent practicable. Approximately 1.56 acres (67,900 square feet) will be required from the parcel. It should be noted that the traffic evaluation was completed prior to the COVID-19 pandemic and its effects to traffic currently occurring.
419	The EA reviewed multiple alternatives including turn lanes, traffic lights, and the roundabouts. Through the analysis in the EA, the only alternative that meets the purpose and need of the project is the roundabout. The Greenbag Road roundabouts have major differences to other existing roundabouts within Morgantown, including the Mileground. Greenbag Road has less than half the traffic volume of the Mileground. A second major difference is the general configuration of the roundabouts. The proposed roundabouts on Greenbag are more straightforward and more traditional roundabout designs, without all of the confusing lanes that are present at Mileground. The roundabouts on Greenbag Road will be more intuitive for drivers. Every roundabout is designed and adapted to the context of its location. The roundabouts were designed to accommodate AASHTO WB-62 truck configuration, which is an interstate semi-truck with a 62’ wheel base between steer axle and last trailer axle, including a 48’ trailer. Larger trucks can navigate the roundabout and use the internal truck apron. The turn lane options that were examined do not improve the level of service as much as the roundabout at the intersection of Dorsey Avenue/Kingwood Pike. In addition, the turn lane option involves complete takes of 2 residences and 1 business. This change will be noted in the FONSI. Adding only left turn lanes on Greenbag Road at the Dorsey/Kingwood Pike intersection was evaluated during an initial round of traffic analysis because this option had been suggested by the MPO. The option included upgrading the signal lights to have a protected/permissive left turn phase. The analysis showed that this option would result in some intersection improvements but could not achieve LOS C or better for the overall intersection operation. It should be noted that LOS C is WVDOH’s design year level of service criteria

	threshold for intersection improvements. The overall intersection would operate at an unacceptable level of service (LOS E). In addition, the left turn lane option would result in the eastbound Greenbag Road traffic queue to extend past the Bluegrass Village Driveway. In regards to safety, a conventional 4-way intersection has 32 points of vehicle conflict due to vehicular maneuvers through the intersection. A roundabout has 8 points of vehicle conflict, which all occur in the same direction, reducing crash severity and likelihood of injury. Studies by the Federal Highway Administration (FHWA) have shown that roundabouts typically achieve reduction in overall collisions, injury collisions, fatality collisions, and pedestrian collisions. Reasons for these reductions due to the installation of a roundabout include: - Low travel speeds – Drivers must slow down and yield to traffic before entering a roundabout. The reduction in speeds results in a decrease in crash severity and injury. - No traffic light "to beat" – The design of a roundabout promotes a continuous circular flow of traffic. Because of this design, drivers will not have the incentive to speed up to "beat the light", like they may at a traditional intersection. One way travel – The design of a roundabout directs drivers through gently designed curves into a one-way counterclockwise circular path. This design eliminates the possibilities for T-bone and head-on collisions.
420	The turn lane options that were examined do not improve the level of service as much as the roundabout at the intersection of Dorsey Avenue/Kingwood Pike. In addition, the turn lane option involves complete takes of 2 residences and 1 business. This change will be noted in the FONSI. Adding only left turn lanes on Greenbag Road at the Dorsey/Kingwood Pike intersection was evaluated during an initial round of traffic analysis because this option had been suggested by the MPO. This design eliminates the possibilities for T-bone and head-on collisions. Any property needed for the project will be acquired under the Uniform Relocation Assistance and Real Property Acquisition Act (1970) through negotiations with the landowners.
424	We appreciate your input regarding the project.
425	We appreciate your input regarding the project.
426	The EA reviewed multiple alternatives including turn lanes, traffic lights, and the roundabouts. Through the analysis in the EA, the only alternative that meets the purpose and need of the project is the roundabout.
427	Road repair beyond the scope of this project is being addressed through the Governor's Roads to Prosperity program and progress can be tracked via the WVDOH website. Both the MMMPO corridor study and the 2018 traffic study determined that traffic flow through the corridor is

	controlled by the congestion at the major intersections in the corridor. The projected growth in the Morgantown area will continue to increase traffic and congestion at the intersections if improvements do not occur. Roundabouts are designed to maintain a constant flow of traffic through the intersection which results in reduced congestion on roadways and a reduction in delays for drivers.
428	The preliminary investigation and engineering traffic study was completed to evaluate the Greenbag Road corridor, evaluating the existing and potential future operation of the intersections selected for study by WVDOH. The Greenbag Road corridor has long been recognized as a challenging roadway to navigate due to geometric deficiencies, significant intersection delays during the peak hours, and increased volume of truck traffic and development within the corridor. Several studies have been previously completed through the MMMPO, evaluating various transportation plans for the Greenbag Road corridor, with the ultimate vision of transforming Greenbag Road into a safe, efficient, and attractive multimodal transportation facility. It should be noted that the traffic evaluation was completed prior to the COVID-19 pandemic and its effects to traffic currently occurring. The EA reviewed multiple alternatives including turn lanes, traffic lights, and the roundabouts. Through the analysis in the EA, the only alternative that meets the purpose and need of the project is the roundabout. The traffic control plan, which will outline the intended traffic detour tour, will continue to be revised during final design. It should be noted that Aaron's Creek Road will not be utilized as a signed detour. The anticipated plan intends to utilize the center of the Dorsey Avenue /Kingwood Pike roundabout as a temporary intersection with temporary traffic signals during construction. A short-term detour is proposed using Summers School Road while constructing the connection of the existing Kingwood Pike with the new portion.
429	The EA reviewed multiple alternatives including turn lanes, traffic lights, and the roundabouts. Through the analysis in the EA, the only alternative that meets the purpose and need of the project is the roundabout.
430	The preliminary investigation and engineering traffic study has examined two build alternatives and three options for each of the major intersections. The intersection options that were evaluated and analyzed include turning lanes, traffic signals, and roundabouts. WVDOH requires intersection improvements to meet or exceed an overall intersection LOS C or better during the peak hours studied for design year improvements. The times of day (peak hours) selected to be studied followed WVDOH guidelines and is standard traffic engineering practice for determining future intersection improvements. At the intersection of Greenbag Road/Dorsey Avenue/Kingwood Pike the traffic analysis determined that the intersection would operate at failure (overall intersection LOS F) if existing intersection conditions and operations were to remain the same 30-years in the future (design year) without any improvements. Adding only left turn lanes on Greenbag Road at the Dorsey/Kingwood Pike intersection was evaluated during an initial round of traffic analysis because this option had been suggested by the MPO. The option included upgrading the signal lights to have a protected/permissive left turn phase. The analysis showed that this option would result in some intersection improvements but could not achieve LOS C or better for the overall intersection operation. The overall intersection would operate at an unacceptable LOS (LOS E). In addition, the left turn lane option would result in the eastbound Greenbag Road traffic queue to extend past the Bluegrass Village Driveway.

	The traffic analysis determined that with installation of a roundabout the overall intersection would operate at a LOS C, meeting WVDOH design year criteria. One of the major differences between Greenbag Road and the Mileground, is the volume of traffic. Greenbag Road has less than half the traffic volume that Mileground has. A second major difference is the general configuration of the roundabouts. The proposed roundabouts on Greenbag are more straightforward and more traditional roundabout designs, without all of the confusing lanes that are present at Mileground. The roundabouts on Greenbag Road will be more intuitive for drivers. Every roundabout is designed and adapted to the context of its location. The traffic control plan, which will outline the intended traffic detour tour, will continue to be revised during final design. It should be noted that Aaron's Creek Road will not be utilized as a signed detour. The anticipated plan intends to utilize the center of the Dorsey Avenue /Kingwood Pike roundabout as a temporary intersection with temporary traffic signals during construction. A short-term detour is proposed using Summers School Road while constructing the connection of the existing Kingwood Pike with the new portion.
431	The EA reviewed multiple alternatives including turn lanes, traffic lights, and the roundabouts. Through the analysis in the EA, the only alternative that meets the purpose and need of the project is the roundabout. Conscious Harvest Cooperative Community Garden, Joy and Hemp Universal LLC, and Mockingbird Hill Farms are located on private property and the property owner will be compensated for the sale of any land to the WVDOH during the right-of-way acquisition process. Impacts to this parcel have been minimized to the extent practicable. Approximately 1.56 acres (67,900 square feet) will be required from the parcel. Fair market value will be paid for all properties that require full or partial acquisition as a result of the project. When only part of the property is required, as is the case with this parcel, fair market value of the part taken will be paid, plus damages, if any, to the residue, less all benefits. West Virginia law defines "market value" as the price a willing buyer would pay a willing seller, neither acting under compulsion nor duress, both exercising prudence and intelligent judgment as to its value and familiar with the purpose for which the property is reasonably available. Fair market value will be determined by a competent, professional real estate appraiser after a thorough inspection of the property, a comparison with similar properties in the area that have been sold recently, a determination and consideration of its replacement cost and depreciation and consideration of the income-producing potential. All appraisal reports are office-reviewed, then rechecked in the field by experienced, qualified review appraisers for accuracy. Since the Division of Highways has adopted a firm price policy, the property owner will be offered the full amount of the approved appraisal. There will be no attempt to buy property at less than fair market value. This policy guarantees that all citizens of the state receive full value for the money expended for highway rights of way. Those who hold a valid property interest in the property that is acquired for the project will be compensated during the ROW acquisition phase.
432	The EA reviewed multiple alternatives including turn lanes, traffic lights, and the roundabouts. Through the analysis in the EA, the only alternative that meets the purpose and need of the project is the roundabout. Parking garages are outside the scope of the current project.

433	The EA reviewed multiple alternatives including turn lanes, traffic lights, and the roundabouts. Through the analysis in the EA, the only alternative that meets the purpose and need of the project is the roundabout. Conscious Harvest Cooperative Community Garden, Joy and Hemp Universal LLC, and Mockingbird Hill Farms are located on private property and the property owner will be compensated for the sale of any land to the WVDOH during the right-of-way acquisition process. In addition, the left turn lane option would result in the eastbound Greenbag Road traffic queue to extend past the Bluegrass Village Driveway. In regards to safety, a conventional 4-way intersection has 32 points of vehicle conflict due to vehicular maneuvers through the intersection. A roundabout has 8 points of vehicle conflict, which all occur in the same direction, reducing crash severity and likelihood of injury. Studies by the Federal Highway Administration (FHWA) have shown that roundabouts typically achieve reduction in overall collisions, injury collisions, fatality collisions, and pedestrian collisions. Reasons for these reductions due to the installation of a roundabout include: - Low travel speeds – Drivers must slow down and yield to traffic before entering a roundabout. The reduction in speeds results in a decrease in crash severity and injury.

	- No traffic light "to beat" – The design of a roundabout promotes a continuous circular flow of traffic. Because of this design, drivers will not have the incentive to speed up to "beat the light", like they may at a traditional intersection. - One way travel – The design of a roundabout directs drivers through gently designed curves into a one-way counterclockwise circular path. This design eliminates the possibilities for T-bone and head-on collisions. Conscious Harvest Cooperative Community Garden, Joy and Hemp Universal LLC, and Mockingbird Hill Farms are located on private property and the property owner will be compensated for the sale of any land to the WVDOH during the right-of-way acquisition process. Impacts to this parcel have been minimized to the extent practicable. Approximately 1.56 acres (67,900 square feet) will be required from the parcel. Fair market value will be paid for all properties that require full or partial acquisition as a result of the project. When only part of the property is required, as is the case with this parcel, fair market value of the part taken will be paid, plus damages, if any, to the residue, less all benefits. West Virginia law defines "market value" as the price a willing buyer would pay a willing seller, neither acting under compulsion nor duress, both exercising prudence and intelligent judgment as to its value and familiar with the purpose for which the property is reasonably available. Fair market value will be determined by a competent, professional real estate appraiser after a thorough inspection of the property, a comparison with similar properties in the area that have been sold recently, a determination and consideration of its replacement cost and depreciation and consideration of the income-producing potential. All appraisal reports are office-reviewed, then rechecked in the field by experienced, qualified review appraisers for accuracy. Since the Division of Highways has adopted a firm price policy, the property owner will be offered the full amount of the approved appraisal. There will be no attempt to buy property at less than fair market value. This policy guarantees that all citizens of the state receive full value for the money expended for highway rights of way. Those who hold a valid property interest in the property that is acquired for the project will be compensated during the ROW acquisition phase.
435	We appreciate your input regarding the project.
436	The EA reviewed multiple alternatives including turn lanes, traffic lights, and the roundabouts. Through the analysis in the EA, the only alternative that meets the purpose and need of the project is the roundabout. Conscious Harvest Cooperative Community Garden, Joy and Hemp Universal LLC, and Mockingbird Hill Farms are located on private property and the property owner will be compensated for the sale of any land to the WVDOH during the right-of-way acquisition process. Impacts to this parcel have been minimized to the extent practicable. Approximately 1.56 acres (67,900 square feet) will be required from the parcel. Fair market value will be paid for all properties that require full or partial acquisition as a result of the project. When only part of the property is required, as is the case with this parcel, fair market value of the part taken will be paid, plus damages, if any, to the residue, less all benefits. West Virginia law defines "market value" as the price a willing buyer would pay a willing seller, neither acting under compulsion nor duress, both exercising prudence and intelligent judgment as to its value and familiar with the purpose for which the property is reasonably available. Fair market value will be determined by a competent, professional real estate appraiser after a thorough inspection of the property, a comparison with similar properties in the area that have been sold recently, a determination and consideration of its replacement cost and depreciation and consideration of the income-producing potential. All appraisal reports are office-reviewed, then rechecked in the field by experienced, qualified

	review appraisers for accuracy. Since the Division of Highways has adopted a firm price policy, the property owner will be offered the full amount of the approved appraisal. There will be no attempt to buy property at less than fair market value. This policy guarantees that all citizens of the state receive full value for the money expended for highway rights of way. Those who hold a valid property interest in the property that is acquired for the project will be compensated during the ROW acquisition phase.
437	The preliminary investigation and engineering traffic study was completed to evaluate the Greenbag Road corridor, evaluating the existing and potential future operation of the intersections selected for study by WVDOH. The Greenbag Road corridor has long been recognized as a challenging roadway to navigate due to geometric deficiencies, significant intersection delays during the peak hours, and increased volume of truck traffic and development within the corridor. Several studies have been previously completed through the MMMPO, evaluating various transportation plans for the Greenbag Road corridor, with the ultimate vision of transforming Greenbag Road into a safe, efficient, and attractive multimodal transportation facility. It should be noted that the traffic evaluation was completed prior to the COVID-19 pandemic and its effects to traffic currently occurring. Road repair beyond the scope of this project is being addressed through the Governor's Roads to Prosperity program and progress can be tracked via the WVDOH website. Conscious Harvest Cooperative Community Garden, Joy and Hemp Universal LLC, and Mockingbird Hill Farms are located on private property and the property owner will be compensated for the sale of any land to the WVDOH during the right-of-way acquisition process. Impacts to this parcel have been minimized to the extent practicable. Approximately 1.56 acres (67,900 square feet) will be required from the parcel. Fair market value will be paid for all properties that require full or partial acquisition as a result of the project. When only part of the property is required, as is the case with this parcel, fair market value of the part taken will be paid, plus damages, if any, to the residue, less all benefits. Those who hold a valid property interest in the property that is acquired for the project will be compensated during the ROW acquisition phase.
438	We appreciate your input regarding the project.
439	The preliminary investigation and engineering traffic study was completed to evaluate the Greenbag Road corridor, evaluating the existing and potential future operation of the intersections selected for study by WVDOH. The Greenbag Road corridor has long been recognized as a

	challenging roadway to navigate due to geometric deficiencies, significant intersection delays during the peak hours, and increased volume of truck traffic and development within the corridor. Several studies have been previously completed through the MMMPO, evaluating various transportation plans for the Greenbag Road corridor, with the ultimate vision of transforming Greenbag Road into a safe, efficient, and attractive multimodal transportation facility. It should be noted that the traffic evaluation was completed prior to the COVID-19 pandemic and its effects to traffic currently occurring. The turn lane options that were examined do not improve the level of service as much as the roundabout at the intersection of Dorsey Avenue/Kingwood Pike. In addition, the turn lane option involves complete takes of 2 residences and 1 business. This change will be noted in the FONSI. Adding only left turn lanes on Greenbag Road at the Dorsey/Kingwood Pike intersection was evaluated during an initial round of traffic analysis because this option had been suggested by the MPO. The option included upgrading the signal lights to have a protected/permissive left turn phase. The analysis showed that this option would result in some intersection improvements but could not achieve LOS C or better for the overall intersection operation. It should be noted that LOS C is WVDOH's design year level of service criteria threshold for intersection improvements. The overall intersection would operate at an unacceptable level of service (LOS E). In addition, the left turn lane option would result in the eastbound Greenbag Road traffic queue to extend past the Bluegrass Village Driveway. In regards to safety, a conventional 4-way intersection has 32 points of vehicle conflict due to vehicular maneuvers through the intersection. A roundabout has 8 points of vehicle conflict, which all occur in the same direction, reducing crash severity and likelihood of injury. Studies by the Federal Highway Administration (FHWA) have shown that roundabouts typically achieve reduction in overall collisions, injury collisions, fatality collisions, and pedestrian collisions. Reasons for these reductions due to the installation of a roundabout include: - Low travel speeds – Drivers must slow down and yield to traffic before entering a roundabout. The reduction in speeds results in a decrease in crash severity and injury. - No traffic light "to beat" – The design of a roundabout promotes a continuous circular flow of traffic. Because of this design, drivers will not have the incentive to speed up to "beat the light", like they may at a traditional intersection. - One way travel – The design of a roundabout directs drivers through gently designed curves into a one-way counterclockwise circular path. This design eliminates the possibilities for T-bone and head-on collisions. The traffic control plan, which will outline the intended traffic detour tour, will continue to be revised during final design. It should be noted that Aaron's Creek Road will not be utilized as a signed detour. The anticipated plan intends to utilize the center of the Dorsey Avenue /Kingwood Pike roundabout as a temporary intersection with temporary traffic signals during construction. A short-term detour is proposed using Summers School Road while constructing the connection of the existing Kingwood Pike with the new portion. The roundabouts were designed to accommodate AASHTO WB-62 truck configuration, which is an interstate semi-truck with a 62' wheel base between steer axle and last trailer axle, including a 48' trailer. Larger trucks can navigate the roundabout and use the internal truck apron.
440	The turn lane options that were examined do not improve the level of service as much as the roundabout at the intersection of Dorsey Avenue/Kingwood Pike. In addition, the turn lane option involves complete takes of 2 residences and 1 business. This change will be noted in the FONSI. Adding only left turn lanes on Greenbag Road at the Dorsey/Kingwood Pike intersection was evaluated during an initial round of

	traffic analysis because this option had been suggested by the MPO. The option included upgrading the signal lights to have a protected/permissive left turn phase. The analysis showed that this option would result in some intersection improvements but could not achieve LOS C or better for the overall intersection operation. It should be noted that LOS C is WVDOH's design year level of service criteria threshold for intersection improvements. The overall intersection would operate at an unacceptable level of service (LOS E). In addition, the left turn lane option would result in the eastbound Greenbag Road traffic queue to extend past the Bluegrass Village Driveway. In regards to safety, a conventional 4-way intersection has 32 points of vehicle conflict due to vehicular maneuvers through the intersection. A roundabout has 8 points of vehicle conflict, which all occur in the same direction, reducing crash severity and likelihood of injury. This design eliminates the possibilities for T-bone and head-on collisions. Any property needed for the project will be acquired under the Uniform Relocation Assistance and Real Property Acquisition Act (1970) through negotiations with the landowners.
443	The cultural resources surveys were conducted according to the guidelines published by the WV State Historic Preservation Office. The archaeological survey included the excavation of 213 shovel test pits, one test excavation unit, and visual inspection of the entire surface area within the defined area of potential effect. Based on the SHPO guidelines, when no cultural resources are identified during the Phase I survey, an abbreviated technical report is acceptable. As the reviewing agency, the WV SHPO concurred with the recommendation that no further archaeological investigations were warranted and no archaeological historic properties are present in the study area. The historic structures survey resulted in the identification of 25 structures 45+ years old within the defined area of potential effect. Two of the resources were recommended eligible for the National Register of Historic Places and the project was designed to avoid potential impacts to these properties. As the reviewing agency, the WV SHPO concurred with the recommendation that the project would not adversely affect any NRHP eligible

	resources and that no further historic structures investigations were needed. The Morgantown Historic Landmarks Commission was notified of the project in a letter dated January 30, 2019. An email was received from the MHLC on February 13, 2019 stating that the boundaries of the project are outside MHLC jurisdiction and they did not have any comments. The correspondence is available in Appendix E of the Historic Structures Report.
444	Thank you for inquiring about the Greenbag Road Project, our project team looks forward to working with you. The Environmental Assessment (EA) was approved by Federal Highway Administration (FHWA) on August 28, 2020. The EA along with all the Virtual Public Meeting information can be found at: https://transportation.wv.gov/highways/engineering/comment/greenbagroadimprovementproject/Pages/default.aspx and https://www.publicinput.com/greenbag. If you have any questions about the Environmental Assessment or Engineering Design please contact our consultants Karen Reed at Markosky Engineering Group, Inc. (kreed@markosky.com) or Brian Hoffheins at Stahl Sheaffer Engineering (bhoffheins@sse-llc.com). If you are requesting a specific document you will need to submit a FOIA request. For any Right of Way questions please contact WVDOH District 4 Right of Way Agent, Raymond Tackett (Raymond.N.Tackett@wv.gov). Please submit comments on the project on or before October 29, 2020.
445	1. The West Virginia Division of Highways (WVDOH) does not “steal” property. Any property needed for the project will be acquired under the Uniform Relocation Assistance and Real Property Acquisition Act (1970). 2. Since 2006 the traffic volume on this road has increased requiring additional upgrades such as the current Greenbag Road Improvement Project. Additional right of way would be needed if widening were to occur as Mr. Kyle suggests. 3. The approved Environmental Assessment (EA) addresses the purpose and need due to traffic issues plus evaluates traffic noise impacts. No traffic noise impacts are identified. 4. Additional right of way is needed for a turn lane. The WVDOH and the Federal Highway Administration (FHWA) determined that an EA is the appropriate National Environmental Policy Act (NEPA) document for the Greenbag Road Project. 5. The EA was approved in the year 2020 using the current and most update data available. https://transportation.wv.gov/highways/engineering/comment/greenbagroadimprovementproject/Pages/default.aspx. 6. During the September 29, 2020 virtual public meeting, the WVDOH personnel mentioned during each presentation that live phone calls would not be taken. However, there is “leave a voicemail” option those would be transcribed. Any questions would be read, and comments would become part of the project record. There was a list of frequently asked questions with WVDOH responses on the website as well. The public was also informed during the public meeting that there would be a meeting summary included in the final environmental document. 7. The US Post Office has the responsibility for certified mail return receipts. 8. Properties impacted will be compensated as described in Uniform Relocation Assistance and Real Property Acquisition Act (1970). 9. As indicated in our response to Concern #2, since 2006 the traffic volume on this road has increased requiring additional upgrades such as the current Greenbag Road Project. The WVDOH and FHWA extended the comment period from October 29, 2020 to November 30, 2020 to provide the public more time to comment on the Greenbag Road Environmental Assessment.
446	We appreciate your input regarding the project.
447	We appreciate your input regarding the project.

448	The sidewalk design has been extended from the western end of the project area along Greenbag Road to the Dorsey Avenue/Kingwood Pike intersection. At the intersection the sidewalk follows Dorsey Avenue north to Luckey Lane and east on Luckey Lane to the connection with the existing sidewalk at Mountainview Elementary School. The shoulder along the north side of Greenbag Road is being designed to accommodate bicycle use by being wider (3 feet) than the standard shoulder (2 feet).
449	Conscious Harvest Cooperative Community Garden, Joy and Hemp Universal LLC, and Mockingbird Hill Farms are located on private property and the property owner will be compensated for the sale of any land to the WVDOH during the right-of-way acquisition process. Impacts to this parcel have been minimized to the extent practicable. Approximately 1.56 acres (67,900 square feet) will be required from the parcel. Fair market value will be paid for all properties that require full or partial acquisition as a result of the project. When only part of the property is required, as is the case with this parcel, fair market value of the part taken will be paid, plus damages, if any, to the residue, less all benefits. West Virginia law defines "market value" as the price a willing buyer would pay a willing seller, neither acting under compulsion nor duress, both exercising prudence and intelligent judgment as to its value and familiar with the purpose for which the property is reasonably available. Fair market value will be determined by a competent, professional real estate appraiser after a thorough inspection of the property, a comparison with similar properties in the area that have been sold recently, a determination and consideration of its replacement cost and depreciation and consideration of the income-producing potential. All appraisal reports are office-reviewed, then rechecked in the field by experienced, qualified review appraisers for accuracy. Since the Division of Highways has adopted a firm price policy, the property owner will be offered the full amount of the approved appraisal. There will be no attempt to buy property at less than fair market value. This policy guarantees that all citizens of the state receive full value for the money expended for highway rights of way. Those who hold a valid property interest in the property that is acquired for the project will be compensated during the ROW acquisition phase.
450	A shared-use path was part of some early versions of the project, but the right of way impacts along Bluegrass Village and the Kennedy Center were significant. Due to these detrimental impacts the shared use path was removed from the alternatives that were advanced to the EA. Thank you for enumerating the safety concerns and the proposed HAWK beacon. The WVDOH will examine all safety concerns as part of the final design. Moving the roundabout to the north into the former Atomic Grill location is not feasible given the topography and approach angles. The existing grade on Kingwood Pike requires stopping on a -6.5% grade at the traffic signal. The grade approaching the roundabout includes a flat grade of less than 2% at the roundabout. In the existing condition, the angle between Greenbag Road and Dorsey Avenue is 60° and in the proposed condition it is 74°, with closer to 90° being ideal.
451	The turn lane options that were examined do not improve the level of service as much as the roundabout at the intersection of Dorsey Avenue/Kingwood Pike. In addition, the turn lane option involves complete takes of 2 residences and 1 business. This change will be noted in the FONSI. Adding only left turn lanes on Greenbag Road at the Dorsey/Kingwood Pike intersection was evaluated during an initial round of traffic analysis because this option had been suggested by the MPO. The option included upgrading the signal lights to have a protected/permissive left turn phase. The analysis showed that this option would result in some intersection improvements but could not achieve LOS C or better for the overall intersection operation. It should be noted that LOS C is WVDOH's design year level of service criteria

	threshold for intersection improvements. The overall intersection would operate at an unacceptable level of service (LOS E). In addition, the left turn lane option would result in the eastbound Greenbag Road traffic queue to extend past the Bluegrass Village Driveway. In regards to safety, a conventional 4-way intersection has 32 points of vehicle conflict due to vehicular maneuvers through the intersection. A roundabout has 8 points of vehicle conflict, which all occur in the same direction, reducing crash severity and likelihood of injury. Studies by the Federal Highway Administration (FHWA) have shown that roundabouts typically achieve reduction in overall collisions, injury collisions, fatality collisions, and pedestrian collisions. Reasons for these reductions due to the installation of a roundabout include: - Low travel speeds – Drivers must slow down and yield to traffic before entering a roundabout. The reduction in speeds results in a decrease in crash severity and injury. - No traffic light "to beat" – The design of a roundabout promotes a continuous circular flow of traffic. Because of this design, drivers will not have the incentive to speed up to "beat the light", like they may at a traditional intersection. - One way travel – The design of a roundabout directs drivers through gently designed curves into a one-way counterclockwise circular path. This design eliminates the possibilities for T-bone and head-on collisions. The traffic control plan, which will outline the intended traffic detour tour, will continue to be revised during final design. It should be noted that Aaron's Creek Road will not be utilized as a signed detour. The anticipated plan intends to utilize the center of the Dorsey Avenue /Kingwood Pike roundabout as a temporary intersection with temporary traffic signals during construction. A short-term detour is proposed using Summers School Road while constructing the connection of the existing Kingwood Pike with the new portion. Changes to the interstate are outside the scope of the current project.
452	The preliminary investigation and engineering traffic study has examined two build alternatives and three options for each of the major intersections. The intersection options that were evaluated and analyzed include turning lanes, traffic signals, and roundabouts. WVDOH requires intersection improvements to meet or exceed an overall intersection LOS C or better during the peak hours studied for design year improvements. The times of day (peak hours) selected to be studied followed WVDOH guidelines and is standard traffic engineering practice for determining future intersection improvements. At the intersection of Greenbag Road/Dorsey Avenue/Kingwood Pike the traffic analysis determined that the intersection would operate at failure (overall intersection LOS F) if existing intersection conditions and operations were to remain the same 30-years in the future (design year) without any improvements. Adding only left turn lanes on Greenbag Road at the Dorsey/Kingwood Pike intersection was evaluated during an initial round of traffic analysis because this option had been suggested by the MPO. The option included upgrading the signal lights to have a protected/permissive left turn phase. The analysis showed that this option would result in some intersection improvements but could not achieve LOS C or better for the overall intersection operation. The overall intersection would operate at an unacceptable LOS (LOS E). In addition, the left turn lane option would result in the eastbound Greenbag Road traffic queue to extend past the Bluegrass Village Driveway. The traffic analysis determined that with installation of a roundabout the overall intersection would operate at a LOS C, meeting WVDOH design year criteria.

	At the intersection of Greenbag Road/Mississippi Avenue the traffic analysis determined that the intersection would operate at failure (overall intersection LOS F) if existing intersection conditions and operations were to remain the same 30-years in the future (design year) without any improvements. The design year with improvements scenarios evaluated determined that with installation of a roundabout the overall intersection would operate at a LOS A, best operating conditions, for all peak hours studied. Installation of a traffic signal with turn lanes resulted in an overall intersection LOS B during the AM peak hour, with the Mississippi Avenue approach operating at a LOS C. Though the analysis meets WVDOH minimum LOS criteria, the roundabout option exceeds WVDOH minimum LOS criteria. Roundabouts help reduce vehicular delay and promotes a continuous flow of traffic, which increases traffic capacity at an intersection.
453	Findings from the Environmental studies (aquatic resources such as streams and wetlands; rare, threatened and endangered species of plants and animals; floodplains; farmlands; groundwater; hazardous materials; air quality; and noise) that were conducted to evaluate impacts associated with the proposed project are documented in the EA. More information is available in the FONSI and EA appendices. The EA and appendices are available on the WVDOH website: https://transportation.wv.gov/highways/engineering/comment/closed/greenbagroadimprovementproject/Pages/default.aspx. The aquatic resources study was conducted based on the guiding manuals for wetland and stream identification. The wetland study adhered to the USACE Corps of Engineers Wetland Delineation Manual and the Regional Supplement to the Corps of Engineers Wetland Delineation Manual: Eastern Mountains and Piedmont Region. The stream identification and classification was based on the definitions from Title 46 and the West Virginia Surface Mining Rules. The study identified and delineated 8 palustrine wetlands and 13 jurisdictional watercourses within the project study area. Any changes to aquatic resource impacts in final design will be identified and included in the mitigation plan. The EA identifies wetland impacts for each alternative analyzed. Wetland impacts for alternative 1 are 0.06 acres (Palustrine Emergent 0.01 acres and Palustrine Forested 0.05 acres) and 0.05 acres for Alternative 2 (Palustrine Emergent 0.01 acres and Palustrine Forested 0.04 acres). Wetland impacts were additionally calculated for each of the intersection options: Option A is 0.05 acres (Palustrine Emergent), Option B is 0.05 acres (Palustrine Emergent) and Option C is 0.05 acres (Palustrine Emergent). No wetland impacts were identified for Options D, E, and F. The EA for the project identifies the intermittent and permanent stream impacts for each alternative analyzed. The stream impacts were determined for the EA based on the limit of disturbance provided and did not include culverted, relocated or stream loss lengths. The type of intermittent and permanent stream impacts identified for each alternative are similar. The total stream impacts for Option A is 500 LF and Options B and C are 521 LF. The total stream impacts for Option D is 428 LF, Option B is 433 LF and Option C is 453 LF. The level of detail to determine the type of stream impact including culverted, relocated, and stream loss, for the preferred alternative will be further analyzed in Final design. Options to further reduce impacts to the streams for the preferred alternative will need to be considered during Final Design. The analysis for water quality and quantity will also be further analyzed during Final Design. A detailed stream assessment will also be performed for the streams that will be impacted for the preferred alternative. Coordination with the DEP and the USACE will occur in final design and the applicable waterway permit will be obtained for the project.

	During final design, further avoidance and/or minimization measures will be considered and/or implemented as appropriate to reduce the total impacts to streams. Specific Best Management Practices will be developed prior to construction to reduce the amount of disturbed aquatic habitat and riparian vegetation; minimize opportunities for increased sedimentation during construction; revegetate all disturbed areas to prevent accelerated erosion; designate equipment fueling and service areas away from aquatic habitats; and designate and construct all stormwater management facilities to prevent runoff. Coordination with resource agencies will continue throughout construction activities as necessary. The stormwater management plan for this project will meet the volume and rate requirements of the Morgantown Utility Board and WVDOH policies. Due to the existing topography and features it is likely that these requirements will require basins and other stormwater BMP's, such as vegetated swales. The amount of offsite runoff to the streams and wetlands will be minimized where practicable in order to limit basin size and meet the design criteria. Stormwater design for the project will be completed during final design and will minimize the impacts to the streams and wetlands located within and adjacent to the project right of way. The EA reported impacts to Federal Farmland Protection Policy Act (FPPA) soils. The entire Greenbag Road environmental study area is encompassed by "land already in or committed to urban development" as defined by the FPPA (see 7 CFR § 658.2 - Definitions) and is therefore not subject to provisions of FPPA. Please refer to the Farmland Appendix attached to the FONSI for further detail. Conscious Harvest Cooperative Community Garden, Joy and Hemp Universal LLC, and Mockingbird Hill Farms are located on private property and the property owner will be compensated for the sale of any land to the WVDOH during the right-of-way acquisition process. Impacts to this parcel have been minimized to the extent practicable. Approximately 1.56 acres (67,900 square feet) will be required from the parcel. Fair market value will be paid for all properties that require full or partial acquisition as a result of the project. When only part of the property is required, as is the case with this parcel, fair market value of the part taken will be paid, plus damages, if any, to the residue, less all benefits. West Virginia law defines "market value" as the price a willing buyer would pay a willing seller, neither acting under compulsion nor duress, both exercising prudence and intelligent judgment as to its value and familiar with the purpose for which the property is reasonably available. Fair market value will be determined by a competent, professional real estate appraiser after a thorough inspection of the property, a comparison with similar properties in the area that have been sold recently, a determination and consideration of its replacement cost and depreciation and consideration of the income-producing potential. All appraisal reports are office-reviewed, then rechecked in the field by experienced, qualified review appraisers for accuracy. Since the Division of Highways has adopted a firm price policy, the property owner will be offered the full amount of the approved appraisal. There will be no attempt to buy property at less than fair market value. This policy guarantees that all citizens of the state receive full value for the money expended for highway rights of way. Those who hold a valid property interest in the property that is acquired for the project will be compensated during the ROW acquisition phase. The option proposed here was one of the options suggested by the MMMPO study (adding left turn lanes only on Greenbag Rd at the Dorsey/Kingwood Pike) and was included on the first round of traffic analysis submitted to the WVDOH in February of 2019. This scenario also included upgrading the existing 2-phase traffic signal to 3-phases to incorporate a protected/permissive left turn phase. Installation of the turn lanes and modifying the signal phasing resulted in various approach and overall intersection LOS improvements; however, LOS C or better for

	the overall intersection operation could not be achieved. It was projected that some movements and the overall intersection would operate at an unacceptable level of service (LOS E or F). During the PM peak hour, the overall intersection is projected to operate at an overall intersection LOS E, and the eastbound through movement is forecasted to operate at a LOS F. This option would result in the Greenbag Road and Dorsey Avenue approaches queue lengths increasing. The eastbound Greenbag Road through movement queue will continue to extend past the Bluegrass Village driveway. Based on these findings and at the direction of the WVDOH, the traffic analysis was revised using additional options, which developed into Options D and E examined for the EA. The left turn lane only on Greenbag Road was not developed further and no impacts were assessed for the EA.
454	A shared-use path was part of some early versions of the project, but the right of way impacts along Bluegrass Village and the Kennedy Center were significant. Due to these detrimental impacts the shared use path was removed from the alternatives that were advanced to the EA. Thank you for enumerating the safety concerns and the proposed HAWK beacon. The WVDOH will examine all safety concerns as part of the final design. The turn lane options that were examined do not improve the level of service as much as the roundabout at the intersection of Dorsey Avenue/Kingwood Pike. In addition, the turn lane option involves complete takes of 2 residences and 1 business. This change will be noted in the FONSI. Adding only left turn lanes on Greenbag Road at the Dorsey/Kingwood Pike intersection was evaluated during an initial round of traffic analysis because this option had been suggested by the MPO. The option included upgrading the signal lights to have a protected/permissive left turn phase. The analysis showed that this option would result in some intersection improvements but could not achieve LOS C or better for the overall intersection operation. It should be noted that LOS C is WVDOH's design year level of service criteria threshold for intersection improvements. The overall intersection would operate at an unacceptable level of service (LOS E). In addition, the left turn lane option would result in the eastbound Greenbag Road traffic queue to extend past the Bluegrass Village Driveway. In regards to safety, a conventional 4-way intersection has 32 points of vehicle conflict due to vehicular maneuvers through the intersection. A roundabout has 8 points of vehicle conflict, which all occur in the same direction, reducing crash severity and likelihood of injury. Studies by the Federal Highway Administration (FHWA) have shown that roundabouts typically achieve reduction in overall collisions, injury collisions, fatality collisions, and pedestrian collisions. Reasons for these reductions due to the installation of a roundabout include: - Low travel speeds – Drivers must slow down and yield to traffic before entering a roundabout. The reduction in speeds results in a decrease in crash severity and injury. - No traffic light "to beat" – The design of a roundabout promotes a continuous circular flow of traffic. Because of this design, drivers will not have the incentive to speed up to "beat the light", like they may at a traditional intersection. - One way travel – The design of a roundabout directs drivers through gently designed curves into a one-way counterclockwise circular path. This design eliminates the possibilities for T-bone and head-on collisions. The EA reported impacts to Federal Farmland Protection Policy Act (FPPA) soils. The entire Greenbag Road environmental study area is encompassed by "land already in or committed to urban development" as defined by the FPPA (see 7 CFR § 658.2 - Definitions) and is therefore not subject to provisions of FPPA. Please refer to the Farmland Appendix attached to the FONSI for further detail.

	Conscious Harvest Cooperative Community Garden, Joy and Hemp Universal LLC, and Mockingbird Hill Farms are located on private property and the property owner will be compensated for the sale of any land to the WVDOH during the right-of-way acquisition process. Impacts to this parcel have been minimized to the extent practicable. Approximately 1.56 acres (67,900 square feet) will be required from the parcel. Fair market value will be paid for all properties that require full or partial acquisition as a result of the project. When only part of the property is required, as is the case with this parcel, fair market value of the part taken will be paid, plus damages, if any, to the residue, less all benefits. West Virginia law defines "market value" as the price a willing buyer would pay a willing seller, neither acting under compulsion nor duress, both exercising prudence and intelligent judgment as to its value and familiar with the purpose for which the property is reasonably available. Fair market value will be determined by a competent, professional real estate appraiser after a thorough inspection of the property, a comparison with similar properties in the area that have been sold recently, a determination and consideration of its replacement cost and depreciation and consideration of the income-producing potential. All appraisal reports are office-reviewed, then rechecked in the field by experienced, qualified review appraisers for accuracy. Since the Division of Highways has adopted a firm price policy, the property owner will be offered the full amount of the approved appraisal. There will be no attempt to buy property at less than fair market value. This policy guarantees that all citizens of the state receive full value for the money expended for highway rights of way. Those who hold a valid property interest in the property that is acquired for the project will be compensated during the ROW acquisition phase.
455	The EA reviewed multiple alternatives including turn lanes, traffic lights, and the roundabouts. Through the analysis in the EA, the only alternative that meets the purpose and need of the project is the roundabout. The turn lane options that were examined do not improve the level of service as much as the roundabout at the intersection of Dorsey Avenue/Kingwood Pike. In addition, the turn lane option involves complete takes of 2 residences and 1 business. This change will be noted in the FONSI. Adding only left turn lanes on Greenbag Road at the Dorsey/Kingwood Pike intersection was evaluated during an initial round of traffic analysis because this option had been suggested by the MPO. The option included upgrading the signal lights to have a protected/permissive left turn phase. The analysis showed that this option would result in some intersection improvements but could not achieve LOS C or better for the overall intersection operation. It should be noted that LOS C is WVDOH's design year level of service criteria threshold for intersection improvements. The overall intersection would operate at an unacceptable level of service (LOS E). In addition, the left turn lane option would result in the eastbound Greenbag Road traffic queue to extend past the Bluegrass Village Driveway. In regards to safety, a conventional 4-way intersection has 32 points of vehicle conflict due to vehicular maneuvers through the intersection. A roundabout has 8 points of vehicle conflict, which all occur in the same direction, reducing crash severity and likelihood of injury. Studies by the Federal Highway Administration (FHWA) have shown that roundabouts typically achieve reduction in overall collisions, injury collisions, fatality collisions, and pedestrian collisions. Reasons for these reductions due to the installation of a roundabout include: - Low travel speeds – Drivers must slow down and yield to traffic before entering a roundabout. The reduction in speeds results in a decrease in crash severity and injury. - No traffic light "to beat" – The design of a roundabout promotes a continuous circular flow of traffic. Because of this design, drivers will not have the incentive to speed up to "beat the light", like they may at a traditional intersection.

	- One way travel – The design of a roundabout directs drivers through gently designed curves into a one-way counterclockwise circular path. This design eliminates the possibilities for T-bone and head-on collisions. The traffic control plan, which will outline the intended traffic detour tour, will continue to be revised during final design. It should be noted that Aaron's Creek Road will not be utilized as a signed detour. The anticipated plan intends to utilize the center of the Dorsey Avenue /Kingwood Pike roundabout as a temporary intersection with temporary traffic signals during construction. A short-term detour is proposed using Summers School Road while constructing the connection of the existing Kingwood Pike with the new portion. Road repair beyond the scope of this project is being addressed through the Governor's Roads to Prosperity program and progress can be tracked via the WVDOH website.
456	The preliminary investigation and engineering traffic study was completed to evaluate the Greenbag Road corridor, evaluating the existing and potential future operation of the intersections selected for study by WVDOH. The evaluation of existing roadway conditions, including the existing roadway conditions of Kingwood Pike, was not part of the preliminary investigation and engineering traffic study. The Greenbag Road corridor has long been recognized as a challenging roadway to navigate due to geometric deficiencies, significant intersection delays during the peak hours, and increased volume of truck traffic and development within the corridor. Several studies have been previously completed through the MMMPO, evaluating various transportation plans for the Greenbag Road corridor, with the ultimate vision of transforming Greenbag Road into a safe, efficient, and attractive multimodal transportation facility. The future traffic along Greenbag Road, Mississippi Avenue, Dorsey Avenue, Kingwood Pike were projected for the future design year by assuming existing traffic distribution/patterns but with increased traffic volumes though application of a yearly traffic growth rate of 1.16% per year. It should be noted that the traffic evaluation was completed prior to the COVID-19 pandemic and its effects to traffic currently occurring. The traffic control plan, which will outline the intended traffic detour tour, will continue to be revised during final design. It should be noted that Aaron's Creek Road will not be utilized as a signed detour. The anticipated plan intends to utilize the center of the Dorsey Avenue /Kingwood Pike roundabout as a temporary intersection with temporary traffic signals during construction. A short-term detour is proposed using Summers School Road while constructing the connection of the existing Kingwood Pike with the new portion. The EA reported impacts to Federal Farmland Protection Policy Act (FPPA) soils. The entire Greenbag Road environmental study area is encompassed by "land already in or committed to urban development" as defined by the FPPA (see 7 CFR § 658.2 - Definitions) and is therefore not subject to provisions of FPPA. Please refer to the Farmland Appendix attached to the FONSI for further detail. Conscious Harvest Cooperative Community Garden, Joy and Hemp Universal LLC, and Mockingbird Hill Farms are located on private property and the property owner will be compensated for the sale of any land to the WVDOH during the right-of-way acquisition process. Impacts to this parcel have been minimized to the extent practicable. Approximately 1.56 acres (67,900 square feet) will be required from the parcel. Fair market value will be paid for all properties that require full or partial acquisition as a result of the project. When only part of the property is required, as is the case with this parcel, fair market value of the part taken will be paid, plus damages, if any, to the residue, less all benefits. West Virginia law defines "market value" as the price a willing buyer would pay a willing seller, neither acting under compulsion nor duress, both

	exercising prudence and intelligent judgment as to its value and familiar with the purpose for which the property is reasonably available. Fair market value will be determined by a competent, professional real estate appraiser after a thorough inspection of the property, a comparison with similar properties in the area that have been sold recently, a determination and consideration of its replacement cost and depreciation and consideration of the income-producing potential. All appraisal reports are office-reviewed, then rechecked in the field by experienced, qualified review appraisers for accuracy. Since the Division of Highways has adopted a firm price policy, the property owner will be offered the full amount of the approved appraisal. There will be no attempt to buy property at less than fair market value. This policy guarantees that all citizens of the state receive full value for the money expended for highway rights of way. Those who hold a valid property interest in the property that is acquired for the project will be compensated during the ROW acquisition phase. Road repair beyond the scope of this project is being addressed through the Governor's Roads to Prosperity program and progress can be tracked via the WVDOH website.
457	The preliminary investigation and engineering traffic study was completed to evaluate the Greenbag Road corridor, evaluating the existing and potential future operation of the intersections selected for study by WVDOH. The Greenbag Road corridor has long been recognized as a challenging roadway to navigate due to geometric deficiencies, significant intersection delays during the peak hours, and increased volume of truck traffic and development within the corridor. Several studies have been previously completed through the MMMPO, evaluating various transportation plans for the Greenbag Road corridor, with the ultimate vision of transforming Greenbag Road into a safe, efficient, and attractive multimodal transportation facility. The future traffic along Greenbag Road, Mississippi Avenue, Dorsey Avenue, Kingwood Pike were projected for the future design year by assuming existing traffic distribution/patterns but with increased traffic volumes though application of a yearly traffic growth rate of 1.16% per year. It should be noted that the traffic evaluation was completed prior to the COVID-19 pandemic and its effects to traffic currently occurring. Road repair beyond the scope of this project is being addressed through the Governor's Roads to Prosperity program and progress can be tracked via the WVDOH website. One of the major differences between Greenbag Road and the Mileground, is the volume of traffic. Greenbag Road has less than half the traffic volume that Mileground has. A second major difference is the general configuration of the roundabouts. The proposed roundabouts on Greenbag are more straightforward and more traditional roundabout designs, without all of the confusing lanes that are present at Mileground. The roundabouts on Greenbag Road will be more intuitive for drivers. Every roundabout is designed and adapted to the context of its location. The traffic control plan, which will outline the intended traffic detour tour, will continue to be revised during final design. It should be noted that Aaron's Creek Road will not be utilized as a signed detour. The anticipated plan intends to utilize the center of the Dorsey Avenue /Kingwood Pike roundabout as a temporary intersection with temporary traffic signals during construction. A short-term detour is proposed using Summers School Road while constructing the connection of the existing Kingwood Pike with the new portion. The diversion of traffic from downtown, including large trucks, is not within the scope of this project.

458	The EA reviewed multiple alternatives including turn lanes, traffic lights, and the roundabouts. Through the analysis in the EA, the only alternative that meets the purpose and need of the project is the roundabout. The turn lane options that were examined do not improve the level of service as much as the roundabout at the intersection of Dorsey Avenue/Kingwood Pike. In addition, the turn lane option involves complete takes of 2 residences and 1 business. These takes are different from what was reported in the EA. This change will be noted in the FONSI. Adding only left turn lanes on Greenbag Road at the Dorsey/Kingwood Pike intersection was evaluated during an initial round of traffic analysis because this option had been suggested by the MPO. The option included upgrading the signal lights to have a protected/permissive left turn phase. The analysis showed that this option would result in some intersection improvements but could not achieve LOS C or better for the overall intersection operation. It should be noted that LOS C is WVDOH's design year level of service criteria threshold for intersection improvements. The overall intersection would operate at an unacceptable level of service (LOS E). In addition, the left turn lane option would result in the eastbound Greenbag Road traffic queue to extend past the Bluegrass Village Driveway. Roundabouts are designed to slow speeds in the approach and through the roundabout allowing drivers more response time and limiting the number of potential directions where traffic could approach. A conventional 4-way intersection has 32 points of vehicle conflict due to vehicular maneuvers through the intersection. A roundabout has 8 points of vehicle conflict, which all occur in the same direction, reducing crash severity and likelihood of injury. Studies by the Federal Highway Administration (FHWA) have shown that roundabouts typically achieve reduction in overall collisions, injury collisions, fatality collisions, and pedestrian collisions. Reasons for these reductions due to the installation of a roundabout include: - Low travel speeds – Drivers must slow down and yield to traffic before entering a roundabout. The reduction in speeds results in a decrease in crash severity and injury. - No traffic light "to beat" – The design of a roundabout promotes a continuous circular flow of traffic. Because of this design, drivers will not have the incentive to speed up to "beat the light", like they may at a traditional intersection. - One way travel – The design of a roundabout directs drivers through gently designed curves into a one-way counterclockwise circular path. This design eliminates the possibilities for T-bone and head-on collisions. Roadway drainage issues will be addressed within the project area. The roundabouts were designed to accommodate AASHTO WB-62 truck configuration, which is an interstate semi-truck with a 62' wheel base between steer axle and last trailer axle, including a 48' trailer. Larger trucks can navigate the roundabout and use the internal truck apron. The EA reported impacts to Federal Farmland Protection Policy Act (FPPA) soils. The entire Greenbag Road environmental study area is encompassed by "land already in or committed to urban development" as defined by the FPPA (see 7 CFR § 658.2 - Definitions) and is therefore not subject to provisions of FPPA. Please refer to the Farmland Appendix attached to the FONSI for further detail. Conscious Harvest Cooperative Community Garden, Joy and Hemp Universal LLC, and Mockingbird Hill Farms are located on private property and the property owner will be compensated for the sale of any land to the WVDOH during the right-of-way acquisition process. Impacts to this parcel have been minimized to the extent practicable. Approximately 1.56 acres (67,900 square feet) will be required from the parcel.

	Fair market value will be paid for all properties that require full or partial acquisition as a result of the project. When only part of the property is required, as is the case with this parcel, fair market value of the part taken will be paid, plus damages, if any, to the residue, less all benefits. West Virginia law defines "market value" as the price a willing buyer would pay a willing seller, neither acting under compulsion nor duress, both exercising prudence and intelligent judgment as to its value and familiar with the purpose for which the property is reasonably available. Fair market value will be determined by a competent, professional real estate appraiser after a thorough inspection of the property, a comparison with similar properties in the area that have been sold recently, a determination and consideration of its replacement cost and depreciation and consideration of the income-producing potential. All appraisal reports are office-reviewed, then rechecked in the field by experienced, qualified review appraisers for accuracy. Since the Division of Highways has adopted a firm price policy, the property owner will be offered the full amount of the approved appraisal. There will be no attempt to buy property at less than fair market value. This policy guarantees that all citizens of the state receive full value for the money expended for highway rights of way. Those who hold a valid property interest in the property that is acquired for the project will be compensated during the ROW acquisition phase. The traffic control plan, which will outline the intended traffic detour tour, will continue to be revised during final design. It should be noted that Aaron's Creek Road will not be utilized as a signed detour. The anticipated plan intends to utilize the center of the Dorsey Avenue /Kingwood Pike roundabout as a temporary intersection with temporary traffic signals during construction. A short-term detour is proposed using Summers School Road while constructing the connection of the existing Kingwood Pike with the new portion.
459	The EA reviewed multiple alternatives including turn lanes, traffic lights, and the roundabouts. Through the analysis in the EA, the only alternative that meets the purpose and need of the project is the roundabout.
460	Roundabouts are designed to maintain a constant flow of traffic through the intersection which results in reduced congestion on roadways and a reduction in delays for drivers. Studies have shown that changing signalized intersections to roundabouts can have up to an 89% average reduction in vehicle delays. The improved traffic flow also results in reduced vehicle emissions including carbon monoxide, nitrous oxide, and carbon dioxide at the intersection. The noise analysis report indicates the Greenbag Road and intersection improvements for this alternative do not meet the requirements for either a Type I or Type II project. The Project is classified as a Type III project and a detailed noise analysis for highway traffic noise impacts was not required. The Type III noise analysis is available as an Appendix to the EA on the WVDOH website at https://transportation.wv.gov/highways/engineering/comment/closed/greenbagroadimprovementproject/Pages/default.aspx. The MMMPO had completed several previous studies evaluating various transportation plans for the Greenbag Road corridor, with the ultimate vision of transforming Greenbag Road into a safe, efficient, and attractive multimodal transportation facility. The scenarios determined to be evaluated in the traffic study evolved from the outcome of the MMMPO's preliminary studies and findings. Existing two-way stop controlled operations with potential roadway improvements were evaluated as part of the traffic, as well as traffic signal and roundabout options. The intersection of Greenbag Road/Dorsey Avenue/Kingwood Pike is currently controlled by a traffic signal and not by a four-way (all-way) stop, which includes stop sign control on each approach. The intersection would operate at failure (overall intersection LOS F) if existing

	intersection conditions and operations (traffic signal control) were to remain the same 30-years in the future (design year) without any improvements. Therefore, traffic analysis was not completed for a four-way (all-way) stop controlled intersection operations. Conscious Harvest Cooperative Community Garden, Joy and Hemp Universal LLC, and Mockingbird Hill Farms are located on private property and the property owner will be compensated for the sale of any land to the WVDOH during the right-of-way acquisition process. Impacts to this parcel have been minimized to the extent practicable. Approximately 1.56 acres (67,900 square feet) will be required from the parcel. Fair market value will be paid for all properties that require full or partial acquisition as a result of the project. When only part of the property is required, as is the case with this parcel, fair market value of the part taken will be paid, plus damages, if any, to the residue, less all benefits. West Virginia law defines "market value" as the price a willing buyer would pay a willing seller, neither acting under compulsion nor duress, both exercising prudence and intelligent judgment as to its value and familiar with the purpose for which the property is reasonably available. Fair market value will be determined by a competent, professional real estate appraiser after a thorough inspection of the property, a comparison with similar properties in the area that have been sold recently, a determination and consideration of its replacement cost and depreciation and consideration of the income-producing potential. All appraisal reports are office-reviewed, then rechecked in the field by experienced, qualified review appraisers for accuracy. Since the Division of Highways has adopted a firm price policy, the property owner will be offered the full amount of the approved appraisal. There will be no attempt to buy property at less than fair market value. This policy guarantees that all citizens of the state receive full value for the money expended for highway rights of way. Those who hold a valid property interest in the property that is acquired for the project will be compensated during the ROW acquisition phase.
461	The preliminary investigation and engineering traffic study has examined two build alternatives and three options for each of the major intersections. The intersection options that were evaluated and analyzed include turning lanes, traffic signals, and roundabouts. WVDOH requires intersection improvements to meet or exceed an overall intersection LOS C or better during the peak hours studied for design year improvements. The times of day (peak hours) selected to be studied followed WVDOH guidelines and is standard traffic engineering practice for determining future intersection improvements. At the intersection of Greenbag Road/Dorsey Avenue/Kingwood Pike the traffic analysis determined that the intersection would operate at failure (overall intersection LOS F) if existing intersection conditions and operations were to remain the same 30-years in the future (design year) without any improvements. Adding only left turn lanes on Greenbag Road at the Dorsey/Kingwood Pike intersection was evaluated during an initial round of traffic analysis because this option had been suggested by the MPO. The option included upgrading the signal lights to have a protected/permissive left turn phase. The analysis showed that this option would result in some intersection improvements but could not achieve LOS C or better for the overall intersection operation. The overall intersection would operate at an unacceptable LOS (LOS E). In addition, the left turn lane option would result in the eastbound Greenbag Road traffic queue to extend past the Bluegrass Village Driveway. The traffic analysis determined that with installation of a roundabout the overall intersection would operate at a LOS C, meeting WVDOH design year criteria. At the intersection of Greenbag Road/Mississippi Avenue the traffic analysis determined that the intersection would operate at failure (overall intersection LOS F) if existing intersection conditions and operations were to remain the same 30-years in the future (design year) without any

	improvements. The design year with improvements scenarios evaluated determined that with installation of a roundabout the overall intersection would operate at a LOS A, best operating conditions, for all peak hours studied. Installation of a traffic signal with turn lanes resulted in an overall intersection LOS B during the AM peak hour, with the Mississippi Avenue approach operating at a LOS C. Though the analysis meets WVDOH minimum LOS criteria, the roundabout option exceeds WVDOH minimum LOS criteria. Roundabouts help reduce vehicular delay and promotes a continuous flow of traffic, which increases traffic capacity at an intersection.
462	Both the MMMPO corridor study and the 2018 traffic study determined that traffic flow through the corridor is controlled by the congestion at the major intersections in the corridor. The projected growth in the Morgantown area will continue to increase traffic and congestion at the intersections if improvements do not occur. Roundabouts are designed to maintain a constant flow of traffic through the intersection which results in reduced congestion on roadways and a reduction in delays for drivers.
463	Both the MMMPO corridor study and the 2018 traffic study determined that traffic flow through the corridor is controlled by the congestion at the major intersections in the corridor. The projected growth in the Morgantown area will continue to increase traffic and congestion at the intersections if improvements do not occur. Roundabouts are designed to maintain a constant flow of traffic through the intersection which results in reduced congestion on roadways and a reduction in delays for drivers. Conscious Harvest Cooperative Community Garden, Joy and Hemp Universal LLC, and Mockingbird Hill Farms are located on private property and the property owner will be compensated for the sale of any land to the WVDOH during the right-of-way acquisition process. Impacts to this parcel have been minimized to the extent practicable. Approximately 1.56 acres (67,900 square feet) will be required from the parcel. Fair market value will be paid for all properties that require full or partial acquisition as a result of the project. When only part of the property is required, as is the case with this parcel, fair market value of the part taken will be paid, plus damages, if any, to the residue, less all benefits. West Virginia law defines “market value” as the price a willing buyer would pay a willing seller, neither acting under compulsion nor duress, both exercising prudence and intelligent judgment as to its value and familiar with the purpose for which the property is reasonably available. Fair market value will be determined by a competent, professional real estate appraiser after a thorough inspection of the property, a comparison with similar properties in the area that have been sold recently, a determination and consideration of its replacement cost and depreciation and consideration of the income-producing potential. All appraisal reports are office-reviewed, then rechecked in the field by experienced, qualified review appraisers for accuracy. Since the Division of Highways has adopted a firm price policy, the property owner will be offered the full amount of the approved appraisal. There will be no attempt to buy property at less than fair market value. This policy guarantees that all citizens of the state receive full value for the money expended for highway rights of way. Those who hold a valid property interest in the property that is acquired for the project will be compensated during the ROW acquisition phase.
464	The EA reported impacts to Federal Farmland Protection Policy Act (FPPA) soils. The entire Greenbag Road environmental study area is encompassed by “land already in or committed to urban development” as defined by the FPPA (see 7 CFR § 658.2 - Definitions) and is therefore not subject to provisions of FPPA. Please refer to the Farmland Appendix attached to the FONSI for further detail. LESA criteria are used under the FPPA. An FPPA review of the project shows that the entire project corridor is within land designated as urbanized area on the

	US Census Bureau Map and is considered land already in or committed to urban development by the act. Therefore, the Land Evaluation and Site Assessment is not applicable to this project. Conscious Harvest Cooperative Community Garden, Joy and Hemp Universal LLC, and Mockingbird Hill Farms are located on private property and the property owner will be compensated for the sale of any land to the WVDOH during the right-of-way acquisition process. Impacts to this parcel have been minimized to the extent practicable. Approximately 1.56 acres (67,900 square feet) will be required from the parcel. Fair market value will be paid for all properties that require full or partial acquisition as a result of the project. When only part of the property is required, as is the case with this parcel, fair market value of the part taken will be paid, plus damages, if any, to the residue, less all benefits. West Virginia law defines "market value" as the price a willing buyer would pay a willing seller, neither acting under compulsion nor duress, both exercising prudence and intelligent judgment as to its value and familiar with the purpose for which the property is reasonably available. Fair market value will be determined by a competent, professional real estate appraiser after a thorough inspection of the property, a comparison with similar properties in the area that have been sold recently, a determination and consideration of its replacement cost and depreciation and consideration of the income-producing potential. All appraisal reports are office-reviewed, then rechecked in the field by experienced, qualified review appraisers for accuracy. Since the Division of Highways has adopted a firm price policy, the property owner will be offered the full amount of the approved appraisal. There will be no attempt to buy property at less than fair market value. This policy guarantees that all citizens of the state receive full value for the money expended for highway rights of way. Those who hold a valid property interest in the property that is acquired for the project will be compensated during the ROW acquisition phase.
465	The EA reviewed multiple alternatives including turn lanes, traffic lights, and the roundabouts. Through the analysis in the EA, the only alternative that meets the purpose and need of the project is the roundabout.
466	The MMMPO had completed several previous studies evaluating various transportation plans for the Greenbag Road corridor, with the ultimate vision of transforming Greenbag Road into a safe, efficient, and attractive multimodal transportation facility. The scenarios determined to be evaluated in the traffic study evolved from the outcome of the MMMPO's preliminary studies and findings. Existing two-way stop controlled operations with potential roadway improvements were evaluated as part of the traffic study, as well as traffic signal and roundabout options. The preliminary investigation and engineering traffic study has examined two build alternatives and three options for each of the major intersections. The intersection options that were evaluated and analyzed include turning lanes, traffic signals, and roundabouts. WVDOH requires intersection improvements to meet or exceed an overall intersection LOS C or better during the peak hours studied for design year improvements. The times of day (peak hours) selected to be studied followed WVDOH guidelines and is standard traffic engineering practice for determining future intersection improvements. At the intersection of Greenbag Road/Dorsey Avenue/Kingwood Pike the traffic analysis determined that the intersection would operate at failure (overall intersection LOS F) if existing intersection conditions and operations were to remain the same 30-years in the future (design year) without any improvements. Adding only left turn lanes on Greenbag Road at the Dorsey/Kingwood Pike intersection was evaluated during an initial round of traffic analysis because this option had been suggested by the MPO. The option included upgrading the signal lights to have

	a protected/permissive left turn phase. The analysis showed that this option would result in some intersection improvements but could not achieve LOS C or better for the overall intersection operation. The overall intersection would operate at an unacceptable LOS (LOS E). In addition, the left turn lane option would result in the eastbound Greenbag Road traffic queue to extend past the Bluegrass Village Driveway. The traffic analysis determined that with installation of a roundabout the overall intersection would operate at a LOS C, meeting WVDOH design year criteria. At the intersection of Greenbag Road/Mississippi Avenue the traffic analysis determined that the intersection would operate at failure (overall intersection LOS F) if existing intersection conditions and operations were to remain the same 30-years in the future (design year) without any improvements. The design year with improvements scenarios evaluated determined that with installation of a roundabout the overall intersection would operate at a LOS A, best operating conditions, for all peak hours studied. Installation of a traffic signal with turn lanes resulted in an overall intersection LOS B during the AM peak hour, with the Mississippi Avenue approach operating at a LOS C. Though the analysis meets WVDOH minimum LOS criteria, the roundabout option exceeds WVDOH minimum LOS criteria. Roundabouts help reduce vehicular delay and promotes a continuous flow of traffic, which increases traffic capacity at an intersection. The traffic control plan, which will outline the intended traffic detour tour, will continue to be revised during final design. It should be noted that Aaron's Creek Road will not be utilized as a signed detour. The anticipated plan intends to utilize the center of the Dorsey Avenue /Kingwood Pike roundabout as a temporary intersection with temporary traffic signals during construction. A short-term detour is proposed using Summers School Road while constructing the connection of the existing Kingwood Pike with the new portion. Conscious Harvest Cooperative Community Garden, Joy and Hemp Universal LLC, and Mockingbird Hill Farms are located on private property and the property owner will be compensated for the sale of any land to the WVDOH during the right-of-way acquisition process. Impacts to this parcel have been minimized to the extent practicable. Approximately 1.56 acres (67,900 square feet) will be required from the parcel. Fair market value will be paid for all properties that require full or partial acquisition as a result of the project. When only part of the property is required, as is the case with this parcel, fair market value of the part taken will be paid, plus damages, if any, to the residue, less all benefits. West Virginia law defines "market value" as the price a willing buyer would pay a willing seller, neither acting under compulsion nor duress, both exercising prudence and intelligent judgment as to its value and familiar with the purpose for which the property is reasonably available. Fair market value will be determined by a competent, professional real estate appraiser after a thorough inspection of the property, a comparison with similar properties in the area that have been sold recently, a determination and consideration of its replacement cost and depreciation and consideration of the income-producing potential. All appraisal reports are office-reviewed, then rechecked in the field by experienced, qualified review appraisers for accuracy. Since the Division of Highways has adopted a firm price policy, the property owner will be offered the full amount of the approved appraisal. There will be no attempt to buy property at less than fair market value. This policy guarantees that all citizens of the state receive full value for the money expended for highway rights of way. Those who hold a valid property interest in the property that is acquired for the project will be compensated during the ROW acquisition phase.

	Road repair beyond the scope of this project is being addressed through the Governor's Roads to Prosperity program and progress can be tracked via the WVDOH website.
467	The WVDOH and FHWA will make the final decision regarding the Greenbag Road Improvement Project following completion of the public comment period. The traffic control plan, which will outline the intended traffic detour tour, will continue to be revised during final design. It should be noted that Aaron's Creek Road will not be utilized as a signed detour. The anticipated plan intends to utilize the center of the Dorsey Avenue /Kingwood Pike roundabout as a temporary intersection with temporary traffic signals during construction. A short-term detour is proposed using Summers School Road while constructing the connection of the existing Kingwood Pike with the new portion.
468	The turn lane options that were examined do not improve the level of service as much as the roundabout at the intersection of Dorsey Avenue/Kingwood Pike. In addition, the turn lane option involves complete takes of 2 residences and 1 business. This change will be noted in the FONSI. Adding only left turn lanes on Greenbag Road at the Dorsey/Kingwood Pike intersection was evaluated during an initial round of traffic analysis because this option had been suggested by the MPO. The option included upgrading the signal lights to have a protected/permissive left turn phase. The analysis showed that this option would result in some intersection improvements but could not achieve LOS C or better for the overall intersection operation. It should be noted that LOS C is WVDOH's design year level of service criteria threshold for intersection improvements. The overall intersection would operate at an unacceptable level of service (LOS E). In addition, the left turn lane option would result in the eastbound Greenbag Road traffic queue to extend past the Bluegrass Village Driveway. In regards to safety, a conventional 4-way intersection has 32 points of vehicle conflict due to vehicular maneuvers through the intersection. A roundabout has 8 points of vehicle conflict, which all occur in the same direction, reducing crash severity and likelihood of injury. Studies by the Federal Highway Administration (FHWA) have shown that roundabouts typically achieve reduction in overall collisions, injury collisions, fatality collisions, and pedestrian collisions. Reasons for these reductions due to the installation of a roundabout include: - Low travel speeds – Drivers must slow down and yield to traffic before entering a roundabout. The reduction in speeds results in a decrease in crash severity and injury. - No traffic light "to beat" – The design of a roundabout promotes a continuous circular flow of traffic. Because of this design, drivers will not have the incentive to speed up to "beat the light", like they may at a traditional intersection. - One way travel – The design of a roundabout directs drivers through gently designed curves into a one-way counterclockwise circular path. This design eliminates the possibilities for T-bone and head-on collisions. Road repair beyond the scope of this project is being addressed through the Governor's Roads to Prosperity program and progress can be tracked via the WVDOH website. The traffic control plan, which will outline the intended traffic detour tour, will continue to be revised during final design. It should be noted that Aaron's Creek Road will not be utilized as a signed detour. The anticipated plan intends to utilize the center of the Dorsey Avenue /Kingwood Pike roundabout as a temporary intersection with temporary traffic signals during construction. A short-term detour is proposed using Summers School Road while constructing the connection of the existing Kingwood Pike with the new portion.

	The traffic control plan, which will outline the intended traffic detour tour, will continue to be revised during final design. It should be noted that Aaron's Creek Road will not be utilized as a signed detour. The anticipated plan intends to utilize the center of the Dorsey Avenue /Kingwood Pike roundabout as a temporary intersection with temporary traffic signals during construction. A short-term detour is proposed using Summers School Road while constructing the connection of the existing Kingwood Pike with the new portion. The turn lane options that were examined do not improve the level of service as much as the roundabout at the intersection of Dorsey Avenue/Kingwood Pike. In addition, the turn lane option involves complete takes of 2 residences and 1 business. This change will be noted in the FONSI. Adding only left turn lanes on Greenbag Road at the Dorsey/Kingwood Pike intersection was evaluated during an initial round of traffic analysis because this option had been suggested by the MPO. The option included upgrading the signal lights to have a protected/permissive left turn phase. It should be noted that LOS C is WVDOH's design year level of service criteria threshold for intersection improvements. The overall intersection would operate at an unacceptable level of service (LOS E). In addition, the left turn lane option would result in the eastbound Greenbag Road traffic queue to extend past the Bluegrass Village Driveway. The EA reported impacts to Federal Farmland Protection Policy Act (FPPA) soils. The entire Greenbag Road environmental study area is encompassed by "land already in or committed to urban development" as defined by the FPPA (see 7 CFR § 658.2 - Definitions) and is therefore not subject to provisions of FPPA. Please refer to the Farmland Appendix attached to the FONSI for further detail.
469	Conscious Harvest Cooperative Community Garden, Joy and Hemp Universal LLC, and Mockingbird Hill Farms are located on private property and the property owner will be compensated for the sale of any land to the WVDOH during the right-of-way acquisition process. Impacts to this parcel have been minimized to the extent practicable. Approximately 1.56 acres (67,900 square feet) will be required from the parcel. Fair market value will be paid for all properties that require full or partial acquisition as a result of the project. When only part of the property is required, as is the case with this parcel, fair market value of the part taken will be paid, plus damages, if any, to the residue, less all benefits. West Virginia law defines "market value" as the price a willing buyer would pay a willing seller, neither acting under compulsion nor duress, both exercising prudence and intelligent judgment as to its value and familiar with the purpose for which the property is reasonably available. Fair market value will be determined by a competent, professional real estate appraiser after a thorough inspection of the property, a comparison with similar properties in the area that have been sold recently, a determination and consideration of its replacement cost and depreciation and consideration of the income-producing potential. All appraisal reports are office-reviewed, then rechecked in the field by experienced, qualified review appraisers for accuracy. Since the Division of Highways has adopted a firm price policy, the property owner will be offered the full amount of the approved appraisal. There will be no attempt to buy property at less than fair market value. This policy guarantees that all citizens of the state receive full value for the money expended for highway rights of way. Those who hold a valid property interest in the property that is acquired for the project will be compensated during the ROW acquisition phase. In regards to safety, a conventional 4-way intersection has 32 points of vehicle conflict due to vehicular maneuvers through the intersection. A roundabout has 8 points of vehicle conflict, which all occur in the same direction, reducing crash severity and likelihood of injury. Studies by the

	Federal Highway Administration (FHWA) have shown that roundabouts typically achieve reduction in overall collisions, injury collisions, fatality collisions, and pedestrian collisions. Reasons for these reductions due to the installation of a roundabout include: - Low travel speeds – Drivers must slow down and yield to traffic before entering a roundabout. The reduction in speeds results in a decrease in crash severity and injury. - No traffic light "to beat" – The design of a roundabout promotes a continuous circular flow of traffic. Because of this design, drivers will not have the incentive to speed up to "beat the light", like they may at a traditional intersection. - One way travel – The design of a roundabout directs drivers through gently designed curves into a one-way counterclockwise circular path. This design eliminates the possibilities for T-bone and head-on collisions. Road repair beyond the scope of this project is being addressed through the Governor's Roads to Prosperity program and progress can be tracked via the WVDOH website.
470	The MMMPO had completed several previous studies evaluating various transportation plans for the Greenbag Road corridor, with the ultimate vision of transforming Greenbag Road into a safe, efficient, and attractive multimodal transportation facility. The scenarios determined to be evaluated in the traffic study evolved from the outcome of the MMMPO's preliminary studies and findings. Existing two-way stop controlled operations with potential roadway improvements were evaluated as part of the traffic study, as well as traffic signal and roundabout options. The preliminary investigation and engineering traffic study has examined two build alternatives and three options for each of the major intersections. The intersection options that were evaluated and analyzed include turning lanes, traffic signals, and roundabouts. WVDOH requires intersection improvements to meet or exceed an overall intersection LOS C or better during the peak hours studied for design year improvements. The times of day (peak hours) selected to be studied followed WVDOH guidelines and is standard traffic engineering practice for determining future intersection improvements. At the intersection of Greenbag Road/Dorsey Avenue/Kingwood Pike the traffic analysis determined that the intersection would operate at failure (overall intersection LOS F) if existing intersection conditions and operations were to remain the same 30-years in the future (design year) without any improvements. Adding only left turn lanes on Greenbag Road at the Dorsey/Kingwood Pike intersection was evaluated during an initial round of traffic analysis because this option had been suggested by the MPO. The option included upgrading the signal lights to have a protected/permissive left turn phase. The analysis showed that this option would result in some intersection improvements but could not achieve LOS C or better for the overall intersection operation. The overall intersection would operate at an unacceptable LOS (LOS E). In addition, the left turn lane option would result in the eastbound Greenbag Road traffic queue to extend past the Bluegrass Village Driveway. The traffic analysis determined that with installation of a roundabout the overall intersection would operate at a LOS C, meeting WVDOH design year criteria. The EA reported impacts to Federal Farmland Protection Policy Act (FPPA) soils. The entire Greenbag Road environmental study area is encompassed by "land already in or committed to urban development" as defined by the FPPA (see 7 CFR § 658.2 - Definitions) and is therefore not subject to provisions of FPPA. Please refer to the Farmland Appendix attached to the FONSI for further detail.

	Conscious Harvest Cooperative Community Garden, Joy and Hemp Universal LLC, and Mockingbird Hill Farms are located on private property and the property owner will be compensated for the sale of any land to the WVDOH during the right-of-way acquisition process. Impacts to this parcel have been minimized to the extent practicable. Approximately 1.56 acres (67,900 square feet) will be required from the parcel. Fair market value will be paid for all properties that require full or partial acquisition as a result of the project. When only part of the property is required, as is the case with this parcel, fair market value of the part taken will be paid, plus damages, if any, to the residue, less all benefits. Those who hold a valid property interest in the property that is acquired for the project will be compensated during the ROW acquisition phase. The traffic control plan will continue to be revised during final design, and will not use Aaron's Creek Road as a signed detour. The revised plan intends to utilize the center of the Dorsey/Kingwood roundabout as a temporary intersection with temporary traffic signals. A short-term detour is proposed using Summers School Road while constructing the connection of the existing Kingwood Pike with the new portion. Coordination with emergency services will occur during the finalization of the traffic control plan in final design.
471	We appreciate your input regarding the project.
472	We appreciate your input regarding the project.
473	The cultural resources surveys were conducted according to the guidelines published by the WV State Historic Preservation Office. The archaeological survey included the excavation of 213 shovel test pits, one test excavation unit, and visual inspection of the entire surface area within the defined area of potential effect. Based on the SHPO guidelines, when no cultural resources are identified during the Phase I survey, an abbreviated technical report is acceptable. As the reviewing agency, the WV SHPO concurred with the recommendation that no further archaeological investigations were warranted and no archaeological historic properties are present in the study area. The historic structures survey resulted in the identification of 25 structures 45+ years old within the defined area of potential effect. Two of the resources were recommended eligible for the National Register of Historic Places and the project was designed to avoid potential impacts to these properties. As the reviewing agency, the WV SHPO concurred with the recommendation that the project would not adversely affect any NRHP eligible resources and that no further historic structures investigations were needed. More information is available in the EA appendices. The EA and appendices are available on the WVDOH website: https://transportation.wv.gov/highways/engineering/comment/closed/greenbagroadimprovementproject/Pages/default.aspx.

474	The preliminary investigation and engineering traffic study was completed to evaluate the Greenbag Road corridor, evaluating the existing and potential future operation of the intersections selected for study by WVDOH. The evaluation of existing roadway conditions, including the existing roadway conditions of Kingwood Pike, was not part of the preliminary investigation and engineering traffic study. The Greenbag Road corridor has long been recognized as a challenging roadway to navigate due to geometric deficiencies, significant intersection delays during the peak hours, and increased volume of truck traffic and development within the corridor. Several studies have been previously completed through the MMMPO, evaluating various transportation plans for the Greenbag Road corridor, with the ultimate vision of transforming Greenbag Road into a safe, efficient, and attractive multimodal transportation facility. It should be noted that the traffic evaluation was completed prior to the COVID-19 pandemic and its effects to traffic currently occurring. The EA reviewed multiple alternatives including turn lanes, traffic lights, and the roundabouts. Through the analysis in the EA, the only alternative that meets the purpose and need of the project is the roundabout. The EA reported impacts to Federal Farmland Protection Policy Act (FPPA) soils. The entire Greenbag Road environmental study area is encompassed by "land already in or committed to urban development" as defined by the FPPA (see 7 CFR § 658.2 - Definitions) and is therefore not subject to provisions of FPPA. Please refer to the Farmland Appendix attached to the FONSI for further detail. Conscious Harvest Cooperative Community Garden, Joy and Hemp Universal LLC, and Mockingbird Hill Farms are located on private property and the property owner will be compensated for the sale of any land to the WVDOH during the right-of-way acquisition process. Impacts to this parcel have been minimized to the extent practicable. Approximately 1.56 acres (67,900 square feet) will be required from the parcel. Fair market value will be paid for all properties that require full or partial acquisition as a result of the project. When only part of the property is required, as is the case with this parcel, fair market value of the part taken will be paid, plus damages, if any, to the residue, less all benefits. West Virginia law defines "market value" as the price a willing buyer would pay a willing seller, neither acting under compulsion nor duress, both exercising prudence and intelligent judgment as to its value and familiar with the purpose for which the property is reasonably available. Fair market value will be determined by a competent, professional real estate appraiser after a thorough inspection of the property, a comparison with similar properties in the area that have been sold recently, a determination and consideration of its replacement cost and depreciation and consideration of the income-producing potential. All appraisal reports are office-reviewed, then rechecked in the field by experienced, qualified review appraisers for accuracy. Since the Division of Highways has adopted a firm price policy, the property owner will be offered the full amount of the approved appraisal. There will be no attempt to buy property at less than fair market value. This policy guarantees that all citizens of the state receive full value for the money expended for highway rights of way. Those who hold a valid property interest in the property that is acquired for the project will be compensated during the ROW acquisition phase.
475	Road repair beyond the scope of this project is being addressed through the Governor's Roads to Prosperity program and progress can be tracked via the WVDOH website. Both the MMMPO corridor study and the 2018 traffic study determined that traffic flow through the corridor is controlled by the congestion at the major intersections in the corridor. The projected growth in the Morgantown area will continue to increase traffic and congestion at the intersections if improvements do not occur.

	Roundabouts help reduce the likelihood and severity of collisions. Studies by the Federal Highway Administration (FHWA) have shown that roundabouts typically achieve reduction in overall collisions, injury collisions, fatality collisions, and pedestrian collisions. Reasons for these reductions due to the installation of a roundabout include: Low travel speeds – Drivers must slow down and yield to traffic before entering a roundabout. The reduction in speeds results in a decrease in crash severity and injury. No traffic light "to beat" – The design of a roundabout promotes a continuous circular flow of traffic. Because of this design, drivers will not have the incentive to speed up to "beat the light", like they may at a traditional intersection. One way travel – The design of a roundabout directs drivers through gently designed curves into a one-way counterclockwise circular path. This design eliminates the possibilities for T-bone and head-on collisions. In addition, a conventional 4-way intersection has 32 points of vehicle conflict due to the different maneuvers through the intersection. A roundabout has 8 points of conflict, which all occur in the same direction, reducing crash severity and likelihood of injury.
476	The preliminary investigation and engineering traffic study was completed to evaluate the Greenbag Road corridor, evaluating the existing and potential future operation of the intersections selected for study by WVDOH. The Greenbag Road corridor has long been recognized as a challenging roadway to navigate due to geometric deficiencies, significant intersection delays during the peak hours, and increased volume of truck traffic and development within the corridor. Several studies have been previously completed through the MMMPO, evaluating various transportation plans for the Greenbag Road corridor, with the ultimate vision of transforming Greenbag Road into a safe, efficient, and attractive multimodal transportation facility. It should be noted that the traffic evaluation was completed prior to the COVID-19 pandemic and its effects to traffic currently occurring. The EA reviewed multiple alternatives including turn lanes, traffic lights, and the roundabouts. Through the analysis in the EA, the only alternative that meets the purpose and need of the project is the roundabout. One of the major differences between Greenbag Road and the Mileground, is the volume of traffic. Greenbag Road has less than half the traffic volume that Mileground has. A second major difference is the general configuration of the roundabouts. The proposed roundabouts on Greenbag are more straightforward and more traditional roundabout designs, without all of the confusing lanes that are present at Mileground. The roundabouts on Greenbag Road will be more intuitive for drivers.
477	The diversion of traffic from downtown, including large trucks, is not within the scope of this project. Road repair beyond the scope of this project is being addressed through the Governor's Roads to Prosperity program and progress can be tracked via the WVDOH website.
478	The preliminary investigation and engineering traffic study was completed to evaluate the Greenbag Road corridor, evaluating the existing and potential future operation of the intersections selected for study by WVDOH. The Greenbag Road corridor has long been recognized as a challenging roadway to navigate due to geometric deficiencies, significant intersection delays during the peak hours, and increased volume of truck traffic and development within the corridor. Several studies have been previously completed through the MMMPO, evaluating various transportation plans for the Greenbag Road corridor, with the ultimate vision of transforming Greenbag Road into a safe, efficient, and attractive

	multimodal transportation facility. It should be noted that the traffic evaluation was completed prior to the COVID-19 pandemic and its effects to traffic currently occurring. Conscious Harvest Cooperative Community Garden, Joy and Hemp Universal LLC, and Mockingbird Hill Farms are located on private property and the property owner will be compensated for the sale of any land to the WVDOH during the right-of-way acquisition process. Impacts to this parcel have been minimized to the extent practicable. Approximately 1.56 acres (67,900 square feet) will be required from the parcel. Fair market value will be paid for all properties that require full or partial acquisition as a result of the project. When only part of the property is required, as is the case with this parcel, fair market value of the part taken will be paid, plus damages, if any, to the residue, less all benefits. West Virginia law defines "market value" as the price a willing buyer would pay a willing seller, neither acting under compulsion nor duress, both exercising prudence and intelligent judgment as to its value and familiar with the purpose for which the property is reasonably available. Fair market value will be determined by a competent, professional real estate appraiser after a thorough inspection of the property, a comparison with similar properties in the area that have been sold recently, a determination and consideration of its replacement cost and depreciation and consideration of the income-producing potential. All appraisal reports are office-reviewed, then rechecked in the field by experienced, qualified review appraisers for accuracy. Since the Division of Highways has adopted a firm price policy, the property owner will be offered the full amount of the approved appraisal. There will be no attempt to buy property at less than fair market value. This policy guarantees that all citizens of the state receive full value for the money expended for highway rights of way. Those who hold a valid property interest in the property that is acquired for the project will be compensated during the ROW acquisition phase. The diversion of traffic from downtown, including large trucks, is not within the scope of this project.
479	The preliminary investigation and engineering traffic study has examined two build alternatives and three options for each of the major intersections. The intersection options that were evaluated and analyzed include turning lanes, traffic signals, and roundabouts. WVDOH requires intersection improvements to meet or exceed an overall intersection LOS C or better during the peak hours studied for design year improvements. The times of day (peak hours) selected to be studied followed WVDOH guidelines and is standard traffic engineering practice for determining future intersection improvements. At the intersection of Greenbag Road/Dorsey Avenue/Kingwood Pike the traffic analysis determined that the intersection would operate at failure (overall intersection LOS F) if existing intersection conditions and operations were to remain the same 30-years in the future (design year) without any improvements. Adding only left turn lanes on Greenbag Road at the Dorsey/Kingwood Pike intersection was evaluated during an initial round of traffic analysis because this option had been suggested by the MPO. The option included upgrading the signal lights to have a protected/permissive left turn phase. The analysis showed that this option would result in some intersection improvements but could not achieve LOS C or better for the overall intersection operation. The overall intersection would operate at an unacceptable LOS (LOS E). In addition, the left turn lane option would result in the eastbound Greenbag Road traffic queue to extend past the Bluegrass Village Driveway. The traffic analysis determined that with installation of a roundabout the overall intersection would operate at a LOS C, meeting WVDOH design year criteria.

	The roundabouts have been designed with larger vehicles in mind and incorporate truck aprons to support the weight and turning radius of larger vehicles, including school buses. In addition, roundabouts help reduce the likelihood and severity of collisions. Studies by the Federal Highway Administration (FHWA) have shown that roundabouts typically achieve reduction in overall collisions, injury collisions, fatality collisions, and pedestrian collisions. Reasons for these reductions due to the installation of a roundabout include: - Low travel speeds – Drivers must slow down and yield to traffic before entering a roundabout. The reduction in speeds results in a decrease in crash severity and injury. - No traffic light "to beat" – The design of a roundabout promotes a continuous circular flow of traffic. Because of this design, drivers will not have the incentive to speed up to "beat the light", like they may at a traditional intersection. - One way travel – The design of a roundabout directs drivers through gently designed curves into a one-way counterclockwise circular path. This design eliminates the possibilities for T-bone and head-on collisions. In addition, a conventional 4-way intersection has 32 points of vehicle conflict due to the different crossings and maneuvers through the intersection. A roundabout has 8 points of conflict, which all occur in the same direction, reducing crash severity and likelihood of injury. Lastly, long-term costs associated with roundabouts are significantly less than a traffic signal, since no electrical costs and no traffic signal maintenance costs are involved with a roundabout. The intersection of Greenbag Road/Dorsey Avenue/Kingwood Pike is currently controlled by a traffic signal and not by a four-way (all-way) stop, which includes stop sign control on each approach. The intersection would operate at failure (overall intersection LOS F) if existing intersection conditions and operations (traffic signal control) were to remain the same 30-years in the future (design year) without any improvements. Therefore, traffic analysis was not completed for a four-way (all-way) stop controlled intersection operations. Conscious Harvest Cooperative Community Garden, Joy and Hemp Universal LLC, and Mockingbird Hill Farms are located on private property and the property owner will be compensated for the sale of any land to the WVDOH during the right-of-way acquisition process. Impacts to this parcel have been minimized to the extent practicable. Approximately 1.56 acres (67,900 square feet) will be required from the parcel. Fair market value will be paid for all properties that require full or partial acquisition as a result of the project. When only part of the property is required, as is the case with this parcel, fair market value of the part taken will be paid, plus damages, if any, to the residue, less all benefits. West Virginia law defines "market value" as the price a willing buyer would pay a willing seller, neither acting under compulsion nor duress, both exercising prudence and intelligent judgment as to its value and familiar with the purpose for which the property is reasonably available. Fair market value will be determined by a competent, professional real estate appraiser after a thorough inspection of the property, a comparison with similar properties in the area that have been sold recently, a determination and consideration of its replacement cost and depreciation and consideration of the income-producing potential. All appraisal reports are office-reviewed, then rechecked in the field by experienced, qualified review appraisers for accuracy. Since the Division of Highways has adopted a firm price policy, the property owner will be offered the full amount of the approved appraisal. There will be no attempt to buy property at less than fair market value. This policy guarantees that all citizens of the state receive full value for the money expended for highway rights of way.

	Those who hold a valid property interest in the property that is acquired for the project will be compensated during the ROW acquisition phase.
480	A shared-use path was part of some early versions of the project, but the right of way impacts along Bluegrass Village and the Kennedy Center were significant. Due to these detrimental impacts the shared use path was removed from the alternatives that were advanced to the EA. The sidewalk design has been extended from the western end of the project area along Greenbag Road to the Dorsey Avenue/Kingwood Pike intersection. At the intersection the sidewalk follows Dorsey Avenue north to Luckey Lane and east on Luckey Lane to the connection with the existing sidewalk at Mountainview Elementary School. The shoulder along the north side of Greenbag Road is being designed to accommodate bicycle use by being wider (3 feet) than the standard shoulder (2 feet). Extensions beyond the scope of this project can be considered during future planning. Thank you for enumerating the safety concerns and the proposed HAWK beacon crosswalk.
481	The EA reviewed multiple alternatives including turn lanes, traffic lights, and the roundabouts. Through the analysis in the EA, the only alternative that meets the purpose and need of the project is the roundabout. Road repair beyond the scope of this project is being addressed through the Governor's Roads to Prosperity program and progress can be tracked via the WVDOH website. The traffic control plan, which will outline the intended traffic detour tour, will continue to be revised during final design. It should be noted that Aaron's Creek Road will not be utilized as a signed detour. The anticipated plan intends to utilize the center of the Dorsey Avenue /Kingwood Pike roundabout as a temporary intersection with temporary traffic signals during construction. A short-term detour is proposed using Summers School Road while constructing the connection of the existing Kingwood Pike with the new portion.
482	The preliminary investigation and engineering traffic study was completed to evaluate the Greenbag Road corridor, evaluating the existing and potential future operation of the intersections selected for study by WVDOH. The Greenbag Road corridor has long been recognized as a challenging roadway to navigate due to geometric deficiencies, significant intersection delays during the peak hours, and increased volume of truck traffic and development within the corridor. Several studies have been previously completed through the MMMPO, evaluating various transportation plans for the Greenbag Road corridor, with the ultimate vision of transforming Greenbag Road into a safe, efficient, and attractive multimodal transportation facility. It should be noted that the traffic evaluation was completed prior to the COVID-19 pandemic and its effects to traffic currently occurring. Roundabouts are designed to maintain a constant flow of traffic through the intersection which results in reduced congestion on roadways and a reduction in delays for drivers. One of the major differences between Greenbag Road and the Mileground, is the volume of traffic. Greenbag Road has less than half the traffic volume that Mileground has. A second major difference is the general configuration of the roundabouts. The proposed roundabouts on Greenbag are more straightforward and more traditional roundabout designs, without all of the confusing lanes that are present at Mileground. The roundabouts on Greenbag Road will be more intuitive for drivers.

	The traffic control plan, which will outline the intended traffic detour tour, will continue to be revised during final design. It should be noted that Aaron's Creek Road will not be utilized as a signed detour. The anticipated plan intends to utilize the center of the Dorsey Avenue /Kingwood Pike roundabout as a temporary intersection with temporary traffic signals during construction. A short-term detour is proposed using Summers School Road while constructing the connection of the existing Kingwood Pike with the new portion.
483	Changes to the interstate access in Morgantown are beyond the scope of the current project. Roundabouts are designed to slow speeds in the approach and through the roundabout allowing drivers more response time and limiting the number of potential directions where traffic could approach. Both of these factors improve safety for all drivers, including older drivers as well as pedestrians, and cyclists. Signage meeting WVDOH and the Federal Manual on Uniform Traffic Control Devices will be placed to assist drivers with navigating the roundabouts. The roundabouts have been designed with larger vehicles in mind and incorporate truck aprons to support the weight and turning radius of larger vehicles, including school buses. In addition, roundabouts help reduce the likelihood and severity of collisions. Studies by the Federal Highway Administration (FHWA) have shown that roundabouts typically achieve reduction in overall collisions, injury collisions, fatality collisions, and pedestrian collisions. Reasons for these reductions due to the installation of a roundabout include: - Low travel speeds – Drivers must slow down and yield to traffic before entering a roundabout. The reduction in speeds results in a decrease in crash severity and injury. - No traffic light "to beat" – The design of a roundabout promotes a continuous circular flow of traffic. Because of this design, drivers will not have the incentive to speed up to "beat the light", like they may at a traditional intersection. - One way travel – The design of a roundabout directs drivers through gently designed curves into a one-way counterclockwise circular path. This design eliminates the possibilities for T-bone and head-on collisions. In addition, a conventional 4-way intersection has 32 points of vehicle conflict due to the different crossings and maneuvers through the intersection. A roundabout has 8 points of conflict, which all occur in the same direction, reducing crash severity and likelihood of injury. Lastly, long-term costs associated with roundabouts are significantly less than a traffic signal, since no electrical costs and no traffic signal maintenance costs are involved with a roundabout.
484	Thank you for enumerating the safety concerns and the crosswalk locations. The WVDOH will examine all safety concerns as part of the final design.
485	Thank you for enumerating the safety concerns and the crosswalk locations. The WVDOH will examine all safety concerns as part of the final design. The need for a sidewalk was identified by the public in the comments for the MMMPO corridor study as one of the factors to improve safety in the Greenbag Road corridor. Pedestrians should use the dedicated crosswalks when safely crossing, just like crossing any other intersection. At a roundabout, pedestrian crosswalks will be placed to cross each roadway leg to the roundabout, which is the same as

	traditional intersection crossings. The roundabout pedestrian crosswalk placement allows pedestrians to cross one direction of traffic a time at each roundabout approach because of the splitter island.
486	Thank you for enumerating the safety concerns and the crosswalk locations. The WVDOH will examine all safety concerns as part of the final design. A shared-use path was part of some early versions of the project, but the right of way impacts along Bluegrass Village and the Kennedy Center were significant. Due to these detrimental impacts the shared use path was removed from the alternatives that were advanced to the EA. Moving the intersection to the north into the former Atomic Grill location is not feasible given the topography and approach angles.
487	Thank you for enumerating the safety concerns and the crosswalk locations. The WVDOH will examine all safety concerns as part of the final design.
488	The preliminary investigation and engineering traffic study has examined two build alternatives and three options for each of the major intersections. The intersection options that were evaluated and analyzed include turning lanes, traffic signals, and roundabouts. WVDOH requires intersection improvements to meet or exceed an overall intersection LOS C or better during the peak hours studied for design year improvements. The times of day (peak hours) selected to be studied followed WVDOH guidelines and is standard traffic engineering practice for determining future intersection improvements. At the intersection of Greenbag Road/Dorsey Avenue/Kingwood Pike the traffic analysis determined that the intersection would operate at failure (overall intersection LOS F) if existing intersection conditions and operations were to remain the same 30-years in the future (design year) without any improvements. Adding only left turn lanes on Greenbag Road at the Dorsey/Kingwood Pike intersection was evaluated during an initial round of traffic analysis because this option had been suggested by the MPO. The option included upgrading the signal lights to have a protected/permissive left turn phase. The analysis showed that this option would result in some intersection improvements but could not achieve LOS C or better for the overall intersection operation. The overall intersection would operate at an unacceptable LOS (LOS E). In addition, the left turn lane option would result in the eastbound Greenbag Road traffic queue to extend past the Bluegrass Village Driveway. The traffic analysis determined that with installation of a roundabout the overall intersection would operate at a LOS C, meeting WVDOH design year criteria. The traffic control plan, which will outline the intended traffic detour tour, will continue to be revised during final design. It should be noted that Aaron's Creek Road will not be utilized as a signed detour. The anticipated plan intends to utilize the center of the Dorsey Avenue /Kingwood Pike roundabout as a temporary intersection with temporary traffic signals during construction. A short-term detour is proposed using Summers School Road while constructing the connection of the existing Kingwood Pike with the new portion.
489	The preliminary investigation and engineering traffic study has examined two build alternatives and three options for each of the major intersections. The intersection options that were evaluated and analyzed include turning lanes, traffic signals, and roundabouts. WVDOH requires intersection improvements to meet or exceed an overall intersection LOS C or better during the peak hours studied for design year improvements. The times of day (peak hours) selected to be studied followed WVDOH guidelines and is standard traffic engineering practice for determining future intersection improvements.

	At the intersection of Greenbag Road/Dorsey Avenue/Kingwood Pike the traffic analysis determined that the intersection would operate at failure (overall intersection LOS F) if existing intersection conditions and operations were to remain the same 30-years in the future (design year) without any improvements. Adding only left turn lanes on Greenbag Road at the Dorsey/Kingwood Pike intersection was evaluated during an initial round of traffic analysis because this option had been suggested by the MPO. The option included upgrading the signal lights to have a protected/permissive left turn phase. The analysis showed that this option would result in some intersection improvements but could not achieve LOS C or better for the overall intersection operation. The overall intersection would operate at an unacceptable LOS (LOS E). In addition, the left turn lane option would result in the eastbound Greenbag Road traffic queue to extend past the Bluegrass Village Driveway. The traffic analysis determined that with installation of a roundabout the overall intersection would operate at a LOS C, meeting WVDOH design year criteria. Changes to the interstate are outside the scope of the current project. The traffic control plan, which will outline the intended traffic detour tour, will continue to be revised during final design. It should be noted that Aaron's Creek Road will not be utilized as a signed detour. The anticipated plan intends to utilize the center of the Dorsey Avenue /Kingwood Pike roundabout as a temporary intersection with temporary traffic signals during construction. A short-term detour is proposed using Summers School Road while constructing the connection of the existing Kingwood Pike with the new portion.
490	The traffic control plan, which will outline the intended traffic detour tour, will continue to be revised during final design. It should be noted that Aaron's Creek Road will not be utilized as a signed detour. The anticipated plan intends to utilize the center of the Dorsey Avenue /Kingwood Pike roundabout as a temporary intersection with temporary traffic signals during construction. A short-term detour is proposed using Summers School Road while constructing the connection of the existing Kingwood Pike with the new portion.
491	The traffic control plan, which will outline the intended traffic detour tour, will continue to be revised during final design. It should be noted that Aaron's Creek Road will not be utilized as a signed detour. The anticipated plan intends to utilize the center of the Dorsey Avenue /Kingwood Pike roundabout as a temporary intersection with temporary traffic signals during construction. A short-term detour is proposed using Summers School Road while constructing the connection of the existing Kingwood Pike with the new portion.
492	The preliminary investigation and engineering traffic study was completed to evaluate the Greenbag Road corridor, evaluating the existing and potential future operation of the intersections selected for study by WVDOH. The Greenbag Road corridor has long been recognized as a challenging roadway to navigate due to geometric deficiencies, significant intersection delays during the peak hours, and increased volume of truck traffic and development within the corridor. Several studies have been previously completed through the MMMPO, evaluating various transportation plans for the Greenbag Road corridor, with the ultimate vision of transforming Greenbag Road into a safe, efficient, and attractive multimodal transportation facility. It should be noted that the traffic evaluation was completed prior to the COVID-19 pandemic and its effects to traffic currently occurring. The EA reviewed multiple alternatives including turn lanes, traffic lights, and the roundabouts. Through the analysis in the EA, the only alternative that meets the purpose and need of the project is the roundabout.

	Conscious Harvest Cooperative Community Garden, Joy and Hemp Universal LLC, and Mockingbird Hill Farms are located on private property and the property owner will be compensated for the sale of any land to the WVDOH during the right-of-way acquisition process. Impacts to this parcel have been minimized to the extent practicable. Approximately 1.56 acres (67,900 square feet) will be required from the parcel. Fair market value will be paid for all properties that require full or partial acquisition as a result of the project. When only part of the property is required, as is the case with this parcel, fair market value of the part taken will be paid, plus damages, if any, to the residue, less all benefits. West Virginia law defines “market value” as the price a willing buyer would pay a willing seller, neither acting under compulsion nor duress, both exercising prudence and intelligent judgment as to its value and familiar with the purpose for which the property is reasonably available. Fair market value will be determined by a competent, professional real estate appraiser after a thorough inspection of the property, a comparison with similar properties in the area that have been sold recently, a determination and consideration of its replacement cost and depreciation and consideration of the income-producing potential. All appraisal reports are office-reviewed, then rechecked in the field by experienced, qualified review appraisers for accuracy. Since the Division of Highways has adopted a firm price policy, the property owner will be offered the full amount of the approved appraisal. There will be no attempt to buy property at less than fair market value. This policy guarantees that all citizens of the state receive full value for the money expended for highway rights of way. Those who hold a valid property interest in the property that is acquired for the project will be compensated during the ROW acquisition phase. Sidewalks are included in both of the build alternatives considered. Road repair beyond the scope of this project is being addressed through the Governor's Roads to Prosperity program and progress can be tracked via the WVDOH website.
493	The preliminary investigation and engineering traffic study was completed to evaluate the Greenbag Road corridor, evaluating the existing and potential future operation of the intersections selected for study by WVDOH. The Greenbag Road corridor has long been recognized as a challenging roadway to navigate due to geometric deficiencies, significant intersection delays during the peak hours, and increased volume of truck traffic and development within the corridor. Several studies have been previously completed through the MMMPO, evaluating various transportation plans for the Greenbag Road corridor, with the ultimate vision of transforming Greenbag Road into a safe, efficient, and attractive multimodal transportation facility. 494	The roundabouts were designed to accommodate AASHTO WB-62 truck configuration, which is an interstate semi-truck with a 62' wheel base between steer axle and last trailer axle, including a 48' trailer. Larger trucks can navigate the roundabout and use the internal truck apron.
495	The MMMPO had completed several previous studies evaluating various transportation plans for the Greenbag Road corridor, with the ultimate vision of transforming Greenbag Road into a safe, efficient, and attractive multimodal transportation facility. The scenarios determined to be evaluated in the traffic study evolved from the outcome of the MMMPO's preliminary studies and findings. Existing two-way stop controlled operations with potential roadway improvements were evaluated as part of the traffic, as well as traffic signal and roundabout options. The intersection of Greenbag Road/Dorsey Avenue/Kingwood Pike is currently controlled by a traffic signal and not by a four-way (all-way) stop, which includes stop sign control on each approach. The intersection would operate at failure (overall intersection LOS F) if existing intersection conditions and operations (traffic signal control) were to remain the same 30-years in the future (design year) without any improvements. Therefore, traffic analysis was not completed for a four-way (all-way) stop controlled intersection operations. The turn lane options that were examined do not improve the level of service as much as the roundabout at the intersection of Dorsey Avenue/Kingwood Pike. In addition, the turn lane option involves complete takes of 2 residences and 1 business. This change will be noted in the FONSI. Adding only left turn lanes on Greenbag Road at the Dorsey/Kingwood Pike intersection was evaluated during an initial round of traffic analysis because this option had been suggested by the MPO. The option included upgrading the signal lights to have a protected/permissive left turn phase. The analysis showed that this option would result in some intersection improvements but could not achieve LOS C or better for the overall intersection operation. It should be noted that LOS C is WVDOH's design year level of service criteria threshold for intersection improvements. The overall intersection would operate at an unacceptable level of service (LOS E). In addition, the left turn lane option would result in the eastbound Greenbag Road traffic queue to extend past the Bluegrass Village Driveway.
496	Both the MMMPO corridor study and the 2018 traffic study determined that traffic flow through the corridor is controlled by the congestion at the major intersections in the corridor. The projected growth in the Morgantown area will continue to increase traffic and congestion at the

	intersections if improvements do not occur. Roundabouts are designed to maintain a constant flow of traffic through the intersection which results in reduced congestion on roadways and a reduction in delays for drivers. Road repair beyond the scope of this project is being addressed through the Governor's Roads to Prosperity program and progress can be tracked via the WVDOH website.
497	Road repair beyond the scope of this project is being addressed through the Governor's Roads to Prosperity program and progress can be tracked via the WVDOH website.
498	Road repair beyond the scope of this project is being addressed through the Governor's Roads to Prosperity program and progress can be tracked via the WVDOH website.
499	The existing grade on Kingwood Pike requires stopping on a -6.5% grade at the traffic signal. The grade approaching the roundabout includes a flat grade of less than 2% at the roundabout. In most cases, the roundabout will not require approaching traffic to come to a full or immediate stop, and does not queue traffic on the steep grade as the existing traffic signal does.
500	Any property needed for the project will be acquired under the Uniform Relocation Assistance and Real Property Acquisition Act (1970) through negotiations with the landowners.
501	All comments received by the WVDOH have been included and considered during the analysis and development of the project. The public comment period extended from September 29 through November 30, 2020. Comments could be submitted via the online submittal system, emailed or mailed to the WVDOH.
502	The existing grade on Kingwood Pike requires stopping on a -6.5% grade at the traffic signal. The grade approaching the roundabout includes a flat grade of less than 2% at the roundabout. In most cases, the roundabout will not require approaching traffic to come to a full or immediate stop, and does not queue traffic on the steep grade as the existing traffic signal does.
503	This comment is noted.
504	The MMMPO had completed several previous studies evaluating various transportation plans for the Greenbag Road corridor, with the ultimate vision of transforming Greenbag Road into a safe, efficient, and attractive multimodal transportation facility. The scenarios determined to be evaluated in the traffic study evolved from the outcome of the MMMPO's preliminary studies and findings. Existing two-way stop controlled operations with potential roadway improvements were evaluated as part of the traffic, as well as traffic signal and roundabout options. The evaluation and analysis of these intersection options indicate that the roundabout would provide the most improvement to traffic congestion, has the lowest estimated construction cost, and does not displace any residences.

	Road repair beyond the scope of this project is being addressed through the Governor's Roads to Prosperity program and progress can be tracked via the WVDOH website.
505	The turn lane options that were examined do not improve the level of service as much as the roundabout at the intersection of Dorsey Avenue/Kingwood Pike. In addition, the turn lane option involves complete takes of 2 residences and 1 business. These takes are different from what was reported in the EA. This change will be noted in the FONSI. Adding only left turn lanes on Greenbag Road at the Dorsey/Kingwood Pike intersection was evaluated during an initial round of traffic analysis because this option had been suggested by the MPO. The option included upgrading the signal lights to have a protected/permissive left turn phase. The analysis showed that this option would result in some intersection improvements but could not achieve LOS C or better for the overall intersection operation. It should be noted that LOS C is WVDOH's design year level of service criteria threshold for intersection improvements. The overall intersection would operate at an unacceptable level of service (LOS E). In addition, the left turn lane option would result in the eastbound Greenbag Road traffic queue to extend past the Bluegrass Village Driveway. Any property needed for the project will be acquired under the Uniform Relocation Assistance and Real Property Acquisition Act (1970) through negotiations with the landowners.

Therefore, traffic analysis was not completed for a four-way (all-way) stop controlled intersection operations.
510	The traffic control plan, which will outline the intended traffic detour tour, will continue to be revised during final design. It should be noted that Aaron's Creek Road will not be utilized as a signed detour. The anticipated plan intends to utilize the center of the Dorsey Avenue /Kingwood Pike roundabout as a temporary intersection with temporary traffic signals during construction. A short-term detour is proposed using Summers School Road while constructing the connection of the existing Kingwood Pike with the new portion.
511	The MMMPO had completed several previous studies evaluating various transportation plans for the Greenbag Road corridor, with the ultimate vision of transforming Greenbag Road into a safe, efficient, and attractive multimodal transportation facility. The scenarios determined to be evaluated in the traffic study evolved from the outcome of the MMMPO's preliminary studies and findings. Existing two-way stop controlled operations with potential roadway improvements were evaluated as part of the traffic study, as well as traffic signal and roundabout options. The traffic control plan, which will outline the intended traffic detour tour, will continue to be revised during final design. It should be noted that Aaron's Creek Road will not be utilized as a signed detour. The anticipated plan intends to utilize the center of the Dorsey Avenue /Kingwood Pike roundabout as a temporary intersection with temporary traffic signals during construction. A short-term detour is proposed using Summers School Road while constructing the connection of the existing Kingwood Pike with the new portion.
512	The Greenbag Road roundabouts have major differences to other existing roundabouts within Morgantown. The proposed roundabouts on Greenbag are more straightforward and more traditional roundabout designs, without all of the confusing lanes that are present at Mileground. The roundabouts on Greenbag Road will be more intuitive for drivers. Every roundabout is designed and adapted to the context of its location.

	Road repair beyond the scope of this project is being addressed through the Governor's Roads to Prosperity program and progress can be tracked via the WVDOH website. Changes to the interstate access in Morgantown are beyond the scope of the current project.
513	The traffic control plan, which will outline the intended traffic detour tour, will continue to be revised during final design. It should be noted that Aaron's Creek Road will not be utilized as a signed detour. The anticipated plan intends to utilize the center of the Dorsey Avenue /Kingwood Pike roundabout as a temporary intersection with temporary traffic signals during construction. A short-term detour is proposed using Summers School Road while constructing the connection of the existing Kingwood Pike with the new portion. A short-term detour is proposed using Summers School Road while constructing the connection of the existing Kingwood Pike with the new portion.

517	This comment is noted.
518	Road repair beyond the scope of this project is being addressed through the Governor's Roads to Prosperity program and progress can be tracked via the WVDOH website. Both the MMMPO corridor study and the 2018 traffic study determined that traffic flow through the corridor is controlled by the congestion at the major intersections in the corridor. The projected growth in the Morgantown area will continue to increase traffic and congestion at the intersections if improvements do not occur. The EA reviewed multiple alternatives including turn lanes, traffic lights, and the roundabouts. Through the analysis in the EA, the only alternative that meets the purpose and need of the project is the roundabout. Roundabouts are designed to maintain a constant flow of traffic through the intersection which results in reduced congestion on roadways and a reduction in delays for drivers.
519	All comments received by the WVDOH have been included and considered during the analysis and development of the project. The EA reviewed multiple alternatives including turn lanes, traffic lights, and the roundabouts. Through the analysis in the EA, the only alternative that meets the purpose and need of the project is the roundabout. The preliminary investigation and engineering traffic study has examined two build alternatives and three options for each of the major intersections. The intersection options that were evaluated and analyzed include turning lanes, traffic signals, and roundabouts. WVDOH requires intersection improvements to meet or exceed an overall intersection LOS C or better during the peak hours studied for design year improvements. The times of day (peak hours) selected to be studied followed WVDOH guidelines and is standard traffic engineering practice for determining future intersection improvements. At the intersection of Greenbag Road/Dorsey Avenue/Kingwood Pike the traffic analysis determined that the intersection would operate at failure (overall intersection LOS F) if existing intersection conditions and operations were to remain the same 30-years in the future (design year) without any improvements. Adding only left turn lanes on Greenbag Road at the Dorsey/Kingwood Pike intersection was evaluated during an initial round of traffic analysis because this option had been suggested by the MPO. The option included upgrading the signal lights to have a protected/permissive left turn phase. The analysis showed that this option would result in some intersection improvements but could not achieve LOS C or better for the overall intersection operation. The overall intersection would operate at an unacceptable LOS (LOS E). In addition, the left turn lane option would result in the eastbound Greenbag Road traffic queue to extend past the Bluegrass Village Driveway. The traffic analysis determined that with installation of a roundabout the overall intersection would operate at a LOS C, meeting WVDOH design year criteria. At the intersection of Greenbag Road/Mississippi Avenue the traffic analysis determined that the intersection would operate at failure (overall intersection LOS F) if existing intersection conditions and operations were to remain the same 30-years in the future (design year) without any improvements. The design year with improvements scenarios evaluated determined that with installation of a roundabout the overall intersection would operate at a LOS A, best operating conditions, for all peak hours studied. Installation of a traffic signal with turn lanes resulted in an overall intersection LOS B during the AM peak hour, with the Mississippi Avenue approach operating at a LOS C. Though the

	analysis meets WVDOH minimum LOS criteria, the roundabout option exceeds WVDOH minimum LOS criteria. Roundabouts help reduce vehicular delay and promotes a continuous flow of traffic, which increases traffic capacity at an intersection.
520	One of the major differences between Greenbag Road and the Mileground, is the volume of traffic. Greenbag Road has less than half the traffic volume that Mileground has. A second major difference is the general configuration of the roundabouts. The proposed roundabouts on Greenbag are more straightforward and more traditional roundabout designs, without all of the confusing lanes that are present at Mileground. The roundabouts on Greenbag Road will be more intuitive for drivers.
521	The roundabouts have been designed with larger vehicles in mind and incorporate truck aprons to support the weight and turning radius of larger vehicles, including school buses. In addition, roundabouts help reduce the likelihood and severity of collisions. Studies by the Federal Highway Administration (FHWA) have shown that roundabouts typically achieve reduction in overall collisions, injury collisions, fatality collisions, and pedestrian collisions. Reasons for these reductions due to the installation of a roundabout include: - Low travel speeds – Drivers must slow down and yield to traffic before entering a roundabout. The reduction in speeds results in a decrease in crash severity and injury. - No traffic light "to beat" – The design of a roundabout promotes a continuous circular flow of traffic. Because of this design, drivers will not have the incentive to speed up to "beat the light", like they may at a traditional intersection. - One way travel – The design of a roundabout directs drivers through gently designed curves into a one-way counterclockwise circular path. This design eliminates the possibilities for T-bone and head-on collisions. In addition, a conventional 4-way intersection has 32 points of vehicle conflict due to the different crossings and maneuvers through the intersection. A roundabout has 8 points of conflict, which all occur in the same direction, reducing crash severity and likelihood of injury. Lastly, long-term costs associated with roundabouts are significantly less than a traffic signal, since no electrical costs and no traffic signal maintenance costs are involved with a roundabout. The WVDOH has an educational video on how to use a roundabout available for viewing at https://www.youtube.com/watch?v=7njH4MKyo0w.
522	The EA reviewed multiple alternatives including turn lanes, traffic lights, and the roundabouts. Through the analysis in the EA, the only alternative that meets the purpose and need of the project is the roundabout.
523	The preliminary investigation and engineering traffic study has examined two build alternatives and three options for each of the major intersections. The traffic analysis determined that with installation of a roundabout the overall intersection would operate at a LOS C, meeting WVDOH design year criteria. Conscious Harvest Cooperative Community Garden, Joy and Hemp Universal LLC, and Mockingbird Hill Farms are located on private property and the property owner will be compensated for the sale of any land to the WVDOH during the right-of-way acquisition process. Impacts to this parcel have been minimized to the extent practicable. Approximately 1.56 acres (67,900 square feet) will be required from the parcel. Fair market value will be paid for all properties that require full or partial acquisition as a result of the project. When only part of the property is required, as is the case with this parcel, fair market value of the part taken will be paid, plus damages, if any, to the residue, less all benefits. West Virginia law defines “market value” as the price a willing buyer would pay a willing seller, neither acting under compulsion nor duress, both exercising prudence and intelligent judgment as to its value and familiar with the purpose for which the property is reasonably available. Fair market value will be determined by a competent, professional real estate appraiser after a thorough inspection of the property, a comparison with similar properties in the area that have been sold recently, a determination and consideration of its replacement cost and depreciation and consideration of the income-producing potential. All appraisal reports are office-reviewed, then rechecked in the field by experienced, qualified

	review appraisers for accuracy. Since the Division of Highways has adopted a firm price policy, the property owner will be offered the full amount of the approved appraisal. There will be no attempt to buy property at less than fair market value. This policy guarantees that all citizens of the state receive full value for the money expended for highway rights of way. Those who hold a valid property interest in the property that is acquired for the project will be compensated during the ROW acquisition phase.
525	Drainage issues within the project footprint will be addressed by the project design. During final design, further avoidance and/or minimization measures will be considered and/or implemented as appropriate to reduce the total impacts to streams. Specific Best Management Practices will be developed prior to construction to reduce the amount of disturbed aquatic habitat and riparian vegetation; minimize opportunities for increased sedimentation during construction; revegetate all disturbed areas to prevent accelerated erosion; designate equipment fueling and service areas away from aquatic habitats; and designate and construct all stormwater management facilities to prevent runoff. Coordination with resource agencies will continue throughout construction activities as necessary.
526	The preliminary investigation and engineering traffic study has examined two build alternatives and three options for each of the major intersections. The intersection options that were evaluated and analyzed include turning lanes, traffic signals, and roundabouts. WVDOH requires intersection improvements to meet or exceed an overall intersection LOS C or better during the peak hours studied for design year improvements. The times of day (peak hours) selected to be studied followed WVDOH guidelines and is standard traffic engineering practice for determining future intersection improvements. The option included upgrading the signal lights to have a protected/permissive left turn phase. The analysis showed that this option would result in some intersection improvements but could not achieve LOS C or better for the overall intersection operation. The overall intersection would operate at an unacceptable LOS (LOS E). In addition, the left turn lane option would result in the eastbound Greenbag Road traffic queue to extend past the Bluegrass Village Driveway. The traffic analysis determined that with installation of a roundabout the overall intersection would operate at a LOS C, meeting WVDOH design year criteria. The EA reported impacts to Federal Farmland Protection Policy Act (FPPA) soils. The entire Greenbag Road environmental study area is encompassed by “land already in or committed to urban development” as defined by the FPPA (see 7 CFR § 658.2 - Definitions) and is therefore not subject to provisions of FPPA. Please refer to the Farmland Appendix attached to the FONSI for further detail. Conscious Harvest Cooperative Community Garden, Joy and Hemp Universal LLC, and Mockingbird Hill Farms are located on private property and the property owner will be compensated for the sale of any land to the WVDOH during the right-of-way acquisition process. Impacts to this parcel have been minimized to the extent practicable. Approximately 1.56 acres (67,900 square feet) will be required from the parcel.

	Fair market value will be paid for all properties that require full or partial acquisition as a result of the project. When only part of the property is required, as is the case with this parcel, fair market value of the part taken will be paid, plus damages, if any, to the residue, less all benefits. West Virginia law defines "market value" as the price a willing buyer would pay a willing seller, neither acting under compulsion nor duress, both exercising prudence and intelligent judgment as to its value and familiar with the purpose for which the property is reasonably available. Fair market value will be determined by a competent, professional real estate appraiser after a thorough inspection of the property, a comparison with similar properties in the area that have been sold recently, a determination and consideration of its replacement cost and depreciation and consideration of the income-producing potential. All appraisal reports are office-reviewed, then rechecked in the field by experienced, qualified review appraisers for accuracy. Since the Division of Highways has adopted a firm price policy, the property owner will be offered the full amount of the approved appraisal. There will be no attempt to buy property at less than fair market value. This policy guarantees that all citizens of the state receive full value for the money expended for highway rights of way. Those who hold a valid property interest in the property that is acquired for the project will be compensated during the ROW acquisition phase.
527	The EA reported impacts to Federal Farmland Protection Policy Act (FPPA) soils. The entire Greenbag Road environmental study area is encompassed by "land already in or committed to urban development" as defined by the FPPA (see 7 CFR § 658.2 - Definitions) and is therefore not subject to provisions of FPPA. Please refer to the Farmland Appendix attached to the FONSI for further detail. There will be no attempt to buy property at less than fair market value. This policy guarantees that all citizens of the state receive full value for the money expended for highway rights of way. Those who hold a valid property interest in the property that is acquired for the project will be compensated during the ROW acquisition phase.
528	The preliminary investigation and engineering traffic study was completed to evaluate the Greenbag Road corridor, evaluating the existing and potential future operation of the intersections selected for study by WVDOH. The Greenbag Road corridor has long been recognized as a challenging roadway to navigate due to geometric deficiencies, significant intersection delays during the peak hours, and increased volume of truck traffic and development within the corridor. Several studies have been previously completed through the MMMPO, evaluating various

	transportation plans for the Greenbag Road corridor, with the ultimate vision of transforming Greenbag Road into a safe, efficient, and attractive multimodal transportation facility. The future traffic along Greenbag Road, Mississippi Avenue, Dorsey Avenue, Kingwood Pike were projected for the future design year by assuming existing traffic distribution/patterns but with increased traffic volumes though application of a yearly traffic growth rate of 1.16% per year. It should be noted that the traffic evaluation was completed prior to the COVID-19 pandemic and its effects to traffic currently occurring.
529	This comment is noted.
530	The traffic control plan, which will outline the intended traffic detour tour, will continue to be revised during final design. It should be noted that Aaron's Creek Road will not be utilized as a signed detour. The anticipated plan intends to utilize the center of the Dorsey Avenue /Kingwood Pike roundabout as a temporary intersection with temporary traffic signals during construction. A short-term detour is proposed using Summers School Road while constructing the connection of the existing Kingwood Pike with the new portion.
531	A shared-use path was part of some early versions of the project, but the right of way impacts along Bluegrass Village and the Kennedy Center were significant. Due to these detrimental impacts the shared use path was removed from the alternatives that were advanced to the EA. The sidewalk design has been extended from the western end of the project area along Greenbag Road to the Dorsey Avenue/Kingwood Pike intersection. At the intersection the sidewalk follows Dorsey Avenue north to Luckey Lane and east on Luckey Lane to the connection with the existing sidewalk at Mountainview Elementary School. The shoulder along the north side of Greenbag Road is being designed to accommodate bicycle use by being wider (3 feet) than the standard shoulder (2 feet). Extensions beyond the scope of this project can be considered during future planning. Thank you for enumerating the safety concerns and the proposed HAWK beacon crosswalk.
532	A shared-use path was part of some early versions of the project, but the right of way impacts along Bluegrass Village and the Kennedy Center were significant. Due to these detrimental impacts the shared use path was removed from the alternatives that were advanced to the EA. The sidewalk design has been extended from the western end of the project area along Greenbag Road to the Dorsey Avenue/Kingwood Pike intersection. At the intersection the sidewalk follows Dorsey Avenue north to Luckey Lane and east on Luckey Lane to the connection with the existing sidewalk at Mountainview Elementary School. The shoulder along the north side of Greenbag Road is being designed to accommodate bicycle use by being wider (3 feet) than the standard shoulder (2 feet). Extensions beyond the scope of this project can be considered during future planning. The preliminary investigation and engineering traffic study has examined two build alternatives and three options for each of the major intersections. The intersection options that were evaluated and analyzed include turning lanes, traffic signals, and roundabouts. WVDOH requires intersection improvements to meet or exceed an overall intersection LOS C or better during the peak hours studied for design year improvements. The times of day (peak hours) selected to be studied followed WVDOH guidelines and is standard traffic engineering practice for determining future intersection improvements. At the intersection of Greenbag Road/Dorsey Avenue/Kingwood Pike the traffic analysis determined that the intersection would operate at failure (overall intersection LOS F) if existing intersection conditions and operations were to remain the same 30-years in the future (design year) without any improvements. Adding only left turn lanes on Greenbag Road at the Dorsey/Kingwood Pike intersection was evaluated during

	an initial round of traffic analysis because this option had been suggested by the MPO. The option included upgrading the signal lights to have a protected/permissive left turn phase. The analysis showed that this option would result in some intersection improvements but could not achieve LOS C or better for the overall intersection operation. The overall intersection would operate at an unacceptable LOS (LOS E). In addition, the left turn lane option would result in the eastbound Greenbag Road traffic queue to extend past the Bluegrass Village Driveway. The traffic analysis determined that with installation of a roundabout the overall intersection would operate at a LOS C, meeting WVDOH design year criteria. At the intersection of Greenbag Road/Mississippi Avenue the traffic analysis determined that the intersection would operate at failure (overall intersection LOS F) if existing intersection conditions and operations were to remain the same 30-years in the future (design year) without any improvements. The design year with improvements scenarios evaluated determined that with installation of a roundabout the overall intersection would operate at a LOS A, best operating conditions, for all peak hours studied. Installation of a traffic signal with turn lanes resulted in an overall intersection LOS B during the AM peak hour, with the Mississippi Avenue approach operating at a LOS C. Though the analysis meets WVDOH minimum LOS criteria, the roundabout option exceeds WVDOH minimum LOS criteria. Roundabouts help reduce vehicular delay and promotes a continuous flow of traffic, which increases traffic capacity at an intersection. The roundabouts have been designed with larger vehicles in mind and incorporate truck aprons to support the weight and turning radius of larger vehicles, including school buses. In addition, roundabouts help reduce the likelihood and severity of collisions. Studies by the Federal Highway Administration (FHWA) have shown that roundabouts typically achieve reduction in overall collisions, injury collisions, fatality collisions, and pedestrian collisions. Reasons for these reductions due to the installation of a roundabout include: - Low travel speeds – Drivers must slow down and yield to traffic before entering a roundabout. The reduction in speeds results in a decrease in crash severity and injury. - No traffic light “to beat” – The design of a roundabout promotes a continuous circular flow of traffic. Because of this design, drivers will not have the incentive to speed up to “beat the light”, like they may at a traditional intersection. - One way travel – The design of a roundabout directs drivers through gently designed curves into a one-way counterclockwise circular path. This design eliminates the possibilities for T-bone and head-on collisions. In addition, a conventional 4-way intersection has 32 points of vehicle conflict due to the different crossings and maneuvers through the intersection. A roundabout has 8 points of conflict, which all occur in the same direction, reducing crash severity and likelihood of injury.
533	A shared-use path was part of some early versions of the project, but the right of way impacts along Bluegrass Village and the Kennedy Center were significant. Due to these detrimental impacts the shared use path was removed from the alternatives that were advanced to the EA. The sidewalk design has been extended from the western end of the project area along Greenbag Road to the Dorsey Avenue/Kingwood Pike intersection. At the intersection the sidewalk follows Dorsey Avenue north to Luckey Lane and east on Luckey Lane to the connection with the existing sidewalk at Mountainview Elementary School. The shoulder along the north side of Greenbag Road is being designed to accommodate

	bicycle use by being wider (3 feet) than the standard shoulder (2 feet). Extensions beyond the scope of this project can be considered during future planning. Thank you for enumerating the safety concerns and the proposed HAWK beacon crosswalk.
534	A shared-use path was part of some early versions of the project, but the right of way impacts along Bluegrass Village and the Kennedy Center were significant. Due to these detrimental impacts the shared use path was removed from the alternatives that were advanced to the EA. The sidewalk design has been extended from the western end of the project area along Greenbag Road to the Dorsey Avenue/Kingwood Pike intersection. At the intersection the sidewalk follows Dorsey Avenue north to Luckey Lane and east on Luckey Lane to the connection with the existing sidewalk at Mountainview Elementary School. The shoulder along the north side of Greenbag Road is being designed to accommodate bicycle use by being wider (3 feet) than the standard shoulder (2 feet). Extensions beyond the scope of this project can be considered during future planning. Thank you for enumerating the safety concerns and the proposed HAWK beacon crosswalk.
535	A shared-use path was part of some early versions of the project, but the right of way impacts along Bluegrass Village and the Kennedy Center were significant. Due to these detrimental impacts the shared use path was removed from the alternatives that were advanced to the EA. The sidewalk design has been extended from the western end of the project area along Greenbag Road to the Dorsey Avenue/Kingwood Pike intersection. At the intersection the sidewalk follows Dorsey Avenue north to Luckey Lane and east on Luckey Lane to the connection with the existing sidewalk at Mountainview Elementary School. The shoulder along the north side of Greenbag Road is being designed to accommodate bicycle use by being wider (3 feet) than the standard shoulder (2 feet). Extensions beyond the scope of this project can be considered during future planning. Thank you for enumerating the safety concerns and the proposed HAWK beacon crosswalk.
536	A shared-use path was part of some early versions of the project, but the right of way impacts along Bluegrass Village and the Kennedy Center were significant. Due to these detrimental impacts the shared use path was removed from the alternatives that were advanced to the EA. The sidewalk design has been extended from the western end of the project area along Greenbag Road to the Dorsey Avenue/Kingwood Pike intersection. At the intersection the sidewalk follows Dorsey Avenue north to Luckey Lane and east on Luckey Lane to the connection with the existing sidewalk at Mountainview Elementary School. The shoulder along the north side of Greenbag Road is being designed to accommodate bicycle use by being wider (3 feet) than the standard shoulder (2 feet). Extensions beyond the scope of this project can be considered during future planning. Thank you for enumerating the safety concerns and the proposed HAWK beacon. The WVDOH will examine all safety concerns as part of the final design.
537	Both the MMMPO corridor study and the 2018 traffic study determined that traffic flow through the corridor is controlled by the congestion at the major intersections in the corridor. The projected growth in the Morgantown area will continue to increase traffic and congestion at the intersections if improvements do not occur. The EA reviewed multiple alternatives including turn lanes, traffic lights, and the roundabouts. Through the analysis in the EA, the only alternative that meets the purpose and need of the project is the roundabout. Road repair beyond the scope of this project is being addressed through the Governor's Roads to Prosperity program and progress can be tracked via the WVDOH website.

	The EA reported impacts to Federal Farmland Protection Policy Act (FPPA) soils. The entire Greenbag Road environmental study area is encompassed by "land already in or committed to urban development" as defined by the FPPA (see 7 CFR § 658.2 - Definitions) and is therefore not subject to provisions of FPPA. Please refer to the Farmland Appendix attached to the FONSI for further detail. Conscious Harvest Cooperative Community Garden, Joy and Hemp Universal LLC, and Mockingbird Hill Farms are located on private property and the property owner will be compensated for the sale of any land to the WVDOH during the right-of-way acquisition process. Impacts to this parcel have been minimized to the extent practicable. Approximately 1.56 acres (67,900 square feet) will be required from the parcel. Fair market value will be paid for all properties that require full or partial acquisition as a result of the project. When only part of the property is required, as is the case with this parcel, fair market value of the part taken will be paid, plus damages, if any, to the residue, less all benefits. West Virginia law defines "market value" as the price a willing buyer would pay a willing seller, neither acting under compulsion nor duress, both exercising prudence and intelligent judgment as to its value and familiar with the purpose for which the property is reasonably available. Fair market value will be determined by a competent, professional real estate appraiser after a thorough inspection of the property, a comparison with similar properties in the area that have been sold recently, a determination and consideration of its replacement cost and depreciation and consideration of the income-producing potential. All appraisal reports are office-reviewed, then rechecked in the field by experienced, qualified review appraisers for accuracy. Since the Division of Highways has adopted a firm price policy, the property owner will be offered the full amount of the approved appraisal. There will be no attempt to buy property at less than fair market value. This policy guarantees that all citizens of the state receive full value for the money expended for highway rights of way. Those who hold a valid property interest in the property that is acquired for the project will be compensated during the ROW acquisition phase.
538	The preliminary investigation and engineering traffic study has examined two build alternatives and three options for each of the major intersections. The intersection options that were evaluated and analyzed include turning lanes, traffic signals, and roundabouts. WVDOH requires intersection improvements to meet or exceed an overall intersection LOS C or better during the peak hours studied for design year improvements. The times of day (peak hours) selected to be studied followed WVDOH guidelines and is standard traffic engineering practice for determining future intersection improvements. At the intersection of Greenbag Road/Dorsey Avenue/Kingwood Pike the traffic analysis determined that the intersection would operate at failure (overall intersection LOS F) if existing intersection conditions and operations were to remain the same 30-years in the future (design year) without any improvements. Adding only left turn lanes on Greenbag Road at the Dorsey/Kingwood Pike intersection was evaluated during an initial round of traffic analysis because this option had been suggested by the MPO. The option included upgrading the signal lights to have a protected/permissive left turn phase. The analysis showed that this option would result in some intersection improvements but could not achieve LOS C or better for the overall intersection operation. The overall intersection would operate at an unacceptable LOS (LOS E). In addition, the left turn lane option would result in the eastbound Greenbag Road traffic queue to extend past the Bluegrass Village Driveway. The traffic analysis determined that with installation of a roundabout the overall intersection would operate at a LOS C, meeting WVDOH design year criteria.

	At the intersection of Greenbag Road/Mississippi Avenue the traffic analysis determined that the intersection would operate at failure (overall intersection LOS F) if existing intersection conditions and operations were to remain the same 30-years in the future (design year) without any improvements. The design year with improvements scenarios evaluated determined that with installation of a roundabout the overall intersection would operate at a LOS A, best operating conditions, for all peak hours studied. Installation of a traffic signal with turn lanes resulted in an overall intersection LOS B during the AM peak hour, with the Mississippi Avenue approach operating at a LOS C. Though the analysis meets WVDOH minimum LOS criteria, the roundabout option exceeds WVDOH minimum LOS criteria. Roundabouts help reduce vehicular delay and promotes a continuous flow of traffic, which increases traffic capacity at an intersection.
539	The preliminary investigation and engineering traffic study has examined two build alternatives and three options for each of the major intersections. The intersection options that were evaluated and analyzed include turning lanes, traffic signals, and roundabouts. WVDOH requires intersection improvements to meet or exceed an overall intersection LOS C or better during the peak hours studied for design year improvements. The times of day (peak hours) selected to be studied followed WVDOH guidelines and is standard traffic engineering practice for determining future intersection improvements. At the intersection of Greenbag Road/Dorsey Avenue/Kingwood Pike the traffic analysis determined that the intersection would operate at failure (overall intersection LOS F) if existing intersection conditions and operations were to remain the same 30-years in the future (design year) without any improvements. Adding only left turn lanes on Greenbag Road at the Dorsey/Kingwood Pike intersection was evaluated during an initial round of traffic analysis because this option had been suggested by the MPO. The option included upgrading the signal lights to have a protected/permissive left turn phase. The analysis showed that this option would result in some intersection improvements but could not achieve LOS C or better for the overall intersection operation. The overall intersection would operate at an unacceptable LOS (LOS E). In addition, the left turn lane option would result in the eastbound Greenbag Road traffic queue to extend past the Bluegrass Village Driveway. Based on these findings and at the direction of the WVDOH, the traffic analysis was revised using additional options, which developed into Options D and E examined for the EA. The left turn lane only on Greenbag Road was not developed further and no impacts were assessed for the EA. The traffic analysis determined that with installation of a roundabout the overall intersection would operate at a LOS C, meeting WVDOH design year criteria. Conscious Harvest Cooperative Community Garden, Joy and Hemp Universal LLC, and Mockingbird Hill Farms are located on private property and the property owner will be compensated for the sale of any land to the WVDOH during the right-of-way acquisition process. Impacts to this parcel have been minimized to the extent practicable. Approximately 1.56 acres (67,900 square feet) will be required from the parcel. Fair market value will be paid for all properties that require full or partial acquisition as a result of the project. When only part of the property is required, as is the case with this parcel, fair market value of the part taken will be paid, plus damages, if any, to the residue, less all benefits. West Virginia law defines “market value” as the price a willing buyer would pay a willing seller, neither acting under compulsion nor duress, both exercising prudence and intelligent judgment as to its value and familiar with the purpose for which the property is reasonably available. Fair market value will be determined by a competent, professional real estate appraiser after a thorough inspection of the property, a comparison with similar properties in the area that have been sold recently, a determination and consideration of its replacement cost and depreciation and consideration of the income-producing potential. All appraisal reports are office-reviewed, then rechecked in the field by experienced, qualified

	review appraisers for accuracy. Since the Division of Highways has adopted a firm price policy, the property owner will be offered the full amount of the approved appraisal. There will be no attempt to buy property at less than fair market value. This policy guarantees that all citizens of the state receive full value for the money expended for highway rights of way. Those who hold a valid property interest in the property that is acquired for the project will be compensated during the ROW acquisition phase.
540	All comments received by the WVDOH have been included and considered during the analysis and development of the project. Findings from the Environmental studies (aquatic resources such as streams and wetlands; rare, threatened and endangered species of plants and animals; floodplains; farmlands; groundwater; hazardous materials; air quality; and noise) that were conducted to evaluate impacts associated with the proposed project are documented in the EA. The EA was reviewed and approved by FHWA on August 28, 2020.
541	The virtual meeting was advertised in the WV legal ads, on a message board in the project area, and through the Morgantown Monongalia MPO. Emails were sent to all commenters from the April 2019 meeting who had provided a valid email address and postcards were mailed to all commenters from the April 2019 meeting who had provided a complete mailing address. During the September 29, 2020 virtual public meeting, the WVDOH personnel mentioned during each presentation that live phone calls would not be taken. However, there is “leave a voicemail” option those would be transcribed. The online commenting period was available beginning on September 29 and ending on November 30, 2020 for a 60-day comment period as opposed to the standard 30-day comment period. Numbers of responses to WVDOH roadway projects vary based on the location within the state, and the type and scale of the project. The FHWA approved the use of a virtual public meeting based on the public health concerns related to the COVID-19 pandemic. Virtual public meetings have not been used by the WVDOH prior to the global pandemic therefore data to provide cost comparisons is not available. The virtual public meeting for the Greenbag Road project was the second meeting held virtually by the WVDOH. The public meeting was held from 5 to 8 pm while the presidential debate did not begin until 9 pm so there was no overlap between the two events.
542	The EA reviewed multiple alternatives including turn lanes, traffic lights, and the roundabouts. Through the analysis in the EA, the only alternative that meets the purpose and need of the project is the roundabout. Conscious Harvest Cooperative Community Garden, Joy and Hemp Universal LLC, and Mockingbird Hill Farms are located on private property and the property owner will be compensated for the sale of any land to the WVDOH during the right-of-way acquisition process. Impacts to this parcel have been minimized to the extent practicable. Approximately 1.56 acres (67,900 square feet) will be required from the parcel. Fair market value will be paid for all properties that require full or partial acquisition as a result of the project. When only part of the property is required, as is the case with this parcel, fair market value of the part taken will be paid, plus damages, if any, to the residue, less all benefits. West Virginia law defines “market value” as the price a willing buyer would pay a willing seller, neither acting under compulsion nor duress, both exercising prudence and intelligent judgment as to its value and familiar with the purpose for which the property is reasonably available. Fair market value will be determined by a competent, professional real estate appraiser after a thorough inspection of the property, a comparison

	with similar properties in the area that have been sold recently, a determination and consideration of its replacement cost and depreciation and consideration of the income-producing potential. All appraisal reports are office-reviewed, then rechecked in the field by experienced, qualified review appraisers for accuracy. Since the Division of Highways has adopted a firm price policy, the property owner will be offered the full amount of the approved appraisal. There will be no attempt to buy property at less than fair market value. This policy guarantees that all citizens of the state receive full value for the money expended for highway rights of way. Those who hold a valid property interest in the property that is acquired for the project will be compensated during the ROW acquisition phase.
543	The MMMPO had completed several previous studies evaluating various transportation plans for the Greenbag Road corridor, with the ultimate vision of transforming Greenbag Road into a safe, efficient, and attractive multimodal transportation facility. The scenarios determined to be evaluated in the traffic study evolved from the outcome of the MMMPO's preliminary studies and findings. Existing two-way stop controlled operations with potential roadway improvements were evaluated as part of the traffic, as well as traffic signal and roundabout options. The intersection of Greenbag Road/Dorsey Avenue/Kingwood Pike is currently controlled by a traffic signal and not by a four-way (all-way) stop, which includes stop sign control on each approach. The intersection would operate at failure (overall intersection LOS F) if existing intersection conditions and operations (traffic signal control) were to remain the same 30-years in the future (design year) without any improvements. Conscious Harvest Cooperative Community Garden, Joy and Hemp Universal LLC, and Mockingbird Hill Farms are located on private property and the property owner will be compensated for the sale of any land to the WVDOH during the right-of-way acquisition process. Impacts to this parcel have been minimized to the extent practicable. Approximately 1.56 acres (67,900 square feet) will be required from the parcel. Fair market value will be paid for all properties that require full or partial acquisition as a result of the project. When only part of the property is required, as is the case with this parcel, fair market value of the part taken will be paid, plus damages, if any, to the residue, less all benefits. West Virginia law defines "market value" as the price a willing buyer would pay a willing seller, neither acting under compulsion nor duress, both exercising prudence and intelligent judgment as to its value and familiar with the purpose for which the property is reasonably available. Fair market value will be determined by a competent, professional real estate appraiser after a thorough inspection of the property, a comparison with similar properties in the area that have been sold recently, a determination and consideration of its replacement cost and depreciation and consideration of the income-producing potential. All appraisal reports are office-reviewed, then rechecked in the field by experienced, qualified review appraisers for accuracy. Since the Division of Highways has adopted a firm price policy, the property owner will be offered the full amount of the approved appraisal. There will be no attempt to buy property at less than fair market value. This policy guarantees that all citizens of the state receive full value for the money expended for highway rights of way. Those who hold a valid property interest in the property that is acquired for the project will be compensated during the ROW acquisition phase.
544	There are no direct impacts anticipated for the residences on Dorsey Avenue as a result of Option F.

	The noise analysis report indicates the Greenbag Road and intersection improvements for this alternative do not meet the requirements for either a Type I or Type II project. The Project is classified as a Type III project and a detailed noise analysis for highway traffic noise impacts was not required. The Type III noise analysis is available as an Appendix to the EA on the WVDOH website at https://transportation.wv.gov/highways/engineering/comment/closed/greenbagroadimprovementproject/Pages/default.aspx. Roundabouts are designed to maintain a constant flow of traffic through the intersection which results in reduced congestion on roadways and a reduction in delays for drivers. Studies have shown that changing signalized intersections to roundabouts can have up to an 89% average reduction in vehicle delays. The improved traffic flow also results in reduced vehicle emissions including carbon monoxide, nitrous oxide, and carbon dioxide at the intersection. The proposed project includes improvements to an existing transportation facility and the construction of the project is not expected to stimulate secondary growth, affect land use decisions, or induce land use change. Therefore, the project is not expected to result in light pollution impacts that are significantly worse than conditions currently present within the project area. The lighting layout for the roundabout will be developed during final design. The lighting will be designed to attempt to minimize light pollution while maintaining FHWA and WVDOH standards and requirements for lighting of the roundabout.
545	Conscious Harvest Cooperative Community Garden, Joy and Hemp Universal LLC, and Mockingbird Hill Farms are located on private property and the property owner will be compensated for the sale of any land to the WVDOH during the right-of-way acquisition process. Impacts to this parcel have been minimized to the extent practicable. Approximately 1.56 acres (67,900 square feet) will be required from the parcel. Fair market value will be paid for all properties that require full or partial acquisition as a result of the project. When only part of the property is required, as is the case with this parcel, fair market value of the part taken will be paid, plus damages, if any, to the residue, less all benefits. West Virginia law defines “market value” as the price a willing buyer would pay a willing seller, neither acting under compulsion nor duress, both exercising prudence and intelligent judgment as to its value and familiar with the purpose for which the property is reasonably available. Fair market value will be determined by a competent, professional real estate appraiser after a thorough inspection of the property, a comparison with similar properties in the area that have been sold recently, a determination and consideration of its replacement cost and depreciation and consideration of the income-producing potential. All appraisal reports are office-reviewed, then rechecked in the field by experienced, qualified review appraisers for accuracy. Since the Division of Highways has adopted a firm price policy, the property owner will be offered the full amount of the approved appraisal. There will be no attempt to buy property at less than fair market value. This policy guarantees that all citizens of the state receive full value for the money expended for highway rights of way. Those who hold a valid property interest in the property that is acquired for the project will be compensated during the ROW acquisition phase. One of the major differences between Greenbag Road and the Mileground, is the volume of traffic. Greenbag Road has less than half the traffic volume that Mileground has. A second major difference is the general configuration of the roundabouts. The proposed roundabouts on Greenbag are more straightforward and more traditional roundabout designs, without all of the confusing lanes that are present at Mileground. The roundabouts on Greenbag Road will be more intuitive for drivers.

	The MMMPO had completed several previous studies evaluating various transportation plans for the Greenbag Road corridor, with the ultimate vision of transforming Greenbag Road into a safe, efficient, and attractive multimodal transportation facility. The scenarios determined to be evaluated in the traffic study evolved from the outcome of the MMMPO's preliminary studies and findings. Existing two-way stop controlled operations with potential roadway improvements were evaluated as part of the traffic, as well as traffic signal and roundabout options. The intersection of Greenbag Road/Dorsey Avenue/Kingwood Pike is currently controlled by a traffic signal and not by a four-way (all-way) stop, which includes stop sign control on each approach. The intersection would operate at failure (overall intersection LOS F) if existing intersection conditions and operations (traffic signal control) were to remain the same 30-years in the future (design year) without any improvements. Therefore, traffic analysis was not completed for a four-way (all-way) stop controlled intersection operations.
546	The EA analyzed potential impacts to social, cultural, natural, economic, and environmental resource factors. All impacts will be minimized to the extent practicable. Please refer to the EA and appendices for more information: https://transportation.wv.gov/highways/engineering/comment/closed/greenbagroadimprovementproject/Pages/default.aspx. Conscious Harvest Cooperative Community Garden, Joy and Hemp Universal LLC, and Mockingbird Hill Farms are located on private property and the property owner will be compensated for the sale of any land to the WVDOH during the right-of-way acquisition process. Impacts to this parcel have been minimized to the extent practicable. Approximately 1.56 acres (67,900 square feet) will be required from the parcel. Fair market value will be paid for all properties that require full or partial acquisition as a result of the project. When only part of the property is required, as is the case with this parcel, fair market value of the part taken will be paid, plus damages, if any, to the residue, less all benefits. West Virginia law defines "market value" as the price a willing buyer would pay a willing seller, neither acting under compulsion nor duress, both exercising prudence and intelligent judgment as to its value and familiar with the purpose for which the property is reasonably available. Fair market value will be determined by a competent, professional real estate appraiser after a thorough inspection of the property, a comparison with similar properties in the area that have been sold recently, a determination and consideration of its replacement cost and depreciation and consideration of the income-producing potential. All appraisal reports are office-reviewed, then rechecked in the field by experienced, qualified review appraisers for accuracy. Since the Division of Highways has adopted a firm price policy, the property owner will be offered the full amount of the approved appraisal. There will be no attempt to buy property at less than fair market value. This policy guarantees that all citizens of the state receive full value for the money expended for highway rights of way. Those who hold a valid property interest in the property that is acquired for the project will be compensated during the ROW acquisition phase.
547	This comment is noted.
548	The preliminary investigation and engineering traffic study was completed to evaluate the Greenbag Road corridor, evaluating the existing and potential future operation of the intersections selected for study by WVDOH. The Greenbag Road corridor has long been recognized as a challenging roadway to navigate due to geometric deficiencies, significant intersection delays during the peak hours, and increased volume of truck traffic and development within the corridor. Several studies have been previously completed through the MMMPO, evaluating various transportation plans for the Greenbag Road corridor, with the ultimate vision of transforming Greenbag Road into a safe, efficient, and attractive

	multimodal transportation facility. It should be noted that the traffic evaluation was completed prior to the COVID-19 pandemic and its effects to traffic currently occurring. The EA process is designed to include opportunity for landowners and public stakeholders to provide comment and feedback which is considered and included in the final decision process. Any property needed for the project will be acquired under the Uniform Relocation Assistance and Real Property Acquisition Act (1970) through negotiations with the landowners. The diversion of traffic, including truck traffic, from downtown is not within the scope of this project.
549	Roundabouts help reduce the likelihood and severity of collisions. Studies by the Federal Highway Administration (FHWA) have shown that roundabouts typically achieve reduction in overall collisions, injury collisions, fatality collisions, and pedestrian collisions. Reasons for these reductions due to the installation of a roundabout include: - Low travel speeds – Drivers must slow down and yield to traffic before entering a roundabout. The reduction in speeds results in a decrease in crash severity and injury. - No traffic light "to beat" – The design of a roundabout promotes a continuous circular flow of traffic. Because of this design, drivers will not have the incentive to speed up to "beat the light", like they may at a traditional intersection. - One way travel – The design of a roundabout directs drivers through gently designed curves into a one-way counterclockwise circular path. This design eliminates the possibilities for T-bone and head-on collisions. In addition, a conventional 4-way intersection has 32 points of vehicle conflict due to the different crossings and maneuvers through the intersection. A roundabout has 8 points of conflict, which all occur in the same direction, reducing crash severity and likelihood of injury. Lastly, long-term costs associated with roundabouts are significantly less than a traffic signal, since no electrical costs and no traffic signal maintenance costs are involved with a roundabout.
550	One of the major differences between Greenbag Road and the Mileground, is the volume of traffic. Greenbag Road has less than half the traffic volume that Mileground has. A second major difference is the general configuration of the roundabouts. The proposed roundabouts on Greenbag are more straightforward and more traditional roundabout designs, without all of the confusing lanes that are present at Mileground. The roundabouts on Greenbag Road will be more intuitive for drivers. Roundabouts help reduce the likelihood and severity of collisions. Studies by the Federal Highway Administration (FHWA) have shown that roundabouts typically achieve reduction in overall collisions, injury collisions, fatality collisions, and pedestrian collisions. Reasons for these reductions due to the installation of a roundabout include:

551	The EA reported impacts to Federal Farmland Protection Policy Act (FPPA) soils. The entire Greenbag Road environmental study area is encompassed by "land already in or committed to urban development" as defined by the FPPA (see 7 CFR § 658.2 - Definitions) and is therefore not subject to provisions of FPPA. Please refer to the Farmland Appendix attached to the FONSI for further detail. Conscious Harvest Cooperative Community Garden, Joy and Hemp Universal LLC, and Mockingbird Hill Farms are located on private property and the property owner will be compensated for the sale of any land to the WVDOH during the right-of-way acquisition process. Impacts to this parcel have been minimized to the extent practicable. Approximately 1.56 acres (67,900 square feet) will be required from the parcel. Fair market value will be paid for all properties that require full or partial acquisition as a result of the project. When only part of the property is required, as is the case with this parcel, fair market value of the part taken will be paid, plus damages, if any, to the residue, less all benefits. West Virginia law defines "market value" as the price a willing buyer would pay a willing seller, neither acting under compulsion nor duress, both exercising prudence and intelligent judgment as to its value and familiar with the purpose for which the property is reasonably available. Fair market value will be determined by a competent, professional real estate appraiser after a thorough inspection of the property, a comparison with similar properties in the area that have been sold recently, a determination and consideration of its replacement cost and depreciation and consideration of the income-producing potential. All appraisal reports are office-reviewed, then rechecked in the field by experienced, qualified review appraisers for accuracy. Since the Division of Highways has adopted a firm price policy, the property owner will be offered the full amount of the approved appraisal. There will be no attempt to buy property at less than fair market value. This policy guarantees that all citizens of the state receive full value for the money expended for highway rights of way. Those who hold a valid property interest in the property that is acquired for the project will be compensated during the ROW acquisition phase. Parking issues in downtown Morgantown are beyond the scope of the current project.

552	The roundabouts were designed to accommodate AASHTO WB-62 truck configuration, which is an interstate semi-truck with a 62' wheel base between steer axle and last trailer axle, including a 48' trailer. Larger trucks can navigate the roundabout and use the internal truck apron.
553	The roundabouts were designed to accommodate AASHTO WB-62 truck configuration, which is an interstate semi-truck with a 62' wheel base between steer axle and last trailer axle, including a 48' trailer. A roundabout has 8 points of conflict, which all occur in the same direction, reducing crash severity and likelihood of injury. Lastly, long-term costs associated with roundabouts are significantly less than a traffic signal, since no electrical costs and no traffic signal maintenance costs are involved with a roundabout. Road repair beyond the scope of this project is being addressed through the Governor's Roads to Prosperity program and progress can be tracked via the WVDOH website.

557	The roundabouts were designed to accommodate AASHTO WB-62 truck configuration, which is an interstate semi-truck with a 62' wheel base between steer axle and last trailer axle, including a 48' trailer. Larger trucks can navigate the roundabout and use the internal truck apron.
558	The West Virginia Division of Highways (WVDOH) does not "steal" property. Any property needed for the project will be acquired under the Uniform Relocation Assistance and Real Property Acquisition Act (1970).
559	The West Run bypass and airport are both outside the scope of the current project.
560	The preliminary investigation and engineering traffic study was completed to evaluate the Greenbag Road corridor, evaluating the existing and potential future operation of the intersections selected for study by WVDOH. The Greenbag Road corridor has long been recognized as a challenging roadway to navigate due to geometric deficiencies, significant intersection delays during the peak hours, and increased volume of truck traffic and development within the corridor. The study used a forecasted growth rate of 1.16% per year provided by the MMMPO to create projections for the design year (2048) levels of service. Forecasted 2048 level of service for the Dorsey Avenue/Kingwood Pike intersection is C in morning and F in evening and for Mississippi Street an F in the morning and a D in the evening indicating that as the Morgantown area continues to grow the traffic congestion at these intersections will increase as well. Increased congestion leads to longer travel times and more opportunities for safety incidents and serious injuries. Several studies have been previously completed through the MMMPO, evaluating various transportation plans for the Greenbag Road corridor, with the ultimate vision of transforming Greenbag Road into a safe, efficient, and attractive multimodal transportation facility. It should be noted that the traffic evaluation was completed prior to the COVID-19 pandemic and its effects to traffic currently occurring.

565	Both the MMMPO corridor study and the 2018 traffic study determined that traffic flow through the corridor is controlled by the congestion at the major intersections in the corridor. The projected growth in the Morgantown area will continue to increase traffic and congestion at the intersections if improvements do not occur. The MMMPO had completed several previous studies evaluating various transportation plans for the Greenbag Road corridor, with the ultimate vision of transforming Greenbag Road into a safe, efficient, and attractive multimodal transportation facility. The scenarios determined to be evaluated in the traffic study evolved from the outcome of the MMMPO’s preliminary studies and findings. Designs for the intersection improvements have factored the topography, safety issues, constructability, and current land use to develop feasible alternatives. Existing two-way stop controlled operations with potential roadway improvements were evaluated as part of the traffic, as well as traffic signal and roundabout options. The evaluation and analysis of these intersection options indicate that the roundabout would provide the most improvement to traffic congestion, has the lowest estimated construction cost, and does not displace any residences.
566	The West Virginia Division of Highways does not “steal” property. Any property needed for the project will be acquired under the Uniform Relocation Assistance and Real Property Acquisition Act (1970).
567	All comments received during the public comment period are included as part of this project record. Any property needed for the project will be acquired under the Uniform Relocation Assistance and Real Property Acquisition Act (1970).
568	The West Virginia Division of Highways does not “steal” property. Any property needed for the project will be acquired under the Uniform Relocation Assistance and Real Property Acquisition Act (1970).

	Conscious Harvest Cooperative Community Garden, Joy and Hemp Universal LLC, and Mockingbird Hill Farms are located on private property and the property owner will be compensated for the sale of any land to the WVDOH during the right-of-way acquisition process. 569	The roundabouts were designed to accommodate AASHTO WB-62 truck configuration, which is an interstate semi-truck with a 62' wheel base between steer axle and last trailer axle, including a 48' trailer. Larger trucks can navigate the roundabout and use the internal truck apron. The section of Greenbag Road west of Giant Eagle is outside the scope of the current project.
570	All comments received by the WVDOH have been included and considered during the analysis and development of the project. The roundabouts were designed to accommodate AASHTO WB-62 truck configuration, which is an interstate semi-truck with a 62' wheel base between steer axle and last trailer axle, including a 48' trailer. Larger trucks can navigate the roundabout and use the internal truck apron. The diversion of traffic from downtown, including large trucks, is not within the scope of this project.
571	The West Virginia Division of Highways does not "steal" property. Any property needed for the project will be acquired under the Uniform Relocation Assistance and Real Property Acquisition Act (1970). The existing grade on Kingwood Pike requires stopping on a -6.5% grade at the traffic signal. The grade approaching the roundabout includes a flat grade of less than 2% at the roundabout. In most cases, the roundabout will not require approaching traffic to come to a full or immediate stop, and does not queue traffic on the steep grade as the existing traffic signal does.
572	This comment is noted.

573	The preliminary investigation and engineering traffic study has examined two build alternatives and three options for each of the major intersections. The intersection options that were evaluated and analyzed include turning lanes, traffic signals, and roundabouts. WVDOH requires intersection improvements to meet or exceed an overall intersection LOS C or better during the peak hours studied for design year improvements. The times of day (peak hours) selected to be studied followed WVDOH guidelines and is standard traffic engineering practice for determining future intersection improvements. At the intersection of Greenbag Road/Dorsey Avenue/Kingwood Pike the traffic analysis determined that the intersection would operate at failure (overall intersection LOS F) if existing intersection conditions and operations were to remain the same 30-years in the future (design year) without any improvements. Adding only left turn lanes on Greenbag Road at the Dorsey/Kingwood Pike intersection was evaluated during an initial round of traffic analysis because this option had been suggested by the MPO. The option included upgrading the signal lights to have a protected/permissive left turn phase. The analysis showed that this option would result in some intersection improvements but could not achieve LOS C or better for the overall intersection operation. The overall intersection would operate at an unacceptable LOS (LOS E). In addition, the left turn lane option would result in the eastbound Greenbag Road traffic queue to extend past the Bluegrass Village Driveway. The traffic analysis determined that with installation of a roundabout the overall intersection would operate at a LOS C, meeting WVDOH design year criteria.
574	The comment is noted.
575	The diversion of traffic from downtown is not within the scope of this project.

Larger trucks can navigate the roundabout and use the internal truck apron.
579	This comment is noted.
580	The WVDOH developed this project based on recommendations from the preliminary study that was completed by the MMMPO and documented in the Greenbag Road Corridor Study. The MMMPO had completed several previous studies evaluating various transportation plans for the Greenbag Road corridor, with the ultimate vision of transforming Greenbag Road into a safe, efficient, and attractive multimodal transportation facility. The Greenbag Road project is included in the Statewide Transportation Improvement Program available at: https://transportation.wv.gov/highways/Programming/STIP/Pages/default.aspx.
581	The MPO report was the basis for the start of the Greenbag Road project. Additional studies and analysis has been conducted to develop the alternatives. The preliminary investigation and engineering traffic study has examined two build alternatives and three options for each of the

	major intersections. The intersection options that were evaluated and analyzed include turning lanes, traffic signals, and roundabouts. WVDOH requires intersection improvements to meet or exceed an overall intersection LOS C or better during the peak hours studied for design year improvements. The times of day (peak hours) selected to be studied followed WVDOH guidelines and is standard traffic engineering practice for determining future intersection improvements. At the intersection of Greenbag Road/Dorsey Avenue/Kingwood Pike the traffic analysis determined that the intersection would operate at failure (overall intersection LOS F) if existing intersection conditions and operations were to remain the same 30-years in the future (design year) without any improvements. Adding only left turn lanes on Greenbag Road at the Dorsey/Kingwood Pike intersection was evaluated during an initial round of traffic analysis because this option had been suggested by the MPO. The option included upgrading the signal lights to have a protected/permissive left turn phase. The analysis showed that this option would result in some intersection improvements but could not achieve LOS C or better for the overall intersection operation. The overall intersection would operate at an unacceptable LOS (LOS E). In addition, the left turn lane option would result in the eastbound Greenbag Road traffic queue to extend past the Bluegrass Village Driveway. The traffic analysis determined that with installation of a roundabout the overall intersection would operate at a LOS C, meeting WVDOH design year criteria. At the intersection of Greenbag Road/Mississippi Avenue the traffic analysis determined that the intersection would operate at failure (overall intersection LOS F) if existing intersection conditions and operations were to remain the same 30-years in the future (design year) without any improvements. The design year with improvements scenarios evaluated determined that with installation of a roundabout the overall intersection would operate at a LOS A, best operating conditions, for all peak hours studied. Installation of a traffic signal with turn lanes resulted in an overall intersection LOS B during the AM peak hour, with the Mississippi Avenue approach operating at a LOS C. Though the analysis meets WVDOH minimum LOS criteria, the roundabout option exceeds WVDOH minimum LOS criteria. Roundabouts help reduce vehicular delay and promotes a continuous flow of traffic, which increases traffic capacity at an intersection.
582	The preliminary investigation and engineering traffic study has examined two build alternatives and three options for each of the major intersections. The intersection options that were evaluated and analyzed include turning lanes, traffic signals, and roundabouts. WVDOH requires intersection improvements to meet or exceed an overall intersection LOS C or better during the peak hours studied for design year improvements. 	The traffic analysis determined that with installation of a roundabout the overall intersection would operate at a LOS C, meeting WVDOH design year criteria. At the intersection of Greenbag Road/Mississippi Avenue the traffic analysis determined that the intersection would operate at failure (overall intersection LOS F) if existing intersection conditions and operations were to remain the same 30-years in the future (design year) without any improvements. The design year with improvements scenarios evaluated determined that with installation of a roundabout the overall intersection would operate at a LOS A, best operating conditions, for all peak hours studied. Installation of a traffic signal with turn lanes resulted in an overall intersection LOS B during the AM peak hour, with the Mississippi Avenue approach operating at a LOS C. Though the analysis meets WVDOH minimum LOS criteria, the roundabout option exceeds WVDOH minimum LOS criteria. Roundabouts help reduce vehicular delay and promotes a continuous flow of traffic, which increases traffic capacity at an intersection. In addition, roundabouts help reduce the likelihood and severity of collisions. Studies by the Federal Highway Administration (FHWA) have shown that roundabouts typically achieve reduction in overall collisions, injury collisions, fatality collisions, and pedestrian collisions. Reasons for these reductions due to the installation of a roundabout include: - Low travel speeds – Drivers must slow down and yield to traffic before entering a roundabout. The reduction in speeds results in a decrease in crash severity and injury. - No traffic light "to beat" – The design of a roundabout promotes a continuous circular flow of traffic. Because of this design, drivers will not have the incentive to speed up to "beat the light", like they may at a traditional intersection. - One way travel – The design of a roundabout directs drivers through gently designed curves into a one-way counterclockwise circular path. This design eliminates the possibilities for T-bone and head-on collisions. In addition, a conventional 4-way intersection has 32 points of vehicle conflict due to the different crossings and maneuvers through the intersection. A roundabout has 8 points of conflict, which all occur in the same direction, reducing crash severity and likelihood of injury. Lastly, long-term costs associated with roundabouts are significantly less than a traffic signal, since no electrical costs and no traffic signal maintenance costs are involved with a roundabout. The EA details costs associated with each alternative and intersection option and is available on the WVDOH website: https://transportation.wv.gov/highways/engineering/comment/closed/greenbagroadimprovementproject/Pages/default.aspx. Construction costs for Option F (the roundabout) are lower than constructions costs for the turn lane options.

Adding only left turn lanes on Greenbag Road at the Dorsey/Kingwood Pike intersection was evaluated during an initial round of traffic analysis because this option had been suggested by the MPO. The option included upgrading the signal lights to have a protected/permissive left turn phase. The analysis showed that this option would result in some intersection improvements but could not achieve LOS C or better for the overall intersection operation. The overall intersection would operate at an unacceptable LOS (LOS E). In addition, the left turn lane option would result in the eastbound Greenbag Road traffic queue to extend past the Bluegrass Village Driveway. The traffic analysis determined that with installation of a roundabout the overall intersection would operate at a LOS C, meeting WVDOH design year criteria. At the intersection of Greenbag Road/Mississippi Avenue the traffic analysis determined that the intersection would operate at failure (overall intersection LOS F) if existing intersection conditions and operations were to remain the same 30-years in the future (design year) without any improvements. The design year with improvements scenarios evaluated determined that with installation of a roundabout the overall intersection would operate at a LOS A, best operating conditions, for all peak hours studied. Installation of a traffic signal with turn lanes resulted in an overall intersection LOS B during the AM peak hour, with the Mississippi Avenue approach operating at a LOS C. Though the analysis meets WVDOH minimum LOS criteria, the roundabout option exceeds WVDOH minimum LOS criteria. Roundabouts help reduce vehicular delay and promotes a continuous flow of traffic, which increases traffic capacity at an intersection. The traffic control plan, which will outline the intended traffic detour tour, will continue to be revised during final design. It should be noted that Aaron's Creek Road will not be utilized as a signed detour. The anticipated plan intends to utilize the center of the Dorsey Avenue /Kingwood Pike roundabout as a temporary intersection with temporary traffic signals during construction. A short-term detour is proposed using Summers School Road while constructing the connection of the existing Kingwood Pike with the new portion. The preferred alternative is anticipated to require 1.5 to 2 construction seasons.

	Conscious Harvest Cooperative Community Garden, Joy and Hemp Universal LLC, and Mockingbird Hill Farms are located on private property and the property owner will be compensated for the sale of any land to the WVDOH during the right-of-way acquisition process. Impacts to this parcel have been minimized to the extent practicable. Approximately 1.56 acres (67,900 square feet) will be required from the parcel. Fair market value will be paid for all properties that require full or partial acquisition as a result of the project. When only part of the property is required, as is the case with this parcel, fair market value of the part taken will be paid, plus damages, if any, to the residue, less all benefits. West Virginia law defines "market value" as the price a willing buyer would pay a willing seller, neither acting under compulsion nor duress, both exercising prudence and intelligent judgment as to its value and familiar with the purpose for which the property is reasonably available. Fair market value will be determined by a competent, professional real estate appraiser after a thorough inspection of the property, a comparison with similar properties in the area that have been sold recently, a determination and consideration of its replacement cost and depreciation and consideration of the income-producing potential. All appraisal reports are office-reviewed, then rechecked in the field by experienced, qualified review appraisers for accuracy. Since the Division of Highways has adopted a firm price policy, the property owner will be offered the full amount of the approved appraisal. There will be no attempt to buy property at less than fair market value. This policy guarantees that all citizens of the state receive full value for the money expended for highway rights of way. Those who hold a valid property interest in the property that is acquired for the project will be compensated during the ROW acquisition phase.

590	This comment is noted.
591	Both the MMMPO corridor study and the 2018 traffic study determined that traffic flow through the corridor is controlled by the congestion at the major intersections in the corridor. The projected growth in the Morgantown area will continue to increase traffic and congestion at the

	intersections if improvements do not occur. To address the current issues of congestion and lack of safe pedestrian use of the area, the WVDOH has examined two build alternatives and three options for each of the major intersections. The intersection options that were evaluated and analyzed include turning lanes, traffic signals, and roundabouts. Designs for the intersection improvements have factored the topography, safety issues, constructability, and current land use to develop feasible alternatives. The evaluation and analysis of these intersection options indicate that the roundabout would provide the most improvement to traffic congestion, has the lowest estimated construction cost, and does not displace any residences. The analysis also factors the improvement to the level of service provided by the turn lane options and the roundabout option for both current conditions and design year 2048 predicted conditions. The turn lane options do not improve the level of service as much as the roundabout and the turn lanes at Dorsey Avenue/Kingwood Pike involve complete takes of 2 or 3 residences (depending on the turn lane option selected). Any property needed for the project will be acquired under the Uniform Relocation Assistance and Real Property Acquisition Act (1970) through negotiations with the landowners.
592	Both the MMMPO corridor study and the 2018 traffic study determined that traffic flow through the corridor is controlled by the congestion at the major intersections in the corridor. The projected growth in the Morgantown area will continue to increase traffic and congestion at the intersections if improvements do not occur. To address the current issues of congestion and lack of safe pedestrian use of the area, the WVDOH has examined two build alternatives and three options for each of the major intersections. The turn lane options do not improve the level of service as much as the roundabout and the turn lanes at Dorsey Avenue/Kingwood Pike involve complete takes of 2 or 3 residences (depending on the turn lane option selected).
593	Roundabouts help reduce the likelihood and severity of collisions. Studies by the Federal Highway Administration (FHWA) have shown that roundabouts typically achieve reduction in overall collisions, injury collisions, fatality collisions, and pedestrian collisions. Reasons for these reductions due to the installation of a roundabout include: - Low travel speeds – Drivers must slow down and yield to traffic before entering a roundabout. The reduction in speeds results in a decrease in crash severity and injury. - No traffic light “to beat” – The design of a roundabout promotes a continuous circular flow of traffic. Because of this design, drivers will not have the incentive to speed up to “beat the light”, like they may at a traditional intersection. - One way travel – The design of a roundabout directs drivers through gently designed curves into a one-way counterclockwise circular path. This design eliminates the possibilities for T-bone and head-on collisions.

	In addition, a conventional 4-way intersection has 32 points of vehicle conflict due to the different crossings and maneuvers through the intersection. A roundabout has 8 points of conflict, which all occur in the same direction, reducing crash severity and likelihood of injury. Lastly, long-term costs associated with roundabouts are significantly less than a traffic signal, since no electrical costs and no traffic signal maintenance costs are involved with a roundabout. The WVDOH has an educational video on how to use a roundabout available for viewing at https://www.youtube.com/watch?v=7njH4MKyo0w.
594	Both the MMMPO corridor study and the 2018 traffic study determined that traffic flow through the corridor is controlled by the congestion at the major intersections in the corridor. The projected growth in the Morgantown area will continue to increase traffic and congestion at the intersections if improvements do not occur. Road repair beyond the scope of this project is being addressed through the Governor's Roads to Prosperity program and progress can be tracked via the WVDOH website. Drainage issues will be addressed within the project area. The traffic control plan will continue to be revised during final design, and will not use Aaron's Creek Road as a signed detour. The revised plan intends to utilize the center of the Dorsey/Kingwood roundabout as a temporary intersection with temporary traffic signals. A short-term detour is proposed using Summers School Road while constructing the connection of the existing Kingwood Pike with the new portion.
595	Drainage issues within the project footprint will be considered by the project design to improve drainage conditions.
596	Impacts to wetlands have already been identified. The aquatic resources study and the EA are available on the WVDOH website at https://transportation.wv.gov/highways/engineering/comment/closed/greenbagroadimprovementproject/Pages/default.aspx. During the final design all drainage design will be finalized and any changes to wetland impacts will be identified and included in the mitigation plan.
597	The MMMPO had completed several previous studies evaluating various transportation plans for the Greenbag Road corridor, with the ultimate vision of transforming Greenbag Road into a safe, efficient, and attractive multimodal transportation facility. The scenarios determined to be evaluated in the traffic study evolved from the outcome of the MMMPO's preliminary studies and findings. Existing two-way stop controlled operations with potential roadway improvements were evaluated as part of the traffic, as well as traffic signal and roundabout options. The intersection of Greenbag Road/Dorsey Avenue/Kingwood Pike is currently controlled by a traffic signal and not by a four-way (all-way) stop, which includes stop sign control on each approach. The intersection would operate at failure (overall intersection LOS F) if existing intersection conditions and operations (traffic signal control) were to remain the same 30-years in the future (design year) without any improvements. Therefore, traffic analysis was not completed for a four-way (all-way) stop controlled intersection operations.

	Road repair beyond the scope of this project is being addressed through the Governor's Roads to Prosperity program and progress can be tracked via the WVDOH website.
598	The preliminary investigation and engineering traffic study has examined two build alternatives and three options for each of the major intersections. The intersection options that were evaluated and analyzed include turning lanes, traffic signals, and roundabouts. WVDOH requires intersection improvements to meet or exceed an overall intersection LOS C or better during the peak hours studied for design year improvements. The times of day (peak hours) selected to be studied followed WVDOH guidelines and is standard traffic engineering practice for determining future intersection improvements. At the intersection of Greenbag Road/Dorsey Avenue/Kingwood Pike the traffic analysis determined that the intersection would operate at failure (overall intersection LOS F) if existing intersection conditions and operations were to remain the same 30-years in the future (design year) without any improvements. Adding only left turn lanes on Greenbag Road at the Dorsey/Kingwood Pike intersection was evaluated during an initial round of traffic analysis because this option had been suggested by the MPO. The option included upgrading the signal lights to have a protected/permissive left turn phase. The analysis showed that this option would result in some intersection improvements but could not achieve LOS C or better for the overall intersection operation. The overall intersection would operate at an unacceptable LOS (LOS E). In addition, the left turn lane option would result in the eastbound Greenbag Road traffic queue to extend past the Bluegrass Village Driveway. The traffic analysis determined that with installation of a roundabout the overall intersection would operate at a LOS C, meeting WVDOH design year criteria. At the intersection of Greenbag Road/Mississippi Avenue the traffic analysis determined that the intersection would operate at failure (overall intersection LOS F) if existing intersection conditions and operations were to remain the same 30-years in the future (design year) without any improvements. The design year with improvements scenarios evaluated determined that with installation of a roundabout the overall intersection would operate at a LOS A, best operating conditions, for all peak hours studied. Installation of a traffic signal with turn lanes resulted in an overall intersection LOS B during the AM peak hour, with the Mississippi Avenue approach operating at a LOS C. Though the analysis meets WVDOH minimum LOS criteria, the roundabout option exceeds WVDOH minimum LOS criteria. Roundabouts help reduce vehicular delay and promotes a continuous flow of traffic, which increases traffic capacity at an intersection. Conscious Harvest Cooperative Community Garden, Joy and Hemp Universal LLC, and Mockingbird Hill Farms are located on private property and the property owner will be compensated for the sale of any land to the WVDOH during the right-of-way acquisition process. Impacts to this parcel have been minimized to the extent practicable. Approximately 1.56 acres (67,900 square feet) will be required from the parcel. Therefore, traffic analysis was not completed for a four-way (all-way) stop controlled intersection operations.
601	The MMMPO had completed several previous studies evaluating various transportation plans for the Greenbag Road corridor, with the ultimate vision of transforming Greenbag Road into a safe, efficient, and attractive multimodal transportation facility. The scenarios determined to be evaluated in the traffic study evolved from the outcome of the MMMPO's preliminary studies and findings. Existing two-way stop controlled operations with potential roadway improvements were evaluated as part of the traffic, as well as traffic signal and roundabout options.

	The intersection of Greenbag Road/Dorsey Avenue/Kingwood Pike is currently controlled by a traffic signal and not by a four-way (all-way) stop, which includes stop sign control on each approach. The intersection would operate at failure (overall intersection LOS F) if existing intersection conditions and operations (traffic signal control) were to remain the same 30-years in the future (design year) without any improvements. Therefore, traffic analysis was not completed for a four-way (all-way) stop controlled intersection operations.
602	The roundabouts were designed to accommodate AASHTO WB-62 truck configuration, which is an interstate semi-truck with a 62' wheel base between steer axle and last trailer axle, including a 48' trailer. Larger trucks can navigate the roundabout and use the internal truck apron.
603	The MMMPO had completed several previous studies evaluating various transportation plans for the Greenbag Road corridor, with the ultimate vision of transforming Greenbag Road into a safe, efficient, and attractive multimodal transportation facility. The scenarios determined to be evaluated in the traffic study evolved from the outcome of the MMMPO's preliminary studies and findings. Existing two-way stop controlled operations with potential roadway improvements were evaluated as part of the traffic, as well as traffic signal and roundabout options. The intersection of Greenbag Road/Dorsey Avenue/Kingwood Pike is currently controlled by a traffic signal and not by a four-way (all-way) stop, which includes stop sign control on each approach. The intersection would operate at failure (overall intersection LOS F) if existing intersection conditions and operations (traffic signal control) were to remain the same 30-years in the future (design year) without any improvements. Therefore, traffic analysis was not completed for a four-way (all-way) stop controlled intersection operations. Differences between Greenbag Road and the Mileground include the volume of traffic. Greenbag Road has less than half the traffic volume that Mileground has. A second major difference is the general configuration of the roundabouts. The proposed roundabouts on Greenbag are more straightforward and more traditional roundabout designs, without all of the confusing lanes that are present at Mileground. The roundabouts on Greenbag Road will be more intuitive for drivers. Every roundabout is designed and adapted to the context of its location.
604	Any property needed for the project will be acquired under the Uniform Relocation Assistance and Real Property Acquisition Act (1970) through negotiations with the landowners.
605	Conscious Harvest Cooperative Community Garden, Joy and Hemp Universal LLC, and Mockingbird Hill Farms are located on private property and the property owner will be compensated for the sale of any land to the WVDOH during the right-of-way acquisition process. Impacts to this parcel have been minimized to the extent practicable. Approximately 1.56 acres (67,900 square feet) will be required from the parcel. Fair market value will be paid for all properties that require full or partial acquisition as a result of the project. When only part of the property is required, as is the case with this parcel, fair market value of the part taken will be paid, plus damages, if any, to the residue, less all benefits. West Virginia law defines "market value" as the price a willing buyer would pay a willing seller, neither acting under compulsion nor duress, both exercising prudence and intelligent judgment as to its value and familiar with the purpose for which the property is reasonably available. Fair

	market value will be determined by a competent, professional real estate appraiser after a thorough inspection of the property, a comparison with similar properties in the area that have been sold recently, a determination and consideration of its replacement cost and depreciation and consideration of the income-producing potential. All appraisal reports are office-reviewed, then rechecked in the field by experienced, qualified review appraisers for accuracy. Since the Division of Highways has adopted a firm price policy, the property owner will be offered the full amount of the approved appraisal. There will be no attempt to buy property at less than fair market value. This policy guarantees that all citizens of the state receive full value for the money expended for highway rights of way. Those who hold a valid property interest in the property that is acquired for the project will be compensated during the ROW acquisition phase. Designs for the intersection improvements have factored the topography, safety issues, constructability, and current land use to develop feasible alternatives. Moving the intersection to the north into the former Atomic Grill location is not feasible given the topography and approach angles.
606	The existing grade on Kingwood Pike requires stopping on a -6.5% grade at the traffic signal. The grade approaching the roundabout includes a flat grade of less than 2% at the roundabout. In most cases, the roundabout will not require approaching traffic to come to a full or immediate stop, and does not queue traffic on the steep grade as the existing traffic signal does.
607	The roundabouts were designed to accommodate AASHTO WB-62 truck configuration, which is an interstate semi-truck with a 62' wheel base between steer axle and last trailer axle, including a 48' trailer. Larger trucks can navigate the roundabout and use the internal truck apron. Any property needed for the project will be acquired under the Uniform Relocation Assistance and Real Property Acquisition Act (1970) through negotiations with the landowners.
608	The EA reviewed multiple alternatives including turn lanes, traffic lights, and the roundabouts. Through the analysis in the EA, the only alternative that meets the purpose and need of the project is the roundabout. The turn lane options that were examined do not improve the level of service as much as the roundabout at the intersection of Dorsey Avenue/Kingwood Pike. In addition, the turn lane option involves complete takes of 2 residences and 1 business. These takes are different from what was reported in the EA. This change will be noted in the FONSI. Adding only left turn lanes on Greenbag Road at the Dorsey/Kingwood Pike intersection was evaluated during an initial round of traffic analysis because this option had been suggested by the MPO. The option included upgrading the signal lights to have a protected/permissive left turn phase. The analysis showed that this option would result in some intersection improvements but could not achieve LOS C or better for the overall intersection operation. It should be noted that LOS C is WVDOH's design year level of service criteria threshold for intersection improvements. The overall intersection would operate at an unacceptable level of service (LOS E). In addition, the left turn lane option would result in the eastbound Greenbag Road traffic queue to extend past the Bluegrass Village Driveway.

	Road repair beyond the scope of this project is being addressed through the Governor's Roads to Prosperity program and progress can be tracked via the WVDOH website
609	The traffic control plan will continue to be revised during final design, and will not use Aaron's Creek Road as a signed detour. The revised plan intends to utilize the center of the Dorsey/Kingwood roundabout as a temporary intersection with temporary traffic signals. A short-term detour is proposed using Summers School Road while constructing the connection of the existing Kingwood Pike with the new portion. There will be no attempt to buy property at less than fair market value. This policy guarantees that all citizens of the state receive full value for the money expended for highway rights of way. Those who hold a valid property interest in the property that is acquired for the project will be compensated during the ROW acquisition phase.
610	The preliminary investigation and engineering traffic study was completed to evaluate the Greenbag Road corridor, evaluating the existing and potential future operation of the intersections selected for study by WVDOH. The Greenbag Road corridor has long been recognized as a challenging roadway to navigate due to geometric deficiencies, significant intersection delays during the peak hours, and increased volume of truck traffic and development within the corridor. Several studies have been previously completed through the MMMPO, evaluating various transportation plans for the Greenbag Road corridor, with the ultimate vision of transforming Greenbag Road into a safe, efficient, and attractive multimodal transportation facility. It should be noted that the traffic evaluation was completed prior to the COVID-19 pandemic and its effects to traffic currently occurring.

611	The MMMPO had completed several previous studies evaluating various transportation plans for the Greenbag Road corridor, with the ultimate vision of transforming Greenbag Road into a safe, efficient, and attractive multimodal transportation facility. The scenarios determined to be evaluated in the traffic study evolved from the outcome of the MMMPO's preliminary studies and findings. Existing two-way stop controlled operations with potential roadway improvements were evaluated as part of the traffic study, as well as traffic signal and roundabout options. The option to add left turn lanes only on Greenbag Rd at the Dorsey/Kingwood Pike was one of the options suggested by the MMMPO study and was included on the first round of traffic analysis submitted to the WVDOH in February of 2019. This scenario also included upgrading the existing 2-phase traffic signal to 3-phases to incorporate a protected/permissive left turn phase. Installation of the turn lanes and modifying the signal phasing resulted in various approach and overall intersection LOS improvements; however, LOS C or better for the overall intersection operation could not be achieved. It was projected that some movements and the overall intersection would operate at an unacceptable level of service (LOS E or F). During the PM peak hour, the overall intersection is projected to operate at an overall intersection LOS E, and the eastbound through movement is forecasted to operate at a LOS F. This option would result in the Greenbag Road and Dorsey Avenue approaches queue lengths increasing. The eastbound Greenbag Road through movement queue will continue to extend past the Bluegrass Village driveway. Based on these findings and at the direction of the WVDOH, the traffic analysis was revised using additional options, which developed into Options D and E examined for the EA. The left turn lane only on Greenbag Road was not developed further and no impacts were assessed for the EA. The turn lane options that were examined in the EA do not improve the level of service as much as the roundabout and the turn lanes at Dorsey Avenue/Kingwood Pike involve complete takes of 2 residences and 1 business. These takes are different from what was reported in the EA. This change will be noted in the FONSI. Road repair beyond the scope of this project is being addressed through the Governor's Roads to Prosperity program and progress can be tracked via the WVDOH website.
612	The turn lane options that were examined do not improve the level of service as much as the roundabout at the intersection of Dorsey Avenue/Kingwood Pike. 617	Roundabouts are designed to maintain a constant flow of traffic through the intersection which results in reduced congestion on roadways and a reduction in delays for drivers. Studies have shown that changing signalized intersections to roundabouts can have up to an 89% average reduction in vehicle delays. The improved traffic flow also results in reduced vehicle emissions including carbon monoxide, nitrous oxide, and carbon dioxide at the intersection. Additionally, roundabouts are designed to slow speeds in the approach and through the roundabout allowing

	drivers more response time and limiting the number of potential directions where traffic could approach. Both of these factors improve safety for all drivers, including older drivers as well as pedestrians, and cyclists. Signage meeting WVDOH and the Federal Manual on Uniform Traffic Control Devices will be placed to assist drivers with navigating the roundabouts.
618	Roundabouts are designed to maintain a constant flow of traffic through the intersection which results in reduced congestion on roadways and a reduction in delays for drivers. Both of these factors improve safety for all drivers, including older drivers as well as pedestrians, and cyclists. Signage meeting WVDOH and the Federal Manual on Uniform Traffic Control Devices will be placed to assist drivers with navigating the roundabouts.
619	Roundabouts are designed to maintain a constant flow of traffic through the intersection which results in reduced congestion on roadways and a reduction in delays for drivers. Studies have shown that changing signalized intersections to roundabouts can have up to an 89% average reduction in vehicle delays. The improved traffic flow also results in reduced vehicle emissions including carbon monoxide, nitrous oxide, and carbon dioxide at the intersection. Additionally, roundabouts are designed to slow speeds in the approach and through the roundabout allowing drivers more response time and limiting the number of potential directions where traffic could approach. Both of these factors improve safety for all drivers, including older drivers as well as pedestrians, and cyclists. Signage meeting WVDOH and the Federal Manual on Uniform Traffic Control Devices will be placed to assist drivers with navigating the roundabouts.
620	Road repair beyond the scope of this project is being addressed through the Governor's Roads to Prosperity program and progress can be tracked via the WVDOH website.
621	Road repair beyond the scope of this project is being addressed through the Governor's Roads to Prosperity program and progress can be tracked via the WVDOH website.
622	The MMMPO had completed several previous studies evaluating various transportation plans for the Greenbag Road corridor, with the ultimate vision of transforming Greenbag Road into a safe, efficient, and attractive multimodal transportation facility. The scenarios determined to be evaluated in the traffic study evolved from the outcome of the MMMPO's preliminary studies and findings. Existing two-way stop controlled operations with potential roadway improvements were evaluated as part of the traffic study, as well as traffic signal and roundabout options.

623	The EA reviewed multiple alternatives including turn lanes, traffic lights, and the roundabouts. Through the analysis in the EA, the only alternative that meets the purpose and need of the project is the roundabout. The turn lane options that were examined do not improve the level of service as much as the roundabout at the intersection of Dorsey Avenue/Kingwood Pike. In addition, the turn lane option involves complete takes of 2 residences and 1 business. These takes are different from what was reported in the EA. This change will be noted in the FONSI. Adding only left turn lanes on Greenbag Road at the Dorsey/Kingwood Pike intersection was evaluated during an initial round of traffic analysis because this option had been suggested by the MPO. The option included upgrading the signal lights to have a protected/permissive left turn phase. The analysis showed that this option would result in some intersection improvements but could not achieve LOS C or better for the overall intersection operation. It should be noted that LOS C is WVDOH's design year level of service criteria threshold for intersection improvements. The overall intersection would operate at an unacceptable level of service (LOS E). In addition, the left turn lane option would result in the eastbound Greenbag Road traffic queue to extend past the Bluegrass Village Driveway. Conscious Harvest Cooperative Community Garden, Joy and Hemp Universal LLC, and Mockingbird Hill Farms are located on private property and the property owner will be compensated for the sale of any land to the WVDOH during the right-of-way acquisition process. Impacts to this parcel have been minimized to the extent practicable. Approximately 1.56 acres (67,900 square feet) will be required from the parcel. Fair market value will be paid for all properties that require full or partial acquisition as a result of the project. When only part of the property is required, as is the case with this parcel, fair market value of the part taken will be paid, plus damages, if any, to the residue, less all benefits. West Virginia law defines "market value" as the price a willing buyer would pay a willing seller, neither acting under compulsion nor duress, both exercising prudence and intelligent judgment as to its value and familiar with the purpose for which the property is reasonably available. Fair market value will be determined by a competent, professional real estate appraiser after a thorough inspection of the property, a comparison with similar properties in the area that have been sold recently, a determination and consideration of its replacement cost and depreciation and consideration of the income-producing potential. All appraisal reports are office-reviewed, then rechecked in the field by experienced, qualified review appraisers for accuracy. Since the Division of Highways has adopted a firm price policy, the property owner will be offered the full amount of the approved appraisal. There will be no attempt to buy property at less than fair market value. This policy guarantees that all citizens of the state receive full value for the money expended for highway rights of way. Those who hold a valid property interest in the property that is acquired for the project will be compensated during the ROW acquisition phase. Moving the intersection to the north into the former Atomic Grill location is not feasible given the topography and approach angles.

624	The preliminary investigation and engineering traffic study was completed to evaluate the Greenbag Road corridor, evaluating the existing and potential future operation of the intersections selected for study by WVDOH. The evaluation of existing roadway conditions, including the existing roadway conditions of Kingwood Pike, was not part of the preliminary investigation and engineering traffic study. The Greenbag Road corridor has long been recognized as a challenging roadway to navigate due to geometric deficiencies, significant intersection delays during the peak hours, and increased volume of truck traffic and development within the corridor. Several studies have been previously completed through the MMMPO, evaluating various transportation plans for the Greenbag Road corridor, with the ultimate vision of transforming Greenbag Road into a safe, efficient, and attractive multimodal transportation facility. It should be noted that the traffic evaluation was completed prior to the COVID-19 pandemic and its effects to traffic currently occurring. The EA reviewed multiple alternatives including turn lanes, traffic lights, and the roundabouts. Through the analysis in the EA, the only alternative that meets the purpose and need of the project is the roundabout.
625	The preliminary investigation and engineering traffic study was completed to evaluate the Greenbag Road corridor, evaluating the existing and potential future operation of the intersections selected for study by WVDOH. The evaluation of existing roadway conditions, including the existing roadway conditions of Kingwood Pike, was not part of the preliminary investigation and engineering traffic study. The Greenbag Road corridor has long been recognized as a challenging roadway to navigate due to geometric deficiencies, significant intersection delays during the peak hours, and increased volume of truck traffic and development within the corridor. Several studies have been previously completed through the MMMPO, evaluating various transportation plans for the Greenbag Road corridor, with the ultimate vision of transforming Greenbag Road into a safe, efficient, and attractive multimodal transportation facility. It should be noted that the traffic evaluation was completed prior to the COVID-19 pandemic and its effects to traffic currently occurring. The EA reviewed multiple alternatives including turn lanes, traffic lights, and the roundabouts. Through the analysis in the EA, the only alternative that meets the purpose and need of the project is the roundabout. Road repair beyond the scope of this project is being addressed through the Governor's Roads to Prosperity program and progress can be tracked via the WVDOH website.
626	The traffic control plan will continue to be revised during final design, and will not use Aaron’s Creek Road as a signed detour. The revised plan intends to utilize the center of the Dorsey/Kingwood roundabout as a temporary intersection with temporary traffic signals. A short-term detour is proposed using Summers School Road while constructing the connection of the existing Kingwood Pike with the new portion. The turn lane options that were examined do not improve the level of service as much as the roundabout at the intersection of Dorsey Avenue/Kingwood Pike. In addition, the turn lane option involves complete takes of 2 residences and 1 business. These takes are different from

	what was reported in the EA. This change will be noted in the FONSI. Adding only left turn lanes on Greenbag Road at the Dorsey/Kingwood Pike intersection was evaluated during an initial round of traffic analysis because this option had been suggested by the MPO. The option included upgrading the signal lights to have a protected/permissive left turn phase. The analysis showed that this option would result in some intersection improvements but could not achieve LOS C or better for the overall intersection operation. It should be noted that LOS C is WVDOH's design year level of service criteria threshold for intersection improvements. The overall intersection would operate at an unacceptable level of service (LOS E). In addition, the left turn lane option would result in the eastbound Greenbag Road traffic queue to extend past the Bluegrass Village Driveway. Moving the intersection to the north into the former Atomic Grill location is not feasible given the topography and approach angles.
627	The traffic control plan will continue to be revised during final design, and will not use Aaron's Creek Road as a signed detour. The revised plan intends to utilize the center of the Dorsey/Kingwood roundabout as a temporary intersection with temporary traffic signals. A short-term detour is proposed using Summers School Road while constructing the connection of the existing Kingwood Pike with the new portion. The turn lane options that were examined do not improve the level of service as much as the roundabout at the intersection of Dorsey Avenue/Kingwood Pike. In addition, the turn lane option involves complete takes of 2 residences and 1 business. These takes are different from what was reported in the EA. This change will be noted in the FONSI. Adding only left turn lanes on Greenbag Road at the Dorsey/Kingwood Pike intersection was evaluated during an initial round of traffic analysis because this option had been suggested by the MPO. The option included upgrading the signal lights to have a protected/permissive left turn phase. The analysis showed that this option would result in some intersection improvements but could not achieve LOS C or better for the overall intersection operation. It should be noted that LOS C is WVDOH's design year level of service criteria threshold for intersection improvements. The overall intersection would operate at an unacceptable level of service (LOS E). In addition, the left turn lane option would result in the eastbound Greenbag Road traffic queue to extend past the Bluegrass Village Driveway.
628	The traffic control plan will continue to be revised during final design, and will not use Aaron's Creek Road as a signed detour. The revised plan intends to utilize the center of the Dorsey/Kingwood roundabout as a temporary intersection with temporary traffic signals. A short-term detour is proposed using Summers School Road while constructing the connection of the existing Kingwood Pike with the new portion.
629	The MMMPO had completed several previous studies evaluating various transportation plans for the Greenbag Road corridor, with the ultimate vision of transforming Greenbag Road into a safe, efficient, and attractive multimodal transportation facility. The scenarios determined to be evaluated in the traffic study evolved from the outcome of the MMMPO's preliminary studies and findings. Existing two-way stop controlled operations with potential roadway improvements were evaluated as part of the traffic, as well as traffic signal and roundabout options.

	The intersection of Greenbag Road/Dorsey Avenue/Kingwood Pike is currently controlled by a traffic signal and not by a four-way (all-way) stop, which includes stop sign control on each approach. The intersection would operate at failure (overall intersection LOS F) if existing intersection conditions and operations (traffic signal control) were to remain the same 30-years in the future (design year) without any improvements. Therefore, traffic analysis was not completed for a four-way (all-way) stop controlled intersection operations. The EA reviewed multiple alternatives including turn lanes, traffic lights, and the roundabouts. Through the analysis in the EA, the only alternative that meets the purpose and need of the project is the roundabout.
630	Conscious Harvest Cooperative Community Garden, Joy and Hemp Universal LLC, and Mockingbird Hill Farms are located on private property and the property owner will be compensated for the sale of any land to the WVDOH during the right-of-way acquisition process. Impacts to this parcel have been minimized to the extent practicable. Approximately 1.56 acres (67,900 square feet) will be required from the parcel. Fair market value will be paid for all properties that require full or partial acquisition as a result of the project. When only part of the property is required, as is the case with this parcel, fair market value of the part taken will be paid, plus damages, if any, to the residue, less all benefits. West Virginia law defines "market value" as the price a willing buyer would pay a willing seller, neither acting under compulsion nor duress, both exercising prudence and intelligent judgment as to its value and familiar with the purpose for which the property is reasonably available. Fair market value will be determined by a competent, professional real estate appraiser after a thorough inspection of the property, a comparison with similar properties in the area that have been sold recently, a determination and consideration of its replacement cost and depreciation and consideration of the income-producing potential. All appraisal reports are office-reviewed, then rechecked in the field by experienced, qualified review appraisers for accuracy. Since the Division of Highways has adopted a firm price policy, the property owner will be offered the full amount of the approved appraisal. There will be no attempt to buy property at less than fair market value. This policy guarantees that all citizens of the state receive full value for the money expended for highway rights of way. Those who hold a valid property interest in the property that is acquired for the project will be compensated during the ROW acquisition phase.
631	We appreciate your input regarding the project.
632	The Greenbag Road roundabouts have major differences to other existing roundabouts within Morgantown, including the Mileground. Greenbag Road has less than half the traffic volume of the Mileground. A second major difference is the general configuration of the roundabouts. The proposed roundabouts on Greenbag are more straightforward and more traditional roundabout designs, without all of the confusing lanes that are present at Mileground. The roundabouts on Greenbag Road will be more intuitive for drivers. Every roundabout is designed and adapted to the context of its location.

	The future traffic along Greenbag Road, Mississippi Avenue, Dorsey Avenue, Kingwood Pike were projected for the future design year by assuming existing traffic distribution/patterns but with increased traffic volumes though application of a yearly traffic growth rate of 1.16% per year. The EA reviewed multiple alternatives including turn lanes, traffic lights, and the roundabouts. The analysis included consideration for future traffic volumes. Through the analysis in the EA, the only alternative that meets the purpose and need of the project is the roundabout.
633	Roundabouts help reduce vehicular delay and promotes a continuous flow of traffic, which increases traffic capacity at an intersection. Traffic entering a roundabout on each approach does not need to have the same volume of traffic in order to function optimally. Each roundabout is designed and adapted to the context of its location. Conscious Harvest Cooperative Community Garden, Joy and Hemp Universal LLC, and Mockingbird Hill Farms are located on private property and the property owner will be compensated for the sale of any land to the WVDOH during the right-of-way acquisition process. Impacts to this parcel have been minimized to the extent practicable. Approximately 1.56 acres (67,900 square feet) will be required from the parcel. Fair market value will be paid for all properties that require full or partial acquisition as a result of the project. When only part of the property is required, as is the case with this parcel, fair market value of the part taken will be paid, plus damages, if any, to the residue, less all benefits. West Virginia law defines “market value” as the price a willing buyer would pay a willing seller, neither acting under compulsion nor duress, both exercising prudence and intelligent judgment as to its value and familiar with the purpose for which the property is reasonably available. Fair market value will be determined by a competent, professional real estate appraiser after a thorough inspection of the property, a comparison with similar properties in the area that have been sold recently, a determination and consideration of its replacement cost and depreciation and consideration of the income-producing potential. All appraisal reports are office-reviewed, then rechecked in the field by experienced, qualified review appraisers for accuracy. Since the Division of Highways has adopted a firm price policy, the property owner will be offered the full amount of the approved appraisal. There will be no attempt to buy property at less than fair market value. This policy guarantees that all citizens of the state receive full value for the money expended for highway rights of way. Those who hold a valid property interest in the property that is acquired for the project will be compensated during the ROW acquisition phase.
634	The sidewalk design has been extended from the western end of the project area along Greenbag Road to the Dorsey Avenue/Kingwood Pike intersection. At the intersection the sidewalk follows Dorsey Avenue north to Luckey Lane and east on Luckey Lane to the connection with the existing sidewalk at Mountainview Elementary School. The shoulder along the north side of Greenbag Road is being designed to accommodate bicycle use by being wider (3 feet) than the standard shoulder (2 feet). Extensions beyond the scope of this project can be considered during future planning.

635	The public comment period was extended to November 30, 2020. The cultural resources surveys were conducted according to the guidelines published by the WV State Historic Preservation Office. The archaeological survey included the excavation of 213 shovel test pits, one test excavation unit, and visual inspection of the entire surface area within the defined area of potential effect. As the reviewing agency, the WV SHPO concurred with the recommendation that no further archaeological investigations were warranted and no archaeological historic properties are present in the study area. The historic structures survey resulted in the identification of 25 structures 45+ years old within the defined area of potential effect. Two of the resources were recommended eligible for the National Register of Historic Places and the project was designed to avoid potential impacts to these properties. As the reviewing agency, the WV SHPO concurred with the recommendation that the project would not adversely affect any NRHP eligible resources and that no further historic structures investigations were needed. The cultural resources reports are available as an Appendix to the EA on the WVDOH website at https://transportation.wv.gov/highways/engineering/comment/closed/greenbagroadimprovementproject/Pages/default.aspx
636	A shared-use path was part of some early versions of the project, but the right of way impacts along Bluegrass Village and the Kennedy Center were significant. Due to these detrimental impacts the shared use path was removed from the alternatives that were advanced to the EA. The sidewalk design has been extended from the western end of the project area along Greenbag Road to the Dorsey Avenue/Kingwood Pike intersection. At the intersection the sidewalk follows Dorsey Avenue north to Luckey Lane and east on Luckey Lane to the connection with the existing sidewalk at Mountainview Elementary School. The shoulder along the north side of Greenbag Road is being designed to accommodate bicycle use by being wider (3 feet) than the standard shoulder (2 feet). Extensions beyond the scope of this project can be considered during future planning. Moving the roundabout to the north into the former Atomic Grill location is not feasible given the topography and approach angles. The existing grade on Kingwood Pike requires stopping on a -6.5% grade at the traffic signal. The grade approaching the roundabout includes a flat grade of less than 2% at the roundabout. In the existing condition, the angle between Greenbag Road and Dorsey Avenue is 60° and in the proposed condition it is 74°, with closer to 90° being ideal. Conscious Harvest Cooperative Community Garden, Joy and Hemp Universal LLC, and Mockingbird Hill Farms are located on private property and the property owner will be compensated for the sale of any land to the WVDOH during the right-of-way acquisition process. Impacts to this parcel have been minimized to the extent practicable. Approximately 1.56 acres (67,900 square feet) will be required from the parcel. Fair market value will be paid for all properties that require full or partial acquisition as a result of the project. When only part of the property is required, as is the case with this parcel, fair market value of the part taken will be paid, plus damages, if any, to the residue, less all benefits. West Virginia law defines “market value” as the price a willing buyer would pay a willing seller, neither acting under compulsion nor duress, both exercising prudence and intelligent judgment as to its value and familiar with the purpose for which the property is reasonably available. Fair market value will be determined by a competent, professional real estate appraiser after a thorough inspection of the property, a comparison

	with similar properties in the area that have been sold recently, a determination and consideration of its replacement cost and depreciation and consideration of the income-producing potential. All appraisal reports are office-reviewed, then rechecked in the field by experienced, qualified review appraisers for accuracy. Since the Division of Highways has adopted a firm price policy, the property owner will be offered the full amount of the approved appraisal. There will be no attempt to buy property at less than fair market value. This policy guarantees that all citizens of the state receive full value for the money expended for highway rights of way. Those who hold a valid property interest in the property that is acquired for the project will be compensated during the ROW acquisition phase.
637	The option proposed here was one of the options suggested by the MMMPO study (adding left turn lanes only on Greenbag Rd at the Dorsey/Kingwood Pike) and was included on the first round of traffic analysis submitted to the WVDOH in February of 2019. This scenario also included upgrading the existing 2-phase traffic signal to 3-phases to incorporate a protected/permissive left turn phase. Installation of the turn lanes and modifying the signal phasing resulted in various approach and overall intersection LOS improvements; however, LOS C or better for the overall intersection operation could not be achieved. It was projected that some movements and the overall intersection would operate at an unacceptable level of service (LOS E or F). During the PM peak hour, the overall intersection is projected to operate at an overall intersection LOS E, and the eastbound through movement is forecasted to operate at a LOS F. This option would result in the Greenbag Road and Dorsey Avenue approaches queue lengths increasing. The eastbound Greenbag Road through movement queue will continue to extend past the Bluegrass Village driveway. Based on these findings and at the direction of the WVDOH, the traffic analysis was revised using additional options, which developed into Options D and E examined for the EA. The left turn lane only on Greenbag Road was not developed further and no impacts were assessed for the EA. During final design, further avoidance and/or minimization measures will be considered and/or implemented as appropriate to reduce the total impacts to streams. Specific Best Management Practices will be developed prior to construction to reduce the amount of disturbed aquatic habitat and riparian vegetation; minimize opportunities for increased sedimentation during construction; revegetate all disturbed areas to prevent accelerated erosion; designate equipment fueling and service areas away from aquatic habitats; and designate and construct all stormwater management facilities to prevent runoff. Coordination with resource agencies will continue throughout construction activities as necessary. The stormwater management plan for this project will meet the volume and rate requirements of the Morgantown Utility Board and WVDOH policies. Due to the existing topography and features it is likely that these requirements will require basins and other stormwater BMP's, such as vegetated swales. The amount of offsite runoff to the streams and wetlands will be minimized where practicable in order to limit basin size and meet the design criteria. Stormwater design for the project will be completed during final design and will minimize the impacts to the streams and wetlands located within and adjacent to the project right of way.

	The EA reported impacts to Federal Farmland Protection Policy Act (FPPA) soils. The entire Greenbag Road environmental study area is encompassed by "land already in or committed to urban development" as defined by the FPPA (see 7 CFR § 658.2 - Definitions) and is therefore not subject to provisions of FPPA. Please refer to the Farmland Appendix attached to the FONSI for further detail. Conscious Harvest Cooperative Community Garden, Joy and Hemp Universal LLC, and Mockingbird Hill Farms are located on private property and the property owner will be compensated for the sale of any land to the WVDOH during the right-of-way acquisition process. Impacts to this parcel have been minimized to the extent practicable. Approximately 1.56 acres (67,900 square feet) will be required from the parcel. Fair market value will be paid for all properties that require full or partial acquisition as a result of the project. When only part of the property is required, as is the case with this parcel, fair market value of the part taken will be paid, plus damages, if any, to the residue, less all benefits. West Virginia law defines "market value" as the price a willing buyer would pay a willing seller, neither acting under compulsion nor duress, both exercising prudence and intelligent judgment as to its value and familiar with the purpose for which the property is reasonably available. Fair market value will be determined by a competent, professional real estate appraiser after a thorough inspection of the property, a comparison with similar properties in the area that have been sold recently, a determination and consideration of its replacement cost and depreciation and consideration of the income-producing potential. All appraisal reports are office-reviewed, then rechecked in the field by experienced, qualified review appraisers for accuracy. Since the Division of Highways has adopted a firm price policy, the property owner will be offered the full amount of the approved appraisal. There will be no attempt to buy property at less than fair market value. This policy guarantees that all citizens of the state receive full value for the money expended for highway rights of way. Those who hold a valid property interest in the property that is acquired for the project will be compensated during the ROW acquisition phase. The cultural resources surveys were conducted according to the guidelines published by the WV State Historic Preservation Office. The archaeological survey included the excavation of 213 shovel test pits, one test excavation unit, and visual inspection of the entire surface area within the defined area of potential effect. Based on the SHPO guidelines, when no cultural resources are identified during the Phase I survey, an abbreviated technical report is acceptable. As the reviewing agency, the WV SHPO concurred with the recommendation that no further archaeological investigations were warranted and no archaeological historic properties are present in the study area. The historic structures survey resulted in the identification of 25 structures 45+ years old within the defined area of potential effect. Two of the resources were recommended eligible for the National Register of Historic Places and the project was designed to avoid potential impacts to these properties. As the reviewing agency, the WV SHPO concurred with the recommendation that the project would not adversely affect any NRHP eligible resources and that no further historic structures investigations were needed. The cultural resources reports are available as an Appendix to the EA on the WVDOH website at https://transportation.wv.gov/highways/engineering/comment/closed/greenbagroadimprovementproject/Pages/default.aspx.

	In regards to cost, since the traffic analysis determined that left turn lanes on Greenbag Road did not meet WVDOH's LOS criteria, a cost estimate was not prepared. However, long-term costs associated with roundabouts are significantly less than a traffic signal, since no electrical costs and no traffic signal maintenance are involved with a roundabout.
638	The preliminary investigation and engineering traffic study was completed to evaluate the Greenbag Road corridor, evaluating the existing and potential future operation of the intersections selected for study by WVDOH. The Greenbag Road corridor has long been recognized as a challenging roadway to navigate due to geometric deficiencies, significant intersection delays during the peak hours, and increased volume of truck traffic and development within the corridor. Several studies have been previously completed through the MMMPO, evaluating various transportation plans for the Greenbag Road corridor, with the ultimate vision of transforming Greenbag Road into a safe, efficient, and attractive multimodal transportation facility. It should be noted that the traffic evaluation was completed prior to the COVID-19 pandemic and its effects to traffic currently occurring. Long-term costs associated with roundabouts are significantly less than a traffic signal, since no electrical costs and no traffic signal maintenance are involved with a roundabout. The traffic control plan, which will outline the intended traffic detour tour, will continue to be revised during final design. It should be noted that Aaron's Creek Road will not be utilized as a signed detour. The anticipated plan intends to utilize the center of the Dorsey Avenue /Kingwood Pike roundabout as a temporary intersection with temporary traffic signals during construction. A short-term detour is proposed using Summers School Road while constructing the connection of the existing Kingwood Pike with the new portion.
639	Pedestrians should use the dedicated crosswalks when safely crossing, just like crossing any other intersection. At a roundabout, pedestrian crosswalks will be placed to cross each roadway leg to the roundabout, which is the same as traditional intersection crossings. The roundabout pedestrian crosswalk placement allows pedestrians to cross one direction of traffic a time at each roundabout approach because of the splitter island. Pedestrians should also use the designated crosswalk locations. Crossing to the center of the roundabout is not recommended.
640	The WVDOH will examine all safety concerns including crossings of Greenbag Road as part of the final design. Extensions beyond the scope of this project can be considered during future planning. Thank you for enumerating the safety concerns and the proposed HAWK beacon. The WVDOH will examine all safety concerns as part of the final design.
641	The WVDOH will examine all safety concerns including crossings of Greenbag Road as part of the final design. Further connections of existing trails is beyond the scope of the current project.

642	One of the major differences between Greenbag Road and the Mileground, is the volume of traffic. Greenbag Road has less than half the traffic volume that Mileground has. A second major difference is the general configuration of the roundabouts. The proposed roundabouts on Greenbag are more straightforward and more traditional roundabout designs, without all of the confusing lanes that are present at Mileground. The roundabouts on Greenbag Road will be more intuitive for drivers. Roundabouts are designed to slow speeds in the approach and through the roundabout allowing drivers more response time and limiting the number of potential directions where traffic could approach. Both of these factors improve safety for all drivers, including older drivers as well as pedestrians, and cyclists. Pedestrians should use the dedicated crosswalks when safely crossing, just like crossing any other intersection. At a roundabout, pedestrian crosswalks will be placed to cross each roadway leg to the roundabout, which is the same as traditional intersection crossings. The roundabout pedestrian crosswalk placement allows pedestrians to cross one direction of traffic a time at each roundabout approach because of the splitter island.
643	Operations along Don Knotts Boulevard/Route 119 is not included in the scope of the current project. The WVDOH will examine all safety concerns including crossings of Greenbag Road as part of the final design. Extensions beyond the scope of this project can be considered during future planning.
644	Both the MMMPO corridor study and the 2018 traffic study determined that traffic flow through the corridor is controlled by the congestion at the major intersections in the corridor. The projected growth in the Morgantown area will continue to increase traffic and congestion at the intersections if improvements do not occur. The turn lane options that were examined do not improve the level of service as much as the roundabout at the intersection of Dorsey Avenue/Kingwood Pike. In addition, the turn lane option involves complete takes of 2 residences and 1 business. These takes are different from what was reported in the EA. This change will be noted in the FONSI. Adding only left turn lanes on Greenbag Road at the Dorsey/Kingwood Pike intersection was evaluated during an initial round of traffic analysis because this option had been suggested by the MPO. The option included upgrading the signal lights to have a protected/permissive left turn phase. The analysis showed that this option would result in some intersection improvements but could not achieve LOS C or better for the overall intersection operation. It should be noted that LOS C is WVDOH's design year level of service criteria threshold for intersection improvements. The overall intersection would operate at an unacceptable level of service (LOS E). In addition, the left turn lane option would result in the eastbound Greenbag Road traffic queue to extend past the Bluegrass Village Driveway. Any property needed for the project will be acquired under the Uniform Relocation Assistance and Real Property Acquisition Act (1970) through negotiations with the landowners.
645	We appreciate your input regarding the project.

646	The preliminary investigation and engineering traffic study was completed to evaluate the Greenbag Road corridor, evaluating the existing and potential future operation of the intersections selected for study by WVDOH. The Greenbag Road corridor has long been recognized as a challenging roadway to navigate due to geometric deficiencies, significant intersection delays during the peak hours, and increased volume of truck traffic and development within the corridor. Several studies have been previously completed through the MMMPO, evaluating various transportation plans for the Greenbag Road corridor, with the ultimate vision of transforming Greenbag Road into a safe, efficient, and attractive multimodal transportation facility. It should be noted that the traffic evaluation was completed prior to the COVID-19 pandemic and its effects to traffic currently occurring. The turn lane option proposed here was one of the options suggested by the MMMPO study (adding left turn lanes only on Greenbag Rd at the Dorsey/Kingwood Pike) and was included on the first round of traffic analysis submitted to the WVDOH in February of 2019. This scenario also included upgrading the existing 2-phase traffic signal to 3-phases to incorporate a protected/permissive left turn phase. Installation of the turn lanes and modifying the signal phasing resulted in various approach and overall intersection LOS improvements; however, LOS C or better for the overall intersection operation could not be achieved. It was projected that some movements and the overall intersection would operate at an unacceptable level of service (LOS E or F). During the PM peak hour, the overall intersection is projected to operate at an overall intersection LOS E, and the eastbound through movement is forecasted to operate at a LOS F. This option would result in the Greenbag Road and Dorsey Avenue approaches queue lengths increasing. The eastbound Greenbag Road through movement queue will continue to extend past the Bluegrass Village driveway. Based on these findings and at the direction of the WVDOH, the traffic analysis was revised using additional options, which developed into Options D and E examined for the EA. The left turn lane only on Greenbag Road was not developed further and no impacts were assessed for the EA.
647	Conscious Harvest Cooperative Community Garden, Joy and Hemp Universal LLC, and Mockingbird Hill Farms are located on private property and the property owner will be compensated for the sale of any land to the WVDOH during the right-of-way acquisition process. Impacts to this parcel have been minimized to the extent practicable. Approximately 1.56 acres (67,900 square feet) will be required from the parcel. Fair market value will be paid for all properties that require full or partial acquisition as a result of the project. When only part of the property is required, as is the case with this parcel, fair market value of the part taken will be paid, plus damages, if any, to the residue, less all benefits. West Virginia law defines “market value” as the price a willing buyer would pay a willing seller, neither acting under compulsion nor duress, both exercising prudence and intelligent judgment as to its value and familiar with the purpose for which the property is reasonably available. Fair market value will be determined by a competent, professional real estate appraiser after a thorough inspection of the property, a comparison with similar properties in the area that have been sold recently, a determination and consideration of its replacement cost and depreciation and consideration of the income-producing potential. All appraisal reports are office-reviewed, then rechecked in the field by experienced, qualified review appraisers for accuracy. Since the Division of Highways has adopted a firm price policy, the property owner will be offered the full

	amount of the approved appraisal. There will be no attempt to buy property at less than fair market value. This policy guarantees that all citizens of the state receive full value for the money expended for highway rights of way. Those who hold a valid property interest in the property that is acquired for the project will be compensated during the ROW acquisition phase. Suncrest is outside the scope of the current project. Road repair beyond the scope of this project is being addressed through the Governor's Roads to Prosperity program and progress can be tracked via the WVDOH website.
648	Both the MMMPO corridor study and the 2018 traffic study determined that traffic flow through the corridor is controlled by the congestion at the major intersections in the corridor. The projected growth in the Morgantown area will continue to increase traffic and congestion at the intersections if improvements do not occur. The EA reviewed multiple alternatives including turn lanes, traffic lights, and the roundabouts. Through the analysis in the EA, the only alternative that meets the purpose and need of the project is the roundabout. At the intersection of Greenbag Road/Dorsey Avenue/Kingwood Pike the traffic analysis determined that the intersection would operate at failure (overall intersection LOS F) if existing intersection conditions and operations were to remain the same 30-years in the future (design year) without any improvements. Adding only left turn lanes on Greenbag Road at the Dorsey/Kingwood Pike intersection was evaluated during an initial round of traffic analysis because this option had been suggested by the MPO. The option included upgrading the signal lights to have a protected/permissive left turn phase. The analysis showed that this option would result in some intersection improvements but could not achieve LOS C or better for the overall intersection operation. The overall intersection would operate at an unacceptable LOS (LOS E). In addition, the left turn lane option would result in the eastbound Greenbag Road traffic queue to extend past the Bluegrass Village Driveway. The traffic analysis determined that with installation of a roundabout the overall intersection would operate at a LOS C, meeting WVDOH design year criteria. The project will meet all Clean Water Act and US Army Corps of Engineers requirements to minimize or mitigate for impacts to waterways. Drainage issues within the project footprint will be addressed by the project design, and further avoidance and/or minimization measures will be considered and/or implemented as appropriate to reduce the total impacts to streams. Specific Best Management Practices will be developed prior to construction to reduce the amount of disturbed aquatic habitat and riparian vegetation; minimize opportunities for increased sedimentation during construction; revegetate all disturbed areas to prevent accelerated erosion; designate equipment fueling and service areas away from aquatic habitats; and designate and construct all stormwater management facilities to prevent runoff. Coordination with resource agencies will continue throughout construction activities as necessary. The stormwater management plan for this project will meet the volume and rate requirements of the Morgantown Utility Board and WVDOH policies. Due to the existing topography and features it is likely that these requirements will require basins and other stormwater BMP's, such as

	vegetated swales. The amount of offsite runoff to the streams and wetlands will be minimized where practicable in order to limit basin size and meet the design criteria. Stormwater design for the project will be completed during final design and will minimize the impacts to the streams and wetlands located within and adjacent to the project right of way.
649	The cultural resources surveys were conducted according to the guidelines published by the WV State Historic Preservation Office. The historic structures survey resulted in the identification of 25 structures 45+ years old within the defined area of potential effect. Two of the resources were recommended eligible for the National Register of Historic Places and the project was designed to avoid potential impacts to these properties. As the reviewing agency, the WV SHPO concurred with the recommendation that the project would not adversely affect any NRHP eligible resources and that no further historic structures investigations were needed. More information is available in the EA appendices. The EA and appendices are available on the WVDOH website: https://transportation.wv.gov/highways/engineering/comment/closed/greenbagroadimprovementproject/Pages/default.aspx. Both the MMMPO corridor study and the 2018 traffic study determined that traffic flow through the corridor is controlled by the congestion at the major intersections in the corridor. The projected growth in the Morgantown area will continue to increase traffic and congestion at the intersections if improvements do not occur. Multiple options, including a no-build option, were considered during the initial traffic study and the preliminary design phase. The intersection options that were evaluated and analyzed include turning lanes, traffic signals, and roundabouts. The options included in the EA analysis met the purpose and need for the project in a feasible manner. WVDOH requires intersection improvements to meet or exceed an overall intersection LOS C or better during the peak hours studied for design year improvements. The times of day (peak hours) selected to be studied followed WVDOH guidelines and is standard traffic engineering practice for determining future intersection improvements. At the intersection of Greenbag Road/Dorsey Avenue/Kingwood Pike the traffic analysis determined that the intersection would operate at failure (overall intersection LOS F) if existing intersection conditions and operations were to remain the same 30-years in the future (design year) without any improvements. Adding only left turn lanes on Greenbag Road at the Dorsey/Kingwood Pike intersection was evaluated during an initial round of traffic analysis because this option had been suggested by the MPO. The option included upgrading the signal lights to have a protected/permissive left turn phase. The analysis showed that this option would result in some intersection improvements but could not achieve LOS C or better for the overall intersection operation. The overall intersection would operate at an unacceptable LOS (LOS E). In addition, the left turn lane option would result in the eastbound Greenbag Road traffic queue to extend past the Bluegrass Village Driveway. The traffic analysis determined that with installation of a roundabout the overall intersection would operate at a LOS C, meeting WVDOH design year criteria.

	Conscious Harvest Cooperative Community Garden, Joy and Hemp Universal LLC, and Mockingbird Hill Farms are located on private property and the property owner will be compensated for the sale of any land to the WVDOH during the right-of-way acquisition process. Impacts to this parcel have been minimized to the extent practicable. Approximately 1.56 acres (67,900 square feet) will be required from the parcel. Fair market value will be paid for all properties that require full or partial acquisition as a result of the project. When only part of the property is required, as is the case with this parcel, fair market value of the part taken will be paid, plus damages, if any, to the residue, less all benefits. West Virginia law defines "market value" as the price a willing buyer would pay a willing seller, neither acting under compulsion nor duress, both exercising prudence and intelligent judgment as to its value and familiar with the purpose for which the property is reasonably available. Fair market value will be determined by a competent, professional real estate appraiser after a thorough inspection of the property, a comparison with similar properties in the area that have been sold recently, a determination and consideration of its replacement cost and depreciation and consideration of the income-producing potential. All appraisal reports are office-reviewed, then rechecked in the field by experienced, qualified review appraisers for accuracy. Since the Division of Highways has adopted a firm price policy, the property owner will be offered the full amount of the approved appraisal. There will be no attempt to buy property at less than fair market value. This policy guarantees that all citizens of the state receive full value for the money expended for highway rights of way. Those who hold a valid property interest in the property that is acquired for the project will be compensated during the ROW acquisition phase.
650	Both the MMMPO corridor study and the 2018 traffic study determined that traffic flow through the corridor is controlled by the congestion at the major intersections in the corridor. Projected growth in the Morgantown area will continue to increase traffic and congestion at the intersections if improvements do not occur. To address the current issues of congestion and lack of safe pedestrian use of the area, the WVDOH has examined two build alternatives and three options for each of the major intersections. The intersection options that were evaluated and analyzed include turning lanes, traffic signals, and roundabouts. The turn lane options that were examined do not improve the level of service as much as the roundabout and the turn lanes at Dorsey Avenue/Kingwood Pike involve complete takes of 2 residences and 1 business. These takes are different from what was reported in the EA. This change will be noted in the FONSI. Adding only left turn lanes on Greenbag Road at the Dorsey/Kingwood Pike intersection was evaluated during an initial round of traffic analysis because this option had been suggested by the MPO. The option included upgrading the signal lights to have a protected/permissive left turn phase. The analysis showed that this option would result in some intersection improvements but could not achieve LOS C or better for the overall intersection operation. The overall intersection would operate at an unacceptable LOS (LOS E or F). The eastbound Greenbag Road traffic queue would extend past the Bluegrass Village Driveway. Based on these findings this option was replaced with Options D and E for the EA analysis.

	The intersection of Greenbag Road/Dorsey Avenue/Kingwood Pike is currently controlled by a traffic signal and not by a four-way (all-way) stop, which includes stop sign control on each approach. The intersection would operate at failure (overall intersection LOS F) if existing intersection conditions and operations (traffic signal control) were to remain the same 30-years in the future (design year) without any improvements. Therefore, traffic analysis was not completed for a four-way (all-way) stop controlled intersection operations
651	The EA reported impacts to Federal Farmland Protection Policy Act (FPPA) soils. The entire Greenbag Road environmental study area is encompassed by "land already in or committed to urban development" as defined by the FPPA (see 7 CFR § 658.2 - Definitions) and is therefore not subject to provisions of FPPA. Please refer to the Farmland Appendix attached to the FONSI for further detail. Conscious Harvest Cooperative Community Garden, Joy and Hemp Universal LLC, and Mockingbird Hill Farms are located on private property and the property owner will be compensated for the sale of any land to the WVDOH during the right-of-way acquisition process. Impacts to this parcel have been minimized to the extent practicable. Approximately 1.56 acres (67,900 square feet) will be required from the parcel. Fair market value will be paid for all properties that require full or partial acquisition as a result of the project. When only part of the property is required, as is the case with this parcel, fair market value of the part taken will be paid, plus damages, if any, to the residue, less all benefits. West Virginia law defines "market value" as the price a willing buyer would pay a willing seller, neither acting under compulsion nor duress, both exercising prudence and intelligent judgment as to its value and familiar with the purpose for which the property is reasonably available. Fair market value will be determined by a competent, professional real estate appraiser after a thorough inspection of the property, a comparison with similar properties in the area that have been sold recently, a determination and consideration of its replacement cost and depreciation and consideration of the income-producing potential. All appraisal reports are office-reviewed, then rechecked in the field by experienced, qualified review appraisers for accuracy. Since the Division of Highways has adopted a firm price policy, the property owner will be offered the full amount of the approved appraisal. There will be no attempt to buy property at less than fair market value. This policy guarantees that all citizens of the state receive full value for the money expended for highway rights of way. Those who hold a valid property interest in the property that is acquired for the project will be compensated during the ROW acquisition phase. More information is available in the FONSI and EA appendices. The EA and appendices are available on the WVDOH website: https://transportation.wv.gov/highways/engineering/comment/closed/greenbagroadimprovementproject/Pages/default.aspx.
652	The comment is noted.
653	The WVDOH will examine all safety concerns including crossings of Greenbag Road as part of the final design. Extensions beyond the scope of this project can be considered during future planning.

654	The WVDOH will examine all safety concerns including crossings of Greenbag Road as part of the final design.
655	The WVDOH will examine all safety concerns including crossings of Greenbag Road as part of the final design. Extensions beyond the scope of this project can be considered during future planning.
656	The preliminary investigation and engineering traffic study has examined two build alternatives and three options for each of the major intersections. The intersection options that were evaluated and analyzed include turning lanes, traffic signals, and roundabouts. WVDOH requires intersection improvements to meet or exceed an overall intersection LOS C or better during the peak hours studied for design year improvements. The times of day (peak hours) selected to be studied followed WVDOH guidelines and is standard traffic engineering practice for determining future intersection improvements. At the intersection of Greenbag Road/Dorsey Avenue/Kingwood Pike the traffic analysis determined that the intersection would operate at failure (overall intersection LOS F) if existing intersection conditions and operations were to remain the same 30-years in the future (design year) without any improvements. Adding only left turn lanes on Greenbag Road at the Dorsey/Kingwood Pike intersection was evaluated during an initial round of traffic analysis because this option had been suggested by the MPO. The option included upgrading the signal lights to have a protected/permissive left turn phase. The analysis showed that this option would result in some intersection improvements but could not achieve LOS C or better for the overall intersection operation. The overall intersection would operate at an unacceptable LOS (LOS E). In addition, the left turn lane option would result in the eastbound Greenbag Road traffic queue to extend past the Bluegrass Village Driveway. The traffic analysis determined that with installation of a roundabout the overall intersection would operate at a LOS C, meeting WVDOH design year criteria. At the intersection of Greenbag Road/Mississippi Avenue the traffic analysis determined that the intersection would operate at failure (overall intersection LOS F) if existing intersection conditions and operations were to remain the same 30-years in the future (design year) without any improvements. The design year with improvements scenarios evaluated determined that with installation of a roundabout the overall intersection would operate at a LOS A, best operating conditions, for all peak hours studied. Installation of a traffic signal with turn lanes resulted in an overall intersection LOS B during the AM peak hour, with the Mississippi Avenue approach operating at a LOS C. Though the analysis meets WVDOH minimum LOS criteria, the roundabout option exceeds WVDOH minimum LOS criteria. Roundabouts help reduce vehicular delay and promotes a continuous flow of traffic, which increases traffic capacity at an intersection. Conscious Harvest Cooperative Community Garden, Joy and Hemp Universal LLC, and Mockingbird Hill Farms are located on private property and the property owner will be compensated for the sale of any land to the WVDOH during the right-of-way acquisition process. Impacts to this parcel have been minimized to the extent practicable. Approximately 1.56 acres (67,900 square feet) will be required from the parcel.

	Fair market value will be paid for all properties that require full or partial acquisition as a result of the project. When only part of the property is required, as is the case with this parcel, fair market value of the part taken will be paid, plus damages, if any, to the residue, less all benefits. West Virginia law defines “market value” as the price a willing buyer would pay a willing seller, neither acting under compulsion nor duress, both exercising prudence and intelligent judgment as to its value and familiar with the purpose for which the property is reasonably available. Fair market value will be determined by a competent, professional real estate appraiser after a thorough inspection of the property, a comparison with similar properties in the area that have been sold recently, a determination and consideration of its replacement cost and depreciation and consideration of the income-producing potential. All appraisal reports are office-reviewed, then rechecked in the field by experienced, qualified review appraisers for accuracy. Since the Division of Highways has adopted a firm price policy, the property owner will be offered the full amount of the approved appraisal. There will be no attempt to buy property at less than fair market value. This policy guarantees that all citizens of the state receive full value for the money expended for highway rights of way. Those who hold a valid property interest in the property that is acquired for the project will be compensated during the ROW acquisition phase. The traffic control plan will continue to be revised during final design, and will not use Aaron’s Creek Road as a signed detour. The revised plan intends to utilize the center of the Dorsey/Kingwood roundabout as a temporary intersection with temporary traffic signals. A short-term detour is proposed using Summers School Road while constructing the connection of the existing Kingwood Pike with the new portion. Road repair beyond the scope of this project is being addressed through the Governor's Roads to Prosperity program and progress can be tracked via the WVDOH website.
657	The existing grade on Kingwood Pike requires stopping on a -6.5% grade at the traffic signal. The grade approaching the roundabout includes a flat grade of less than 2% at the roundabout. In most cases, the roundabout will not require approaching traffic to come to a full or immediate stop, and does not queue traffic on the steep grade as the existing traffic signal does.
658	The preliminary investigation and engineering traffic study has examined two build alternatives and three options for each of the major intersections. The intersection options that were evaluated and analyzed include turning lanes, traffic signals, and roundabouts. WVDOH requires intersection improvements to meet or exceed an overall intersection LOS C or better during the peak hours studied for design year improvements. The times of day (peak hours) selected to be studied followed WVDOH guidelines and is standard traffic engineering practice for determining future intersection improvements. At the intersection of Greenbag Road/Dorsey Avenue/Kingwood Pike the traffic analysis determined that the intersection would operate at failure (overall intersection LOS F) if existing intersection conditions and operations were to remain the same 30-years in the future (design year) without any improvements. Adding only left turn lanes on Greenbag Road at the Dorsey/Kingwood Pike intersection was evaluated during

	an initial round of traffic analysis because this option had been suggested by the MPO. The option included upgrading the signal lights to have a protected/permissive left turn phase. The analysis showed that this option would result in some intersection improvements but could not achieve LOS C or better for the overall intersection operation. The overall intersection would operate at an unacceptable LOS (LOS E). In addition, the left turn lane option would result in the eastbound Greenbag Road traffic queue to extend past the Bluegrass Village Driveway. The traffic analysis determined that with installation of a roundabout the overall intersection would operate at a LOS C, meeting WVDOH design year criteria. Conscious Harvest Cooperative Community Garden, Joy and Hemp Universal LLC, and Mockingbird Hill Farms are located on private property and the property owner will be compensated for the sale of any land to the WVDOH during the right-of-way acquisition process. Impacts to this parcel have been minimized to the extent practicable. Approximately 1.56 acres (67,900 square feet) will be required from the parcel. Fair market value will be paid for all properties that require full or partial acquisition as a result of the project. When only part of the property is required, as is the case with this parcel, fair market value of the part taken will be paid, plus damages, if any, to the residue, less all benefits. West Virginia law defines “market value” as the price a willing buyer would pay a willing seller, neither acting under compulsion nor duress, both exercising prudence and intelligent judgment as to its value and familiar with the purpose for which the property is reasonably available. Fair market value will be determined by a competent, professional real estate appraiser after a thorough inspection of the property, a comparison with similar properties in the area that have been sold recently, a determination and consideration of its replacement cost and depreciation and consideration of the income-producing potential. All appraisal reports are office-reviewed, then rechecked in the field by experienced, qualified review appraisers for accuracy. Since the Division of Highways has adopted a firm price policy, the property owner will be offered the full amount of the approved appraisal. There will be no attempt to buy property at less than fair market value. This policy guarantees that all citizens of the state receive full value for the money expended for highway rights of way. Those who hold a valid property interest in the property that is acquired for the project will be compensated during the ROW acquisition phase. Any property needed for the project will be acquired under the Uniform Relocation Assistance and Real Property Acquisition Act (1970). Moving the roundabout to the north into the former Atomic Grill location is not feasible given the topography and approach angles.
659	Road repair beyond the scope of this project is being addressed through the Governor's Roads to Prosperity program and progress can be tracked via the WVDOH website.
660	Road repair beyond the scope of this project is being addressed through the Governor's Roads to Prosperity program and progress can be tracked via the WVDOH website.

661	Road repair beyond the scope of this project is being addressed through the Governor's Roads to Prosperity program and progress can be tracked via the WVDOH website.
662	The EA reported impacts to Federal Farmland Protection Policy Act (FPPA) soils. The entire Greenbag Road environmental study area is encompassed by "land already in or committed to urban development" as defined by the FPPA (see 7 CFR § 658.2 - Definitions) and is therefore not subject to provisions of FPPA. Please refer to the Farmland Appendix attached to the FONSI for further detail. LESA criteria are used under the FPPA. An FPPA review of the project shows that the entire project corridor is within land designated as urbanized area on the US Census Bureau Map and is considered land already in or committed to urban development by the act. Therefore, the Land Evaluation and Site Assessment is not applicable to this project. Conscious Harvest Cooperative Community Garden, Joy and Hemp Universal LLC, and Mockingbird Hill Farms are located on private property and the property owner will be compensated for the sale of any land to the WVDOH during the right-of-way acquisition process. Impacts to this parcel have been minimized to the extent practicable. Approximately 1.56 acres (67,900 square feet) will be required from the parcel. Fair market value will be paid for all properties that require full or partial acquisition as a result of the project. When only part of the property is required, as is the case with this parcel, fair market value of the part taken will be paid, plus damages, if any, to the residue, less all benefits. West Virginia law defines "market value" as the price a willing buyer would pay a willing seller, neither acting under compulsion nor duress, both exercising prudence and intelligent judgment as to its value and familiar with the purpose for which the property is reasonably available. Fair market value will be determined by a competent, professional real estate appraiser after a thorough inspection of the property, a comparison with similar properties in the area that have been sold recently, a determination and consideration of its replacement cost and depreciation and consideration of the income-producing potential. All appraisal reports are office-reviewed, then rechecked in the field by experienced, qualified review appraisers for accuracy. Since the Division of Highways has adopted a firm price policy, the property owner will be offered the full amount of the approved appraisal. There will be no attempt to buy property at less than fair market value. This policy guarantees that all citizens of the state receive full value for the money expended for highway rights of way. Those who hold a valid property interest in the property that is acquired for the project will be compensated during the ROW acquisition phase. The NEPA process was followed by the WVDOH and FHWA during development of the project. Initially the project was evaluated as a Categorical Exclusion but following the April 2019 public meeting, FHWA elevated the documentation to an Environmental Assessment. During the development of the EA multiple alternatives were evaluated for impacts to the project area. Public comments have been solicited following the April 2019 meeting and a second virtual meeting in September 2019. Both of these comment periods were extended beyond the traditional

	30 days to accommodate public commenters. The EA has been reviewed and approved by the FHWA with a finding of No Significant Impact, therefore, an EIS is not warranted.
663	Conscious Harvest Cooperative Community Garden, Joy and Hemp Universal LLC, and Mockingbird Hill Farms are located on private property and the property owner will be compensated for the sale of any land to the WVDOH during the right-of-way acquisition process. Impacts to this parcel have been minimized to the extent practicable. Approximately 1.56 acres (67,900 square feet) will be required from the parcel. Fair market value will be paid for all properties that require full or partial acquisition as a result of the project. When only part of the property is required, as is the case with this parcel, fair market value of the part taken will be paid, plus damages, if any, to the residue, less all benefits. West Virginia law defines "market value" as the price a willing buyer would pay a willing seller, neither acting under compulsion nor duress, both exercising prudence and intelligent judgment as to its value and familiar with the purpose for which the property is reasonably available. Fair market value will be determined by a competent, professional real estate appraiser after a thorough inspection of the property, a comparison with similar properties in the area that have been sold recently, a determination and consideration of its replacement cost and depreciation and consideration of the income-producing potential. All appraisal reports are office-reviewed, then rechecked in the field by experienced, qualified review appraisers for accuracy. Since the Division of Highways has adopted a firm price policy, the property owner will be offered the full amount of the approved appraisal. There will be no attempt to buy property at less than fair market value. This policy guarantees that all citizens of the state receive full value for the money expended for highway rights of way. Those who hold a valid property interest in the property that is acquired for the project will be compensated during the ROW acquisition phase. Roundabouts are designed to maintain a constant flow of traffic through the intersection which results in reduced congestion on roadways and a reduction in delays for drivers. Studies have shown that changing signalized intersections to roundabouts can have up to an 89% average reduction in vehicle delays. The improved traffic flow also results in reduced vehicle emissions including carbon monoxide, nitrous oxide, and carbon dioxide at the intersection. Additionally, roundabouts are designed to slow speeds in the approach and through the roundabout allowing drivers more response time and limiting the number of potential directions where traffic could approach.
664	The existing grade on Kingwood Pike requires stopping on a -6.5% grade at the traffic signal. The grade approaching the roundabout includes a flat grade of less than 2% at the roundabout. In most cases, the roundabout will not require approaching traffic to come to a full or immediate stop, and does not queue traffic on the steep grade as the existing traffic signal does. The WVDOH has an educational video on how to use a roundabout available for viewing at https://www.youtube.com/watch?v=7njH4MKyo0w.
665	The MMMPO had completed several previous studies evaluating various transportation plans for the Greenbag Road corridor, with the ultimate vision of transforming Greenbag Road into a safe, efficient, and attractive multimodal transportation facility. The scenarios determined to be

	evaluated in the traffic study evolved from the outcome of the MMMPO's preliminary studies and findings. Existing two-way stop controlled operations with potential roadway improvements were evaluated as part of the traffic, as well as traffic signal and roundabout options. The intersection of Greenbag Road/Dorsey Avenue/Kingwood Pike is currently controlled by a traffic signal and not by a four-way (all-way) stop, which includes stop sign control on each approach. The intersection would operate at failure (overall intersection LOS F) if existing intersection conditions and operations (traffic signal control) were to remain the same 30-years in the future (design year) without any improvements. Therefore, traffic analysis was not completed for a four-way (all-way) stop controlled intersection operations.
666	The roundabouts were designed to accommodate AASHTO WB-62 truck configuration, which is an interstate semi-truck with a 62' wheel base between steer axle and last trailer axle, including a 48' trailer. Larger trucks can navigate the roundabout and use the internal truck apron.
667	Adding only left turn lanes on Greenbag Road at the Dorsey/Kingwood Pike intersection was evaluated during an initial round of traffic analysis because this option had been suggested by the MPO. The option included upgrading the signal lights to have a protected/permissive left turn phase. The analysis showed that this option would result in some intersection improvements but could not achieve LOS C or better for the overall intersection operation. The overall intersection would operate at an unacceptable LOS (LOS E or F). The eastbound Greenbag Road traffic queue would extend past the Bluegrass Village Driveway. Based on these findings this option was replaced with Options D and E for the EA analysis. The EA reviewed multiple alternatives including turn lanes, traffic lights, and the roundabouts. Through the analysis in the EA, the only alternative that meets the purpose and need of the project is the roundabout.
668	The EA reviewed multiple alternatives including turn lanes, traffic lights, and the roundabouts. Through the analysis in the EA, the only alternative that meets the purpose and need of the project is the roundabout. The WVDOH has an educational video on how to use a roundabout available for viewing at https://www.youtube.com/watch?v=7njH4MKyo0w. Roundabouts help reduce the likelihood and severity of collisions. Studies by the Federal Highway Administration (FHWA) have shown that roundabouts typically achieve reduction in overall collisions, injury collisions, fatality collisions, and pedestrian collisions. Reasons for these reductions due to the installation of a roundabout include: Low travel speeds – Drivers must slow down and yield to traffic before entering a roundabout. The reduction in speeds results in a decrease in crash severity and injury.

	No traffic light "to beat" – The design of a roundabout promotes a continuous circular flow of traffic. Because of this design, drivers will not have the incentive to speed up to "beat the light", like they may at a traditional intersection. One way travel – The design of a roundabout directs drivers through gently designed curves into a one-way counterclockwise circular path. This design eliminates the possibilities for T-bone and head-on collisions. In addition, a conventional 4-way intersection has 32 points of vehicle conflict due to the different maneuvers through the intersection. A roundabout has 8 points of conflict, which all occur in the same direction, reducing crash severity and likelihood of injury. One of the major differences between Greenbag Road and the Mileground, is the volume of traffic. Greenbag Road has less than half the traffic volume that Mileground has. A second major difference is the general configuration of the roundabouts. The proposed roundabouts on Greenbag are more straightforward and more traditional roundabout designs, without all of the confusing lanes that are present at Mileground. The roundabouts on Greenbag Road will be more intuitive for drivers. The EA reported impacts to Federal Farmland Protection Policy Act (FPPA) soils. The entire Greenbag Road environmental study area is encompassed by "land already in or committed to urban development" as defined by the FPPA (see 7 CFR § 658.2 - Definitions) and is therefore not subject to provisions of FPPA. Please refer to the Farmland Appendix attached to the FONSI for further detail. Conscious Harvest Cooperative Community Garden, Joy and Hemp Universal LLC, and Mockingbird Hill Farms are located on private property and the property owner will be compensated for the sale of any land to the WVDOH during the right-of-way acquisition process. Impacts to this parcel have been minimized to the extent practicable. Approximately 1.56 acres (67,900 square feet) will be required from the parcel. Fair market value will be paid for all properties that require full or partial acquisition as a result of the project. When only part of the property is required, as is the case with this parcel, fair market value of the part taken will be paid, plus damages, if any, to the residue, less all benefits. West Virginia law defines "market value" as the price a willing buyer would pay a willing seller, neither acting under compulsion nor duress, both exercising prudence and intelligent judgment as to its value and familiar with the purpose for which the property is reasonably available. Fair market value will be determined by a competent, professional real estate appraiser after a thorough inspection of the property, a comparison with similar properties in the area that have been sold recently, a determination and consideration of its replacement cost and depreciation and consideration of the income-producing potential. All appraisal reports are office-reviewed, then rechecked in the field by experienced, qualified review appraisers for accuracy. Since the Division of Highways has adopted a firm price policy, the property owner will be offered the full amount of the approved appraisal. There will be no attempt to buy property at less than fair market value. This policy guarantees that all citizens of the state receive full value for the money expended for highway rights of way.

	Those who hold a valid property interest in the property that is acquired for the project will be compensated during the ROW acquisition phase.
669	Both the MMMPO corridor study and the 2018 traffic study determined that traffic flow through the corridor is controlled by the congestion at the major intersections in the corridor. The projected growth in the Morgantown area will continue to increase traffic and congestion at the intersections if improvements do not occur. Any property needed for the project will be acquired under the Uniform Relocation Assistance and Real Property Acquisition Act (1970) through negotiations with the landowners.
670	The preliminary investigation and engineering traffic study has examined two build alternatives and three options for each of the major intersections. The intersection options that were evaluated and analyzed include turning lanes, traffic signals, and roundabouts. WVDOH requires intersection improvements to meet or exceed an overall intersection LOS C or better during the peak hours studied for design year improvements. The times of day (peak hours) selected to be studied followed WVDOH guidelines and is standard traffic engineering practice for determining future intersection improvements. At the intersection of Greenbag Road/Dorsey Avenue/Kingwood Pike the traffic analysis determined that the intersection would operate at failure (overall intersection LOS F) if existing intersection conditions and operations were to remain the same 30-years in the future (design year) without any improvements. Adding only left turn lanes on Greenbag Road at the Dorsey/Kingwood Pike intersection was evaluated during an initial round of traffic analysis because this option had been suggested by the MPO. The option included upgrading the signal lights to have a protected/permissive left turn phase. The analysis showed that this option would result in some intersection improvements but could not achieve LOS C or better for the overall intersection operation. The overall intersection would operate at an unacceptable LOS (LOS E). In addition, the left turn lane option would result in the eastbound Greenbag Road traffic queue to extend past the Bluegrass Village Driveway. The traffic analysis determined that with installation of a roundabout the overall intersection would operate at a LOS C, meeting WVDOH design year criteria.
671	The MMMPO had completed several previous studies evaluating various transportation plans for the Greenbag Road corridor, with the ultimate vision of transforming Greenbag Road into a safe, efficient, and attractive multimodal transportation facility. The scenarios determined to be evaluated in the traffic study evolved from the outcome of the MMMPO's preliminary studies and findings. Existing two-way stop controlled operations with potential roadway improvements were evaluated as part of the traffic, as well as traffic signal and roundabout options. The intersection of Greenbag Road/Dorsey Avenue/Kingwood Pike is currently controlled by a traffic signal and not by a four-way (all-way) stop, which includes stop sign control on each approach. The intersection would operate at failure (overall intersection LOS F) if existing

	intersection conditions and operations (traffic signal control) were to remain the same 30-years in the future (design year) without any improvements. Therefore, traffic analysis was not completed for a four-way (all-way) stop controlled intersection operations.
672	Conscious Harvest Cooperative Community Garden, Joy and Hemp Universal LLC, and Mockingbird Hill Farms are located on private property and the property owner will be compensated for the sale of any land to the WVDOH during the right-of-way acquisition process. Impacts to this parcel have been minimized to the extent practicable. Approximately 1.56 acres (67,900 square feet) will be required from the parcel. Fair market value will be paid for all properties that require full or partial acquisition as a result of the project. When only part of the property is required, as is the case with this parcel, fair market value of the part taken will be paid, plus damages, if any, to the residue, less all benefits. West Virginia law defines "market value" as the price a willing buyer would pay a willing seller, neither acting under compulsion nor duress, both exercising prudence and intelligent judgment as to its value and familiar with the purpose for which the property is reasonably available. Fair market value will be determined by a competent, professional real estate appraiser after a thorough inspection of the property, a comparison with similar properties in the area that have been sold recently, a determination and consideration of its replacement cost and depreciation and consideration of the income-producing potential. All appraisal reports are office-reviewed, then rechecked in the field by experienced, qualified review appraisers for accuracy. Since the Division of Highways has adopted a firm price policy, the property owner will be offered the full amount of the approved appraisal. There will be no attempt to buy property at less than fair market value. This policy guarantees that all citizens of the state receive full value for the money expended for highway rights of way. Those who hold a valid property interest in the property that is acquired for the project will be compensated during the ROW acquisition phase. The potential for the proposed improvements to impact environmental justice communities was analyzed as part of the EA. Please refer to the EA and appendices for more information: https://transportation.wv.gov/highways/engineering/comment/closed/greenbagroadimprovementproject/Pages/default.aspx.
673	Conscious Harvest Cooperative Community Garden, Joy and Hemp Universal LLC, and Mockingbird Hill Farms are located on private property and the property owner will be compensated for the sale of any land to the WVDOH during the right-of-way acquisition process. Impacts to this parcel have been minimized to the extent practicable. Approximately 1.56 acres (67,900 square feet) will be required from the parcel. Fair market value will be paid for all properties that require full or partial acquisition as a result of the project. When only part of the property is required, as is the case with this parcel, fair market value of the part taken will be paid, plus damages, if any, to the residue, less all benefits. West Virginia law defines "market value" as the price a willing buyer would pay a willing seller, neither acting under compulsion nor duress, both exercising prudence and intelligent judgment as to its value and familiar with the purpose for which the property is reasonably available. Fair market value will be determined by a competent, professional real estate appraiser after a thorough inspection of the property, a comparison

	with similar properties in the area that have been sold recently, a determination and consideration of its replacement cost and depreciation and consideration of the income-producing potential. All appraisal reports are office-reviewed, then rechecked in the field by experienced, qualified review appraisers for accuracy. Since the Division of Highways has adopted a firm price policy, the property owner will be offered the full amount of the approved appraisal. There will be no attempt to buy property at less than fair market value. This policy guarantees that all citizens of the state receive full value for the money expended for highway rights of way. Those who hold a valid property interest in the property that is acquired for the project will be compensated during the ROW acquisition phase. At the intersection of Greenbag Road/Dorsey Avenue/Kingwood Pike the traffic analysis determined that the intersection would operate at failure (overall intersection LOS F) if existing intersection conditions and operations were to remain the same 30-years in the future (design year) without any improvements. Adding only left turn lanes on Greenbag Road at the Dorsey/Kingwood Pike intersection was evaluated during an initial round of traffic analysis because this option had been suggested by the MPO. The option included upgrading the signal lights to have a protected/permissive left turn phase. The analysis showed that this option would result in some intersection improvements but could not achieve LOS C or better for the overall intersection operation. The overall intersection would operate at an unacceptable LOS (LOS E). In addition, the left turn lane option would result in the eastbound Greenbag Road traffic queue to extend past the Bluegrass Village Driveway. The traffic analysis determined that with installation of a roundabout the overall intersection would operate at a LOS C, meeting WVDOH design year criteria. The proposed roundabouts on Greenbag are more straightforward and more traditional roundabout designs, without all of the confusing lanes that are sometimes present. The roundabouts on Greenbag Road will be more intuitive for drivers.
674	A shared-use path was part of some early versions of the project, but the right of way impacts along Bluegrass Village and the Kennedy Center were significant. Due to these detrimental impacts the shared use path was removed from the alternatives that were advanced to the EA. The sidewalk design has been extended from the western end of the project area along Greenbag Road to the Dorsey Avenue/Kingwood Pike intersection. At the intersection the sidewalk follows Dorsey Avenue north to Luckey Lane and east on Luckey Lane to the connection with the existing sidewalk at Mountainview Elementary School. The shoulder along the north side of Greenbag Road is being designed to accommodate bicycle use by being wider (3 feet) than the standard shoulder (2 feet). Extensions beyond the scope of this project can be considered during future planning.
675	The aquatic resources study was conducted based on the guiding manuals for wetland and stream identification. The wetland study adhered to the USACE Corps of Engineers Wetland Delineation Manual and the Regional Supplement to the Corps of Engineers Wetland Delineation Manual: Eastern Mountains and Piedmont Region. The stream identification and classification was based on the definitions from Title 46 and the West Virginia Surface Mining Rules. The study identified and delineated 8 palustrine wetlands and 13 jurisdictional watercourses within the

	project study area. More information is available in the EA appendices. The EA and appendices are available on the WVDOH website: https://transportation.wv.gov/highways/engineering/comment/closed/greenbagroadimprovementproject/Pages/default.aspx. Any changes to aquatic resource impacts in final design will be identified and included in the mitigation plan.
676	Conscious Harvest Cooperative Community Garden, Joy and Hemp Universal LLC, and Mockingbird Hill Farms are located on private property and the property owner will be compensated for the sale of any land to the WVDOH during the right-of-way acquisition process. Impacts to this parcel have been minimized to the extent practicable. Approximately 1.56 acres (67,900 square feet) will be required from the parcel. Fair market value will be paid for all properties that require full or partial acquisition as a result of the project. When only part of the property is required, as is the case with this parcel, fair market value of the part taken will be paid, plus damages, if any, to the residue, less all benefits. West Virginia law defines "market value" as the price a willing buyer would pay a willing seller, neither acting under compulsion nor duress, both exercising prudence and intelligent judgment as to its value and familiar with the purpose for which the property is reasonably available. Fair market value will be determined by a competent, professional real estate appraiser after a thorough inspection of the property, a comparison with similar properties in the area that have been sold recently, a determination and consideration of its replacement cost and depreciation and consideration of the income-producing potential. All appraisal reports are office-reviewed, then rechecked in the field by experienced, qualified review appraisers for accuracy. Since the Division of Highways has adopted a firm price policy, the property owner will be offered the full amount of the approved appraisal. There will be no attempt to buy property at less than fair market value. This policy guarantees that all citizens of the state receive full value for the money expended for highway rights of way. Those who hold a valid property interest in the property that is acquired for the project will be compensated during the ROW acquisition phase. The nature of and impact to this parcel and its uses will be addressed during the acquisition of any necessary portion in a manner that fully addresses any displacement. The community garden is located on private property and the property owner will be compensated for the sale of any land to the WVDOH during the right-of-way acquisition process. Impacts to this parcel have been minimized to the extent practicable. Fair market value will be paid for all properties that require full or partial acquisition as a result of the project. When only part of the property is required, as is the case with this parcel, fair market value of the part taken will be paid, plus damages, if any, to the residue, less all benefits.
677	Fair market value will be paid for all properties that require full or partial acquisition as a result of the project. When only part of the property is required, as is the case with this property, fair market value of the part taken will be paid, plus damages, if any, to the residue, less all benefits. West Virginia law defines "market value" as the price a willing buyer would pay a willing seller, neither acting under compulsion nor duress, both exercising prudence and intelligent judgment as to its value and familiar with the purpose for which the property is reasonably available. Fair market value will be determined by a competent, professional real estate appraiser after a thorough inspection of the property, a comparison

	with similar properties in the area that have been sold recently, a determination and consideration of its replacement cost and depreciation and consideration of the income-producing potential. All appraisal reports are office-reviewed, then rechecked in the field by experienced, qualified review appraisers for accuracy. Since the Division of Highways has adopted a firm price policy, the property owner will be offered the full amount of the approved appraisal. There will be no attempt to buy property at less than fair market value. This policy guarantees that all citizens of the state receive full value for the money expended for highway rights of way.
678	The EA reported impacts to Federal Farmland Protection Policy Act (FPPA) soils. The entire Greenbag Road environmental study area is encompassed by "land already in or committed to urban development" as defined by the FPPA (see 7 CFR § 658.2 - Definitions) and is therefore not subject to provisions of FPPA. Please refer to the Farmland Appendix attached to the FONSI for further detail. LESA criteria are used under the FPPA. An FPPA review of the project shows that the entire project corridor is within land designated as urbanized area on the US Census Bureau Map and is considered land already in or committed to urban development by the act. Therefore, the Land Evaluation and Site Assessment is not applicable to this project. Conscious Harvest Cooperative Community Garden, Joy and Hemp Universal LLC, and Mockingbird Hill Farms are located on private property and the property owner will be compensated for the sale of any land to the WVDOH during the right-of-way acquisition process. Impacts to this parcel have been minimized to the extent practicable. Approximately 1.56 acres (67,900 square feet) will be required from the parcel. Fair market value will be paid for all properties that require full or partial acquisition as a result of the project. When only part of the property is required, as is the case with this parcel, fair market value of the part taken will be paid, plus damages, if any, to the residue, less all benefits. West Virginia law defines "market value" as the price a willing buyer would pay a willing seller, neither acting under compulsion nor duress, both exercising prudence and intelligent judgment as to its value and familiar with the purpose for which the property is reasonably available. Fair market value will be determined by a competent, professional real estate appraiser after a thorough inspection of the property, a comparison with similar properties in the area that have been sold recently, a determination and consideration of its replacement cost and depreciation and consideration of the income-producing potential. All appraisal reports are office-reviewed, then rechecked in the field by experienced, qualified review appraisers for accuracy. Since the Division of Highways has adopted a firm price policy, the property owner will be offered the full amount of the approved appraisal. There will be no attempt to buy property at less than fair market value. This policy guarantees that all citizens of the state receive full value for the money expended for highway rights of way. Those who hold a valid property interest in the property that is acquired for the project will be compensated during the ROW acquisition phase. The EA has been reviewed and approved by the FHWA with a finding of No Significant Impact, therefore, an EIS is not warranted.
679	The sidewalk design has been extended from the western end of the project area along Greenbag Road to the Dorsey Avenue/Kingwood Pike intersection. At the intersection the sidewalk follows Dorsey Avenue north to Luckey Lane and east on Luckey Lane to the connection with the

	existing sidewalk at Mountainview Elementary School. The shoulder along the north side of Greenbag Road is being designed to accommodate bicycle use by being wider (3 feet) than the standard shoulder (2 feet). Extensions beyond the scope of this project can be considered during future planning.
680	The EA reported impacts to Federal Farmland Protection Policy Act (FPPA) soils. The entire Greenbag Road environmental study area is encompassed by "land already in or committed to urban development" as defined by the FPPA (see 7 CFR § 658.2 - Definitions) and is therefore not subject to provisions of FPPA. The WVDOH complied with the public involvement requirements of the National Environmental Policy Act and Section 106 of the National Historic Preservation Act through the public meetings of April 16, 2019 and September 29, 2020.
687	Those who hold a valid property interest in the property that is acquired for the project will be compensated during the ROW acquisition phase.
688	The roundabouts were designed to accommodate AASHTO WB-62 truck configuration, which is an interstate semi-truck with a 62’ wheel base between steer axle and last trailer axle, including a 48’ trailer. Larger trucks can navigate the roundabout and use the internal truck apron. The preliminary investigation and engineering traffic study has examined two build alternatives and three options for each of the major intersections. The intersection options that were evaluated and analyzed include turning lanes, traffic signals, and roundabouts. WVDOH requires intersection improvements to meet or exceed an overall intersection LOS C or better during the peak hours studied for design year improvements. The times of day (peak hours) selected to be studied followed WVDOH guidelines and is standard traffic engineering practice for determining future intersection improvements. At the intersection of Greenbag Road/Dorsey Avenue/Kingwood Pike the traffic analysis determined that the intersection would operate at failure (overall intersection LOS F) if existing intersection conditions and operations were to remain the same 30-years in the future (design

	year) without any improvements. Adding only left turn lanes on Greenbag Road at the Dorsey/Kingwood Pike intersection was evaluated during an initial round of traffic analysis because this option had been suggested by the MPO. The option included upgrading the signal lights to have a protected/permissive left turn phase. The analysis showed that this option would result in some intersection improvements but could not achieve LOS C or better for the overall intersection operation. The overall intersection would operate at an unacceptable LOS (LOS E). In addition, the left turn lane option would result in the eastbound Greenbag Road traffic queue to extend past the Bluegrass Village Driveway. The traffic analysis determined that with installation of a roundabout the overall intersection would operate at a LOS C, meeting WVDOH design year criteria. The intersection of Greenbag Road/Dorsey Avenue/Kingwood Pike is currently controlled by a traffic signal and not by a four-way (all-way) stop, which includes stop sign control on each approach. The intersection would operate at failure (overall intersection LOS F) if existing intersection conditions and operations (traffic signal control) were to remain the same 30-years in the future (design year) without any improvements. Therefore, traffic analysis was not completed for a four-way (all-way) stop controlled intersection operations.
689	The traffic control plan, which will outline the intended traffic detour tour, will continue to be revised during final design. It should be noted that Aaron's Creek Road will not be utilized as a signed detour. The anticipated plan intends to utilize the center of the Dorsey Avenue /Kingwood Pike roundabout as a temporary intersection with temporary traffic signals during construction. A short-term detour is proposed using Summers School Road while constructing the connection of the existing Kingwood Pike with the new portion.
690	Both the MMMPO corridor study and the 2018 traffic study determined that traffic flow through the corridor is controlled by the congestion at the major intersections in the corridor. The projected growth in the Morgantown area will continue to increase traffic and congestion at the intersections if improvements do not occur. Multiple options were considered during the initial traffic study and the preliminary design phase. The options included in the EA analysis met the purpose and need for the project in a feasible manner.
691	The traffic control plan, which will outline the intended traffic detour tour, will continue to be revised during final design. It should be noted that Aaron's Creek Road will not be utilized as a signed detour. The anticipated plan intends to utilize the center of the Dorsey Avenue /Kingwood Pike roundabout as a temporary intersection with temporary traffic signals during construction. A short-term detour is proposed using Summers School Road while constructing the connection of the existing Kingwood Pike with the new portion.
692	At the intersection of Greenbag Road/Dorsey Avenue/Kingwood Pike the traffic analysis determined that the intersection would operate at failure (overall intersection LOS F) if existing intersection conditions and operations were to remain the same 30-years in the future (design year) without any improvements. Adding only left turn lanes on Greenbag Road at the Dorsey/Kingwood Pike intersection was evaluated during an initial round of traffic analysis because this option had been suggested by the MPO. The option included upgrading the signal lights to have a protected/permissive left turn phase. The analysis showed that this option would result in some intersection improvements but could not

	achieve LOS C or better for the overall intersection operation. The overall intersection would operate at an unacceptable LOS (LOS E). In addition, the left turn lane option would result in the eastbound Greenbag Road traffic queue to extend past the Bluegrass Village Driveway. The traffic analysis determined that with installation of a roundabout the overall intersection would operate at a LOS C, meeting WVDOH design year criteria.
693	The preliminary investigation and engineering traffic study was completed to evaluate the Greenbag Road corridor, evaluating the existing and potential future operation of the intersections selected for study by WVDOH. The Greenbag Road corridor has long been recognized as a challenging roadway to navigate due to geometric deficiencies, significant intersection delays during the peak hours, and increased volume of truck traffic and development within the corridor. Several studies have been previously completed through the MMMPO, evaluating various transportation plans for the Greenbag Road corridor, with the ultimate vision of transforming Greenbag Road into a safe, efficient, and attractive multimodal transportation facility. It should be noted that the traffic evaluation was completed prior to the COVID-19 pandemic and its effects to traffic currently occurring. The traffic study has examined two build alternatives and three options for each of the major intersections. The intersection options that were evaluated and analyzed include turning lanes, traffic signals, and roundabouts. WVDOH requires intersection improvements to meet or exceed an overall intersection LOS C or better during the peak hours studied for design year improvements. The times of day (peak hours) selected to be studied followed WVDOH guidelines and is standard traffic engineering practice for determining future intersection improvements. At the intersection of Greenbag Road/Dorsey Avenue/Kingwood Pike the traffic analysis determined that the intersection would operate at failure (overall intersection LOS F) if existing intersection conditions and operations were to remain the same 30-years in the future (design year) without any improvements. Adding only left turn lanes on Greenbag Road at the Dorsey/Kingwood Pike intersection was evaluated during an initial round of traffic analysis because this option had been suggested by the MPO. The option included upgrading the signal lights to have a protected/permissive left turn phase. The analysis showed that this option would result in some intersection improvements but could not achieve LOS C or better for the overall intersection operation. The overall intersection would operate at an unacceptable LOS (LOS E). In addition, the left turn lane option would result in the eastbound Greenbag Road traffic queue to extend past the Bluegrass Village Driveway. The traffic analysis determined that with installation of a roundabout the overall intersection would operate at a LOS C, meeting WVDOH design year criteria. One of the major differences between Greenbag Road and the Mileground, is the volume of traffic. Greenbag Road has less than half the traffic volume that Mileground has. A second major difference is the general configuration of the roundabouts. The proposed roundabouts on Greenbag are more straightforward and more traditional roundabout designs, without all of the confusing lanes that are present at Mileground. The roundabouts on Greenbag Road will be more intuitive for drivers. Every roundabout is designed and adapted to the context of its location.

	The traffic control plan, which will outline the intended traffic detour tour, will continue to be revised during final design. It should be noted that Aaron's Creek Road will not be utilized as a signed detour. The anticipated plan intends to utilize the center of the Dorsey Avenue /Kingwood Pike roundabout as a temporary intersection with temporary traffic signals during construction. A short-term detour is proposed using Summers School Road while constructing the connection of the existing Kingwood Pike with the new portion. The preferred alternative is anticipated to require 1.5 to 2 construction seasons.
694	The preliminary investigation and engineering traffic study was completed to evaluate the Greenbag Road corridor, evaluating the existing and potential future operation of the intersections selected for study by WVDOH. The Greenbag Road corridor has long been recognized as a challenging roadway to navigate due to geometric deficiencies, significant intersection delays during the peak hours, and increased volume of truck traffic and development within the corridor. Several studies have been previously completed through the MMMPO, evaluating various transportation plans for the Greenbag Road corridor, with the ultimate vision of transforming Greenbag Road into a safe, efficient, and attractive multimodal transportation facility. It should be noted that the traffic evaluation was completed prior to the COVID-19 pandemic and its effects to traffic currently occurring. The traffic study has examined two build alternatives and three options for each of the major intersections. The intersection options that were evaluated and analyzed include turning lanes, traffic signals, and roundabouts. WVDOH requires intersection improvements to meet or exceed an overall intersection LOS C or better during the peak hours studied for design year improvements. The times of day (peak hours) selected to be studied followed WVDOH guidelines and is standard traffic engineering practice for determining future intersection improvements. At the intersection of Greenbag Road/Dorsey Avenue/Kingwood Pike the traffic analysis determined that the intersection would operate at failure (overall intersection LOS F) if existing intersection conditions and operations were to remain the same 30-years in the future (design year) without any improvements. Adding only left turn lanes on Greenbag Road at the Dorsey/Kingwood Pike intersection was evaluated during an initial round of traffic analysis because this option had been suggested by the MPO. The option included upgrading the signal lights to have a protected/permissive left turn phase. The analysis showed that this option would result in some intersection improvements but could not achieve LOS C or better for the overall intersection operation. The overall intersection would operate at an unacceptable LOS (LOS E). In addition, the left turn lane option would result in the eastbound Greenbag Road traffic queue to extend past the Bluegrass Village Driveway. The traffic analysis determined that with installation of a roundabout the overall intersection would operate at a LOS C, meeting WVDOH design year criteria. At the intersection of Greenbag Road/Mississippi Avenue the traffic analysis determined that the intersection would operate at failure (overall intersection LOS F) if existing intersection conditions and operations were to remain the same 30-years in the future (design year) without any improvements. The design year with improvements scenarios evaluated determined that with installation of a roundabout the overall

	intersection would operate at a LOS A, best operating conditions, for all peak hours studied. Installation of a traffic signal with turn lanes resulted in an overall intersection LOS B during the AM peak hour, with the Mississippi Avenue approach operating at a LOS C. Though the analysis meets WVDOH minimum LOS criteria, the roundabout option exceeds WVDOH minimum LOS criteria. Roundabouts help reduce vehicular delay and promotes a continuous flow of traffic, which increases traffic capacity at an intersection.
695	We appreciate your input regarding the project.
696	The preliminary investigation and engineering traffic study was completed to evaluate the Greenbag Road corridor, evaluating the existing and potential future operation of the intersections selected for study by WVDOH. The Greenbag Road corridor has long been recognized as a challenging roadway to navigate due to geometric deficiencies, significant intersection delays during the peak hours, and increased volume of truck traffic and development within the corridor. Several studies have been previously completed through the MMMPO, evaluating various transportation plans for the Greenbag Road corridor, with the ultimate vision of transforming Greenbag Road into a safe, efficient, and attractive multimodal transportation facility. It should be noted that the traffic evaluation was completed prior to the COVID-19 pandemic and its effects to traffic currently occurring. The traffic study has examined two build alternatives and three options for each of the major intersections. The intersection options that were evaluated and analyzed include turning lanes, traffic signals, and roundabouts. WVDOH requires intersection improvements to meet or exceed an overall intersection LOS C or better during the peak hours studied for design year improvements. The times of day (peak hours) selected to be studied followed WVDOH guidelines and is standard traffic engineering practice for determining future intersection improvements. Conscious Harvest Cooperative Community Garden, Joy and Hemp Universal LLC, and Mockingbird Hill Farms are located on private property and the property owner will be compensated for the sale of any land to the WVDOH during the right-of-way acquisition process. Impacts to this parcel have been minimized to the extent practicable. Approximately 1.56 acres (67,900 square feet) will be required from the parcel. Fair market value will be paid for all properties that require full or partial acquisition as a result of the project. When only part of the property is required, as is the case with this parcel, fair market value of the part taken will be paid, plus damages, if any, to the residue, less all benefits. West Virginia law defines “market value” as the price a willing buyer would pay a willing seller, neither acting under compulsion nor duress, both exercising prudence and intelligent judgment as to its value and familiar with the purpose for which the property is reasonably available. Fair market value will be determined by a competent, professional real estate appraiser after a thorough inspection of the property, a comparison with similar properties in the area that have been sold recently, a determination and consideration of its replacement cost and depreciation and consideration of the income-producing potential. All appraisal reports are office-reviewed, then rechecked in the field by experienced, qualified review appraisers for accuracy. Since the Division of Highways has adopted a firm price policy, the property owner will be offered the full

	amount of the approved appraisal. There will be no attempt to buy property at less than fair market value. This policy guarantees that all citizens of the state receive full value for the money expended for highway rights of way. Those who hold a valid property interest in the property that is acquired for the project will be compensated during the ROW acquisition phase. Road repair beyond the scope of this project is being addressed through the Governor's Roads to Prosperity program and progress can be tracked via the WVDOH website.
697	We appreciate your input regarding the project.
698	The preliminary investigation and engineering traffic study was completed to evaluate the Greenbag Road corridor, evaluating the existing and potential future operation of the intersections selected for study by WVDOH. Comment Number	Comment Response
701	The EA reviewed multiple alternatives including turn lanes, traffic lights, and the roundabouts. Through the analysis in the EA, the only alternative that meets the purpose and need of the project is the roundabout. The turn lane options that were examined do not improve the level of service as much as the roundabout and the turn lanes at Dorsey Avenue/Kingwood Pike involve complete takes of 2 residences and 1 business. These takes are different from what was reported in the EA.

	This change will be noted in the FONSI. Adding only left turn lanes on Greenbag Road at the Dorsey/Kingwood Pike intersection was evaluated during an initial round of traffic analysis because this option had been suggested by the MPO. The option included upgrading the signal lights to have a protected/permissive left turn phase. The analysis showed that this option would result in some intersection improvements but could not achieve LOS C or better for the overall intersection operation. The overall intersection would operate at an unacceptable LOS (LOS E or F). The eastbound Greenbag Road traffic queue would extend past the Bluegrass Village Driveway. Based on these findings this option was replaced with Options D and E for the EA analysis.
702	The EA reviewed multiple alternatives including turn lanes, traffic lights, and the roundabouts. Through the analysis in the EA, the only alternative that meets the purpose and need of the project is the roundabout. The sidewalk design has been extended from the western end of the project area along Greenbag Road to the Dorsey Avenue/Kingwood Pike intersection. At the intersection the sidewalk follows Dorsey Avenue north to Luckey Lane and east on Luckey Lane to the connection with the existing sidewalk at Mountainview Elementary School. The shoulder along the north side of Greenbag Road is being designed to accommodate bicycle use by being wider (3 feet) than the standard shoulder (2 feet). Extensions beyond the scope of this project can be considered during future planning. The need for a sidewalk was identified by the public in the comments for the MMMPO corridor study as one of the factors to improve safety in the Greenbag Road corridor. Pedestrians should use the dedicated crosswalks when safely crossing, just like crossing any other intersection. At a roundabout, pedestrian crosswalks will be placed to cross each roadway leg to the roundabout, which is the same as traditional intersection crossings. The roundabout pedestrian crosswalk placement allows pedestrians to cross one direction of traffic a time at each roundabout approach because of the splitter island. Pedestrians should also use the designated crosswalk locations. Crossing to the center of the roundabout is not recommended.
703	The turn lane options that were examined do not improve the level of service as much as the roundabout and the turn lanes at Dorsey Avenue/Kingwood Pike involve complete takes of 2 residences and 1 business. These takes are different from what was reported in the EA. This change will be noted in the FONSI. Adding only left turn lanes on Greenbag Road at the Dorsey/Kingwood Pike intersection was evaluated during an initial round of traffic analysis because this option had been suggested by the MPO. The option included upgrading the signal lights to have a protected/permissive left turn phase. The analysis showed that this option would result in some intersection improvements but could not achieve LOS C or better for the overall intersection operation. The overall intersection would operate at an unacceptable LOS (LOS E or F). The eastbound Greenbag Road traffic queue would extend past the Bluegrass Village Driveway. Based on these findings this option was replaced with Options D and E for the EA analysis.

704	The EA reviewed multiple alternatives including turn lanes, traffic lights, and the roundabouts. 	The traffic study has examined two build alternatives and three options for each of the major intersections. The intersection options that were evaluated and analyzed include turning lanes, traffic signals, and roundabouts. WVDOH requires intersection improvements to meet or exceed an overall intersection LOS C or better during the peak hours studied for design year improvements. The times of day (peak hours) selected to be studied followed WVDOH guidelines and is standard traffic engineering practice for determining future intersection improvements. Through the analysis in the EA, the only alternative that meets the purpose and need of the project is the roundabout. The EA reported impacts to Federal Farmland Protection Policy Act (FPPA) soils. The entire Greenbag Road environmental study area is encompassed by "land already in or committed to urban development" as defined by the FPPA (see 7 CFR § 658.2 - Definitions) and is therefore not subject to provisions of FPPA. Please refer to the Farmland Appendix attached to the FONSI for further detail. Conscious Harvest Cooperative Community Garden, Joy and Hemp Universal LLC, and Mockingbird Hill Farms are located on private property and the property owner will be compensated for the sale of any land to the WVDOH during the right-of-way acquisition process. Impacts to this parcel have been minimized to the extent practicable. Approximately 1.56 acres (67,900 square feet) will be required from the parcel. Fair market value will be paid for all properties that require full or partial acquisition as a result of the project. When only part of the property is required, as is the case with this parcel, fair market value of the part taken will be paid, plus damages, if any, to the residue, less all benefits. West Virginia law defines "market value" as the price a willing buyer would pay a willing seller, neither acting under compulsion nor duress, both exercising prudence and intelligent judgment as to its value and familiar with the purpose for which the property is reasonably available. Fair market value will be determined by a competent, professional real estate appraiser after a thorough inspection of the property, a comparison with similar properties in the area that have been sold recently, a determination and consideration of its replacement cost and depreciation and consideration of the income-producing potential. All appraisal reports are office-reviewed, then rechecked in the field by experienced, qualified review appraisers for accuracy. Since the Division of Highways has adopted a firm price policy, the property owner will be offered the full amount of the approved appraisal. There will be no attempt to buy property at less than fair market value. This policy guarantees that all citizens of the state receive full value for the money expended for highway rights of way. Those who hold a valid property interest in the property that is acquired for the project will be compensated during the ROW acquisition phase.
708	Both the MMMPO corridor study and the 2018 traffic study determined that traffic flow through the corridor is controlled by the congestion at the major intersections in the corridor. The projected growth in the Morgantown area will continue to increase traffic and congestion at the intersections if improvements do not occur. The preliminary investigation and engineering traffic study was completed to evaluate the Greenbag Road corridor, evaluating the existing and potential future operation of the intersections selected for study by WVDOH. The evaluation of existing roadway conditions, including the

	existing roadway conditions of Kingwood Pike, was not part of the preliminary investigation and engineering traffic study. The Greenbag Road corridor has long been recognized as a challenging roadway to navigate due to geometric deficiencies, significant intersection delays during the peak hours, and increased volume of truck traffic and development within the corridor. Several studies have been previously completed through the MMMPO, evaluating various transportation plans for the Greenbag Road corridor, with the ultimate vision of transforming Greenbag Road into a safe, efficient, and attractive multimodal transportation facility. The future traffic along Greenbag Road, Mississippi Avenue, Dorsey Avenue, Kingwood Pike were projected for the future design year by assuming existing traffic distribution/patterns but with increased traffic volumes though application of a yearly traffic growth rate of 1.16% per year. It should be noted that the traffic evaluation was completed prior to the COVID-19 pandemic and its effects to traffic currently occurring. The traffic control plan will continue to be revised during final design, and will not use Aaron's Creek Road as a signed detour. The revised plan intends to utilize the center of the Dorsey/Kingwood roundabout as a temporary intersection with temporary traffic signals. A short-term detour is proposed using Summers School Road while constructing the connection of the existing Kingwood Pike with the new portion. The revised plan intends to utilize the center of the Dorsey/Kingwood roundabout as a temporary intersection with temporary traffic signals. A short-term detour is proposed using Summers School Road while constructing the connection of the existing Kingwood Pike with the new portion. The detour of

	Greenbag Road during construction will be temporary. A maintenance of traffic plan will be in place to minimize delays, maintain access to residences and businesses, and maintain safety for travelers and construction workers.
711	The preliminary investigation and engineering traffic study was completed to evaluate the Greenbag Road corridor, evaluating the existing and potential future operation of the intersections selected for study by WVDOH. The Greenbag Road corridor has long been recognized as a challenging roadway to navigate due to geometric deficiencies, significant intersection delays during the peak hours, and increased volume of truck traffic and development within the corridor. Several studies have been previously completed through the MMMPO, evaluating various transportation plans for the Greenbag Road corridor, with the ultimate vision of transforming Greenbag Road into a safe, efficient, and attractive multimodal transportation facility. It should be noted that the traffic evaluation was completed prior to the COVID-19 pandemic and its effects to traffic currently occurring. The traffic study has examined two build alternatives and three options for each of the major intersections. The intersection options that were evaluated and analyzed include turning lanes, traffic signals, and roundabouts. WVDOH requires intersection improvements to meet or exceed an overall intersection LOS C or better during the peak hours studied for design year improvements. The times of day (peak hours) selected to be studied followed WVDOH guidelines and is standard traffic engineering practice for determining future intersection improvements. Through the analysis in the EA, the only alternative that meets the purpose and need of the project is the roundabout. The turn lane options that were examined do not improve the level of service as much as the roundabout and the turn lanes at Dorsey Avenue/Kingwood Pike involve complete takes of 2 residences and 1 business. These takes are different from what was reported in the EA. This change will be noted in the FONSI. Adding only left turn lanes on Greenbag Road at the Dorsey/Kingwood Pike intersection was evaluated during an initial round of traffic analysis because this option had been suggested by the MPO. The option included upgrading the signal lights to have a protected/permissive left turn phase. The analysis showed that this option would result in some intersection improvements but could not achieve LOS C or better for the overall intersection operation. The overall intersection would operate at an unacceptable LOS (LOS E or F). The eastbound Greenbag Road traffic queue would extend past the Bluegrass Village Driveway. Based on these findings this option was replaced with Options D and E for the EA analysis. Trucks and large vehicles are being considered in the development of the traffic control plan. The traffic control plan will continue to be revised during final design, and will not use Aaron's Creek Road as a signed detour. The revised plan intends to utilize the center of the Dorsey/Kingwood roundabout as a temporary intersection with temporary traffic signals. A short-term detour is proposed using Summers School Road while constructing the connection of the existing Kingwood Pike with the new portion. The preferred alternative is anticipated to require 1.5 to 2 construction seasons.

712	The EA reviewed multiple alternatives including turn lanes, traffic lights, and the roundabouts. Through the analysis in the EA, the only alternative that meets the purpose and need of the project is the roundabout. The preliminary investigation and engineering traffic study has examined two build alternatives and three options for each of the major intersections. The intersection options that were evaluated and analyzed include turning lanes, traffic signals, and roundabouts. WVDOH requires intersection improvements to meet or exceed an overall intersection LOS C or better during the peak hours studied for design year improvements. The times of day (peak hours) selected to be studied followed WVDOH guidelines and is standard traffic engineering practice for determining future intersection improvements. At the intersection of Greenbag Road/Dorsey Avenue/Kingwood Pike the traffic analysis determined that the intersection would operate at failure (overall intersection LOS F) if existing intersection conditions and operations were to remain the same 30-years in the future (design year) without any improvements. Adding only left turn lanes on Greenbag Road at the Dorsey/Kingwood Pike intersection was evaluated during an initial round of traffic analysis because this option had been suggested by the MPO. The option included upgrading the signal lights to have a protected/permissive left turn phase. The analysis showed that this option would result in some intersection improvements but could not achieve LOS C or better for the overall intersection operation. The overall intersection would operate at an unacceptable LOS (LOS E). In addition, the left turn lane option would result in the eastbound Greenbag Road traffic queue to extend past the Bluegrass Village Driveway. The traffic analysis determined that with installation of a roundabout the overall intersection would operate at a LOS C, meeting WVDOH design year criteria. The turn lane options that were examined do not improve the level of service as much as the roundabout and the turn lanes at Dorsey Avenue/Kingwood Pike involve complete takes of 2 residences and 1 business. These takes are different from what was reported in the EA. This change will be noted in the FONSI. Adding only left turn lanes on Greenbag Road at the Dorsey/Kingwood Pike intersection was evaluated during an initial round of traffic analysis because this option had been suggested by the MPO. The option included upgrading the signal lights to have a protected/permissive left turn phase. The analysis showed that this option would result in some intersection improvements but could not achieve LOS C or better for the overall intersection operation. The overall intersection would operate at an unacceptable LOS (LOS E or F). The eastbound Greenbag Road traffic queue would extend past the Bluegrass Village Driveway. Based on these findings this option was replaced with Options D and E for the EA analysis. The intersection of Greenbag Road/Dorsey Avenue/Kingwood Pike is currently controlled by a traffic signal and not by a four-way (all-way) stop, which includes stop sign control on each approach. The intersection would operate at failure (overall intersection LOS F) if existing intersection conditions and operations (traffic signal control) were to remain the same 30-years in the future (design year) without any improvements. Therefore, traffic analysis was not completed for a four-way (all-way) stop controlled intersection operations.

	Trucks and large vehicles are being considered in the development of the traffic control plan. The traffic control plan will continue to be revised during final design and will not use Aaron's Creek Road as a signed detour. The revised plan intends to utilize the center of the Dorsey/Kingwood roundabout as a temporary intersection with temporary traffic signals. A short-term detour is proposed using Summers School Road while constructing the connection of the existing Kingwood Pike with the new portion.
713	The preliminary investigation and engineering traffic study was completed to evaluate the Greenbag Road corridor, evaluating the existing and potential future operation of the intersections selected for study by WVDOH. The Greenbag Road corridor has long been recognized as a challenging roadway to navigate due to geometric deficiencies, significant intersection delays during the peak hours, and increased volume of truck traffic and development within the corridor. Several studies have been previously completed through the MMMPO, evaluating various transportation plans for the Greenbag Road corridor, with the ultimate vision of transforming Greenbag Road into a safe, efficient, and attractive multimodal transportation facility. It should be noted that the traffic evaluation was completed prior to the COVID-19 pandemic and its effects to traffic currently occurring. The traffic study has examined two build alternatives and three options for each of the major intersections. The intersection options that were evaluated and analyzed include turning lanes, traffic signals, and roundabouts. WVDOH requires intersection improvements to meet or exceed an overall intersection LOS C or better during the peak hours studied for design year improvements. The times of day (peak hours) selected to be studied followed WVDOH guidelines and is standard traffic engineering practice for determining future intersection improvements. Through the analysis in the EA, the only alternative that meets the purpose and need of the project is the roundabout. The turn lane options that were examined do not improve the level of service as much as the roundabout and the turn lanes at Dorsey Avenue/Kingwood Pike involve complete takes of 2 residences and 1 business. These takes are different from what was reported in the EA. This change will be noted in the FONSI. Adding only left turn lanes on Greenbag Road at the Dorsey/Kingwood Pike intersection was evaluated during an initial round of traffic analysis because this option had been suggested by the MPO. The option included upgrading the signal lights to have a protected/permissive left turn phase. The analysis showed that this option would result in some intersection improvements but could not achieve LOS C or better for the overall intersection operation. The overall intersection would operate at an unacceptable LOS (LOS E or F). The eastbound Greenbag Road traffic queue would extend past the Bluegrass Village Driveway. Based on these findings this option was replaced with Options D and E for the EA analysis. The traffic control plan will continue to be revised during final design, and will not use Aaron's Creek Road as a signed detour. The revised plan intends to utilize the center of the Dorsey/Kingwood roundabout as a temporary intersection with temporary traffic signals. A short-term detour is proposed using Summers School Road while constructing the connection of the existing Kingwood Pike with the new portion.

714	Both the MMMPO corridor study and the 2018 traffic study determined that traffic flow through the corridor is controlled by the congestion at the major intersections in the corridor. The projected growth in the Morgantown area will continue to increase traffic and congestion at the intersections if improvements do not occur. The traffic study has examined two build alternatives and three options for each of the major intersections. The intersection options that were evaluated and analyzed include turning lanes, traffic signals, and roundabouts. WVDOH requires intersection improvements to meet or exceed an overall intersection LOS C or better during the peak hours studied for design year improvements. The times of day (peak hours) selected to be studied followed WVDOH guidelines and is standard traffic engineering practice for determining future intersection improvements. Through the analysis in the EA, the only alternative that meets the purpose and need of the project is the roundabout. Road repair beyond the scope of this project is being addressed through the Governor's Roads to Prosperity program and progress can be tracked via the WVDOH website.
715	The EA reported impacts to Federal Farmland Protection Policy Act (FPPA) soils. The entire Greenbag Road environmental study area is encompassed by “land already in or committed to urban development” as defined by the FPPA (see 7 CFR § 658.2 - Definitions) and is therefore not subject to provisions of FPPA. Please refer to the Farmland Appendix attached to the FONSI for further detail. Conscious Harvest Cooperative Community Garden, Joy and Hemp Universal LLC, and Mockingbird Hill Farms are located on private property and the property owner will be compensated for the sale of any land to the WVDOH during the right-of-way acquisition process. Impacts to this parcel have been minimized to the extent practicable. Approximately 1.56 acres (67,900 square feet) will be required from the parcel. Fair market value will be paid for all properties that require full or partial acquisition as a result of the project. When only part of the property is required, as is the case with this parcel, fair market value of the part taken will be paid, plus damages, if any, to the residue, less all benefits. West Virginia law defines “market value” as the price a willing buyer would pay a willing seller, neither acting under compulsion nor duress, both exercising prudence and intelligent judgment as to its value and familiar with the purpose for which the property is reasonably available. Fair market value will be determined by a competent, professional real estate appraiser after a thorough inspection of the property, a comparison with similar properties in the area that have been sold recently, a determination and consideration of its replacement cost and depreciation and consideration of the income-producing potential. All appraisal reports are office-reviewed, then rechecked in the field by experienced, qualified review appraisers for accuracy. Since the Division of Highways has adopted a firm price policy, the property owner will be offered the full amount of the approved appraisal. There will be no attempt to buy property at less than fair market value. This policy guarantees that all citizens of the state receive full value for the money expended for highway rights of way. Those who hold a valid property interest in the property that is acquired for the project will be compensated during the ROW acquisition phase.

	The table on page 239 of the PDF of the EA lists the hydric soils identified in the project area as listed on the NRCS State Soil Data Access Hydric Soils List. The Clarksburg soil series (CkC and CkB) are listed as hydric in Monongalia County. The Monongahela soil series is also listed as hydric in Monongalia County. The stormwater management plan for this project will meet the volume and rate requirements of the Morgantown Utility Board and WVDOH policies. Due to the existing topography and features it is likely that these requirements will require basins and other stormwater BMP's, such as vegetated swales. The amount of offsite runoff to the streams and wetlands will be minimized where practicable in order to limit basin size and meet the design criteria. Stormwater design for the project will be completed during final design and will minimize the impacts to the streams and wetlands located within and adjacent to the project right of way. The turn lane option proposed here was one of the options suggested by the MMMPO study (adding left turn lanes only on Greenbag Rd at the Dorsey/Kingwood Pike) and was included on the first round of traffic analysis submitted to the WVDOH in February of 2019. This scenario also included upgrading the existing 2-phase traffic signal to 3-phases to incorporate a protected/permissive left turn phase. Installation of the turn lanes and modifying the signal phasing resulted in various approach and overall intersection LOS improvements; however, LOS C or better for the overall intersection operation could not be achieved. It was projected that some movements and the overall intersection would operate at an unacceptable level of service (LOS E or F). During the PM peak hour, the overall intersection is projected to operate at an overall intersection LOS E, and the eastbound through movement is forecasted to operate at a LOS F. This option would result in the Greenbag Road and Dorsey Avenue approaches queue lengths increasing. The eastbound Greenbag Road through movement queue will continue to extend past the Bluegrass Village driveway. Based on these findings and at the direction of the WVDOH, the traffic analysis was revised using additional options, which developed into Options D and E examined for the EA. The left turn lane only on Greenbag Road was not developed further and no impacts were assessed for the EA. Indirect and cumulative effects were analyzed as part of the development of the EA. More information is available in the EA appendices. The EA and appendices are available on the WVDOH website: https://transportation.wv.gov/highways/engineering/comment/closed/greenbagroadimprovementproject/Pages/default.aspx.
716	The turn lane options that were examined do not improve the level of service as much as the roundabout at the intersection of Dorsey Avenue/Kingwood Pike. In addition, the turn lane option involves complete takes of 2 residences and 1 business. These takes are different from what was reported in the EA. This change will be noted in the FONSI. Adding only left turn lanes on Greenbag Road at the Dorsey/Kingwood Pike intersection was evaluated during an initial round of traffic analysis because this option had been suggested by the MPO. The option included upgrading the signal lights to have a protected/permissive left turn phase. The analysis showed that this option would result in some intersection improvements but could not achieve LOS C or better for the overall intersection operation. It should be noted that LOS C is WVDOH's design year level of service criteria threshold for intersection improvements. The overall intersection would operate at an

	unacceptable level of service (LOS E). In addition, the left turn lane option would result in the eastbound Greenbag Road traffic queue to extend past the Bluegrass Village Driveway. In regards to safety, a conventional 4-way intersection has 32 points of vehicle conflict due to vehicular maneuvers through the intersection. A roundabout has 8 points of vehicle conflict, which all occur in the same direction, reducing crash severity and likelihood of injury. Studies by the Federal Highway Administration (FHWA) have shown that roundabouts typically achieve reduction in overall collisions, injury collisions, fatality collisions, and pedestrian collisions. Reasons for these reductions due to the installation of a roundabout include: - Low travel speeds – Drivers must slow down and yield to traffic before entering a roundabout. The reduction in speeds results in a decrease in crash severity and injury. - No traffic light "to beat" – The design of a roundabout promotes a continuous circular flow of traffic. Because of this design, drivers will not have the incentive to speed up to "beat the light", like they may at a traditional intersection. - One way travel – The design of a roundabout directs drivers through gently designed curves into a one-way counterclockwise circular path. This design eliminates the possibilities for T-bone and head-on collisions. The roundabouts were designed to accommodate AASHTO WB-62 truck configuration, which is an interstate semi-truck with a 62' wheel base between steer axle and last trailer axle, including a 48' trailer. Larger trucks can navigate the roundabout and use the internal truck apron. The need for a sidewalk was identified by the public in the comments for the MMMPO corridor study as one of the factors to improve safety in the Greenbag Road corridor. Pedestrians should use the dedicated crosswalks when safely crossing, just like crossing any other intersection. At a roundabout, pedestrian crosswalks will be placed to cross each roadway leg to the roundabout, which is the same as traditional intersection crossings. The roundabout pedestrian crosswalk placement allows pedestrians to cross one direction of traffic a time at each roundabout approach because of the splitter island. Pedestrians should also use the designated crosswalk locations. Crossing to the center of the roundabout is not recommended. Conscious Harvest Cooperative Community Garden, Joy and Hemp Universal LLC, and Mockingbird Hill Farms are located on private property and the property owner will be compensated for the sale of any land to the WVDOH during the right-of-way acquisition process. Impacts to this parcel have been minimized to the extent practicable. Approximately 1.56 acres (67,900 square feet) will be required from the parcel. Fair market value will be paid for all properties that require full or partial acquisition as a result of the project. When only part of the property is required, as is the case with this parcel, fair market value of the part taken will be paid, plus damages, if any, to the residue, less all benefits. West Virginia law defines "market value" as the price a willing buyer would pay a willing seller, neither acting under compulsion nor duress, both exercising prudence and intelligent judgment as to its value and familiar with the purpose for which the property is reasonably available. Fair

	market value will be determined by a competent, professional real estate appraiser after a thorough inspection of the property, a comparison with similar properties in the area that have been sold recently, a determination and consideration of its replacement cost and depreciation and consideration of the income-producing potential. All appraisal reports are office-reviewed, then rechecked in the field by experienced, qualified review appraisers for accuracy. Since the Division of Highways has adopted a firm price policy, the property owner will be offered the full amount of the approved appraisal. There will be no attempt to buy property at less than fair market value. This policy guarantees that all citizens of the state receive full value for the money expended for highway rights of way. Those who hold a valid property interest in the property that is acquired for the project will be compensated during the ROW acquisition phase. Any property needed for the project will be acquired under the Uniform Relocation Assistance and Real Property Acquisition Act (1970) through negotiations with the landowners.
717	The proposed roundabouts on Greenbag are more straightforward and more traditional roundabout designs, without all of the confusing lanes that are sometimes present. The roundabouts on Greenbag Road will be more intuitive for drivers. The WVDOH has examined two build alternatives and three options for each of the major intersections. The WVDOH has an educational video on how to use a roundabout available for viewing at https://www.youtube.com/watch?v=7njH4MKyo0w. The intersection options that were evaluated and analyzed include turning lanes, traffic signals, and roundabouts. The turn lane options that were examined do not improve the level of service as much as the roundabout at the intersection of Dorsey Avenue/Kingwood Pike. In addition, the turn lane option involves complete takes of 2 residences and 1 business. These takes are different from what was reported in the EA. This change will be noted in the FONSI. Adding only left turn lanes on Greenbag Road at the Dorsey/Kingwood Pike intersection was evaluated during an initial round of traffic analysis because this option had been suggested by the MPO. The option included upgrading the signal lights to have a protected/permissive left turn phase. The analysis showed that this option would result in some intersection improvements but could not achieve LOS C or better for the overall intersection operation. It should be noted that LOS C is WVDOH's design year level of service criteria threshold for intersection improvements. The overall intersection would operate at an unacceptable level of service (LOS E). In addition, the left turn lane option would result in the eastbound Greenbag Road traffic queue to extend past the Bluegrass Village Driveway.
718	The traffic control plan, which will outline the intended traffic detour tour, will continue to be revised during final design. It should be noted that Aaron's Creek Road will not be utilized as a signed detour. The anticipated plan intends to utilize the center of the Dorsey Avenue /Kingwood Pike roundabout as a temporary intersection with temporary traffic signals during construction. A short-term detour is proposed using Summers School Road while constructing the connection of the existing Kingwood Pike with the new portion.

719	One of the major differences between Greenbag Road and the Mileground, is the volume of traffic. Greenbag Road has less than half the traffic volume that Mileground has. A second major difference is the general configuration of the roundabouts. The proposed roundabouts on Greenbag are more straightforward and more traditional roundabout designs, without all of the confusing lanes that are present at Mileground. The roundabouts on Greenbag Road will be more intuitive for drivers. Roundabouts help reduce the likelihood and severity of collisions. Studies by the Federal Highway Administration (FHWA) have shown that roundabouts typically achieve reduction in overall collisions, injury collisions, fatality collisions, and pedestrian collisions. Reasons for these reductions due to the installation of a roundabout include: Low travel speeds – Drivers must slow down and yield to traffic before entering a roundabout. The reduction in speeds results in a decrease in crash severity and injury. No traffic light "to beat" – The design of a roundabout promotes a continuous circular flow of traffic. Because of this design, drivers will not have the incentive to speed up to "beat the light", like they may at a traditional intersection. One way travel – The design of a roundabout directs drivers through gently designed curves into a one-way counterclockwise circular path. This design eliminates the possibilities for T-bone and head-on collisions. In addition, a conventional 4-way intersection has 32 points of vehicle conflict due to the different maneuvers through the intersection. A roundabout has 8 points of conflict, which all occur in the same direction, reducing crash severity and likelihood of injury. The WVDOH has produced an educational video on how to use a roundabout available for viewing at https://www.youtube.com/watch?v=7njH4MKyo0w.
720	The EA reported impacts to Federal Farmland Protection Policy Act (FPPA) soils. The entire Greenbag Road environmental study area is encompassed by "land already in or committed to urban development" as defined by the FPPA (see 7 CFR § 658.2 - Definitions) and is therefore not subject to provisions of FPPA. Please refer to the Farmland Appendix attached to the FONSI for further detail. The property owner will be compensated for the sale of any land to the WVDOH during the right-of-way acquisition process. Impacts to this parcel have been minimized to the extent practicable. Approximately 1.56 acres (67,900 square feet) will be required from the parcel. Fair market value will be paid for all properties that require full or partial acquisition as a result of the project. When only part of the property is required, as is the case with this parcel, fair market value of the part taken will be paid, plus damages, if any, to the residue, less all benefits. West Virginia law defines "market value" as the price a willing buyer would pay a willing seller, neither acting under compulsion nor duress, both

	exercising prudence and intelligent judgment as to its value and familiar with the purpose for which the property is reasonably available. Fair market value will be determined by a competent, professional real estate appraiser after a thorough inspection of the property, a comparison with similar properties in the area that have been sold recently, a determination and consideration of its replacement cost and depreciation and consideration of the income-producing potential. All appraisal reports are office-reviewed, then rechecked in the field by experienced, qualified review appraisers for accuracy. Since the Division of Highways has adopted a firm price policy, the property owner will be offered the full amount of the approved appraisal. There will be no attempt to buy property at less than fair market value. This policy guarantees that all citizens of the state receive full value for the money expended for highway rights of way. Those who hold a valid property interest in the property that is acquired for the project will be compensated during the ROW acquisition phase. The noise analysis report indicates the Greenbag Road and intersection improvements for this alternative do not meet the requirements for either a Type I or Type II project. The Project is classified as a Type III project and a detailed noise analysis for highway traffic noise impacts was not required. The Type III noise analysis is available as an Appendix to the EA on the WVDOH website at https://transportation.wv.gov/highways/engineering/comment/closed/greenbagroadimprovementproject/Pages/default.aspx. The proposed project includes improvements to an existing transportation facility and the construction of the project is not expected to stimulate secondary growth, affect land use decisions, or induce land use change. Therefore, the project is not expected to result in light pollution impacts that are significantly worse than conditions currently present within the project area. The lighting layout for the roundabout will be developed during final design. The lighting will be designed to attempt to minimize light pollution while maintaining FHWA and WVDOH standards and requirements for lighting of the roundabout.
721	We appreciate your input regarding the project. Changes to the interstate access in Morgantown are beyond the scope of the current project.
722	A shared-use path was part of some early versions of the project, but the right of way impacts along Bluegrass Village and the Kennedy Center were significant. Due to these detrimental impacts the shared use path was removed from the alternatives that were advanced to the EA. The sidewalk design has been extended from the western end of the project area along Greenbag Road to the Dorsey Avenue/Kingwood Pike intersection. At the intersection the sidewalk follows Dorsey Avenue north to Luckey Lane and east on Luckey Lane to the connection with the existing sidewalk at Mountainview Elementary School. The shoulder along the north side of Greenbag Road is being designed to accommodate bicycle use by being wider (3 feet) than the standard shoulder (2 feet). The design speed of 35 mph was not considered during the Greenbag Road PIE Traffic Study. The posted speed limit along Greenbag Road within the study area is 40 mph. Automatic traffic recorder (ATR) counts were conducted on various segments of Greenbag Road throughout the study area. The ATR counts recorded the 85th percentile speeds, which is the speed at or below which 85 percent of the motorists drive.

	The recorded speeds obtained during the September 2018 – October 2018 counts indicate that most traffic is traveling at or below 45 mph. It is anticipated that a reduction of the posted speed limit to 35 mph would have minimal impact to the current traveling speeds along Greenbag Road. The turn lane options that were examined do not improve the level of service as much as the roundabout at the intersection of Dorsey Avenue/Kingwood Pike. In addition, the turn lane option involves complete takes of 2 residences and 1 business. These takes are different from what was reported in the EA. This change will be noted in the FONSI. Adding only left turn lanes on Greenbag Road at the Dorsey/Kingwood Pike intersection was evaluated during an initial round of traffic analysis because this option had been suggested by the MPO. The option included upgrading the signal lights to have a protected/permissive left turn phase. The analysis showed that this option would result in some intersection improvements but could not achieve LOS C or better for the overall intersection operation. It should be noted that LOS C is WVDOH's design year level of service criteria threshold for intersection improvements. The overall intersection would operate at an unacceptable level of service (LOS E). In addition, the left turn lane option would result in the eastbound Greenbag Road traffic queue to extend past the Bluegrass Village Driveway. Conscious Harvest Cooperative Community Garden, Joy and Hemp Universal LLC, and Mockingbird Hill Farms are located on private property and the property owner will be compensated for the sale of any land to the WVDOH during the right-of-way acquisition process. Impacts to this parcel have been minimized to the extent practicable. Approximately 1.56 acres (67,900 square feet) will be required from the parcel. Fair market value will be paid for all properties that require full or partial acquisition as a result of the project. When only part of the property is required, as is the case with this parcel, fair market value of the part taken will be paid, plus damages, if any, to the residue, less all benefits. West Virginia law defines "market value" as the price a willing buyer would pay a willing seller, neither acting under compulsion nor duress, both exercising prudence and intelligent judgment as to its value and familiar with the purpose for which the property is reasonably available. Fair market value will be determined by a competent, professional real estate appraiser after a thorough inspection of the property, a comparison with similar properties in the area that have been sold recently, a determination and consideration of its replacement cost and depreciation and consideration of the income-producing potential. All appraisal reports are office-reviewed, then rechecked in the field by experienced, qualified review appraisers for accuracy. Since the Division of Highways has adopted a firm price policy, the property owner will be offered the full amount of the approved appraisal. There will be no attempt to buy property at less than fair market value. This policy guarantees that all citizens of the state receive full value for the money expended for highway rights of way. Those who hold a valid property interest in the property that is acquired for the project will be compensated during the ROW acquisition phase.

723	The EA reviewed multiple alternatives including turn lanes, traffic lights, and the roundabouts. Through the analysis in the EA, the only alternative that meets the purpose and need of the project is the roundabout. The preliminary investigation and engineering traffic study was completed to evaluate the Greenbag Road corridor, evaluating the existing and potential future operation of the intersections selected for study by WVDOH. The evaluation of existing roadway conditions, including the existing roadway conditions of Kingwood Pike, was not part of the preliminary investigation and engineering traffic study. The Greenbag Road corridor has long been recognized as a challenging roadway to navigate due to geometric deficiencies, significant intersection delays during the peak hours, and increased volume of truck traffic and development within the corridor. Several studies have been previously completed through the MMMPO, evaluating various transportation plans for the Greenbag Road corridor, with the ultimate vision of transforming Greenbag Road into a safe, efficient, and attractive multimodal transportation facility. The future traffic along Greenbag Road, Mississippi Avenue, Dorsey Avenue, Kingwood Pike were projected for the future design year by assuming existing traffic distribution/patterns but with increased traffic volumes though application of a yearly traffic growth rate of 1.16% per year. It should be noted that the traffic evaluation was completed prior to the COVID-19 pandemic and its effects to traffic currently occurring. The turn lane options that were examined do not improve the level of service as much as the roundabout and the turn lanes at Dorsey Avenue/Kingwood Pike involve complete takes of 2 residences and 1 business. These takes are different from what was reported in the EA. This change will be noted in the FONSI. Adding only left turn lanes on Greenbag Road at the Dorsey/Kingwood Pike intersection was evaluated during an initial round of traffic analysis because this option had been suggested by the MPO. The option included upgrading the signal lights to have a protected/permissive left turn phase. The analysis showed that this option would result in some intersection improvements but could not achieve LOS C or better for the overall intersection operation. The overall intersection would operate at an unacceptable LOS (LOS E or F). The eastbound Greenbag Road traffic queue would extend past the Bluegrass Village Driveway. Based on these findings this option was replaced with Options D and E for the EA analysis.
724	The EA reviewed multiple alternatives including turn lanes, traffic lights, and the roundabouts. Through the analysis in the EA, the only alternative that meets the purpose and need of the project is the roundabout. The turn lane options that were examined do not improve the level of service as much as the roundabout and the turn lanes at Dorsey Avenue/Kingwood Pike involve complete takes of 2 residences and 1 business. These takes are different from what was reported in the EA. This change will be noted in the FONSI. Adding only left turn lanes on Greenbag Road at the Dorsey/Kingwood Pike intersection was evaluated during an initial round of traffic analysis because this option had been suggested by the MPO. The option included upgrading the signal lights to have a protected/permissive left turn phase. The analysis showed that this option would result in some intersection improvements but could not achieve LOS C or better for the overall intersection operation. The overall intersection would operate at an unacceptable LOS (LOS E or F).

	The eastbound Greenbag Road traffic queue would extend past the Bluegrass Village Driveway. Based on these findings this option was replaced with Options D and E for the EA analysis. The traffic control plan will continue to be revised during final design, and will not use Aaron's Creek Road as a signed detour. The revised plan intends to utilize the center of the Dorsey/Kingwood roundabout as a temporary intersection with temporary traffic signals. A short-term detour is proposed using Summers School Road while constructing the connection of the existing Kingwood Pike with the new portion. One of the major differences between Greenbag Road and the Mileground, is the volume of traffic. Greenbag Road has less than half the traffic volume that Mileground has. A second major difference is the general configuration of the roundabouts. The proposed roundabouts on Greenbag are more straightforward and more traditional roundabout designs, without all of the confusing lanes that are present at Mileground. The roundabouts on Greenbag Road will be more intuitive for drivers. The roundabouts were designed to accommodate AASHTO WB-62 truck configuration, which is an interstate semi-truck with a 62' wheel base between steer axle and last trailer axle, including a 48' trailer. Larger trucks can navigate the roundabout and use the internal truck apron. The EA reported impacts to Federal Farmland Protection Policy Act (FPPA) soils. The entire Greenbag Road environmental study area is encompassed by "land already in or committed to urban development" as defined by the FPPA (see 7 CFR § 658.2 - Definitions) and is therefore not subject to provisions of FPPA. Please refer to the Farmland Appendix attached to the FONSI for further detail. Conscious Harvest Cooperative Community Garden, Joy and Hemp Universal LLC, and Mockingbird Hill Farms are located on private property and the property owner will be compensated for the sale of any land to the WVDOH during the right-of-way acquisition process. Impacts to this parcel have been minimized to the extent practicable. Approximately 1.56 acres (67,900 square feet) will be required from the parcel. Fair market value will be paid for all properties that require full or partial acquisition as a result of the project. When only part of the property is required, as is the case with this parcel, fair market value of the part taken will be paid, plus damages, if any, to the residue, less all benefits. West Virginia law defines "market value" as the price a willing buyer would pay a willing seller, neither acting under compulsion nor duress, both exercising prudence and intelligent judgment as to its value and familiar with the purpose for which the property is reasonably available. Fair market value will be determined by a competent, professional real estate appraiser after a thorough inspection of the property, a comparison with similar properties in the area that have been sold recently, a determination and consideration of its replacement cost and depreciation and consideration of the income-producing potential. All appraisal reports are office-reviewed, then rechecked in the field by experienced, qualified review appraisers for accuracy. Since the Division of Highways has adopted a firm price policy, the property owner will be offered the full amount of the approved appraisal. There will be no attempt to buy property at less than fair market value. This policy guarantees that all citizens of the state receive full value for the money expended for highway rights of way.

	Those who hold a valid property interest in the property that is acquired for the project will be compensated during the ROW acquisition phase. The EA reported impacts to Federal Farmland Protection Policy Act (FPPA) soils. The entire Greenbag Road environmental study area is encompassed by "land already in or committed to urban development" as defined by the FPPA (see 7 CFR § 658.2 - Definitions) and is therefore not subject to provisions of FPPA. Please refer to the Farmland Appendix attached to the FONSI for further detail.
725	The EA reviewed multiple alternatives including turn lanes, traffic lights, and the roundabouts. Through the analysis in the EA, the only alternative that meets the purpose and need of the project is the roundabout. The traffic control plan will continue to be revised during final design and will not use Aaron's Creek Road as a signed detour. The revised plan intends to utilize the center of the Dorsey/Kingwood roundabout as a temporary intersection with temporary traffic signals. A short-term detour is proposed using Summers School Road while constructing the connection of the existing Kingwood Pike with the new portion. The turn lane options that were examined do not improve the level of service as much as the roundabout and the turn lanes at Dorsey Avenue/Kingwood Pike involve complete takes of 2 residences and 1 business. These takes are different from what was reported in the EA. This change will be noted in the FONSI. Adding only left turn lanes on Greenbag Road at the Dorsey/Kingwood Pike intersection was evaluated during an initial round of traffic analysis because this option had been suggested by the MPO. The option included upgrading the signal lights to have a protected/permissive left turn phase. The analysis showed that this option would result in some intersection improvements but could not achieve LOS C or better for the overall intersection operation. The overall intersection would operate at an unacceptable LOS (LOS E or F). The eastbound Greenbag Road traffic queue would extend past the Bluegrass Village Driveway. Based on these findings this option was replaced with Options D and E for the EA analysis. Roundabouts help reduce the likelihood and severity of collisions. Studies by the Federal Highway Administration (FHWA) have shown that roundabouts typically achieve reduction in overall collisions, injury collisions, fatality collisions, and pedestrian collisions. Reasons for these reductions due to the installation of a roundabout include: Low travel speeds – Drivers must slow down and yield to traffic before entering a roundabout. The reduction in speeds results in a decrease in crash severity and injury. No traffic light "to beat" – The design of a roundabout promotes a continuous circular flow of traffic. Because of this design, drivers will not have the incentive to speed up to "beat the light", like they may at a traditional intersection.

	One way travel – The design of a roundabout directs drivers through gently designed curves into a one-way counterclockwise circular path. This design eliminates the possibilities for T-bone and head-on collisions. In addition, a conventional 4-way intersection has 32 points of vehicle conflict due to the different maneuvers through the intersection. A roundabout has 8 points of conflict, which all occur in the same direction, reducing crash severity and likelihood of injury. The EA reported impacts to Federal Farmland Protection Policy Act (FPPA) soils. The entire Greenbag Road environmental study area is encompassed by "land already in or committed to urban development" as defined by the FPPA (see 7 CFR § 658.2 - Definitions) and is therefore not subject to provisions of FPPA. Please refer to the Farmland Appendix attached to the FONSI for further detail.
726	We appreciate your input regarding the project.
727	The EA reported impacts to Federal Farmland Protection Policy Act (FPPA) soils. The entire Greenbag Road environmental study area is encompassed by "land already in or committed to urban development" as defined by the FPPA (see 7 CFR § 658.2 - Definitions) and is therefore not subject to provisions of FPPA. Please refer to the Farmland Appendix attached to the FONSI for further detail. Conscious Harvest Cooperative Community Garden, Joy and Hemp Universal LLC, and Mockingbird Hill Farms are located on private property and the property owner will be compensated for the sale of any land to the WVDOH during the right-of-way acquisition process. Impacts to this parcel have been minimized to the extent practicable. Approximately 1.56 acres (67,900 square feet) will be required from the parcel. Fair market value will be paid for all properties that require full or partial acquisition as a result of the project. When only part of the property is required, as is the case with this parcel, fair market value of the part taken will be paid, plus damages, if any, to the residue, less all benefits. West Virginia law defines "market value" as the price a willing buyer would pay a willing seller, neither acting under compulsion nor duress, both exercising prudence and intelligent judgment as to its value and familiar with the purpose for which the property is reasonably available. Fair market value will be determined by a competent, professional real estate appraiser after a thorough inspection of the property, a comparison with similar properties in the area that have been sold recently, a determination and consideration of its replacement cost and depreciation and consideration of the income-producing potential. All appraisal reports are office-reviewed, then rechecked in the field by experienced, qualified review appraisers for accuracy. Since the Division of Highways has adopted a firm price policy, the property owner will be offered the full amount of the approved appraisal. There will be no attempt to buy property at less than fair market value. This policy guarantees that all citizens of the state receive full value for the money expended for highway rights of way. Those who hold a valid property interest in the property that is acquired for the project will be compensated during the ROW acquisition phase.

	The turn lane options that were examined do not improve the level of service as much as the roundabout and the turn lanes at Dorsey Avenue/Kingwood Pike involve complete takes of 2 residences and 1 business. These takes are different from what was reported in the EA. This change will be noted in the FONSI. Adding only left turn lanes on Greenbag Road at the Dorsey/Kingwood Pike intersection was evaluated during an initial round of traffic analysis because this option had been suggested by the MPO. The option included upgrading the signal lights to have a protected/permissive left turn phase. The analysis showed that this option would result in some intersection improvements but could not achieve LOS C or better for the overall intersection operation. The overall intersection would operate at an unacceptable LOS (LOS E or F). The eastbound Greenbag Road traffic queue would extend past the Bluegrass Village Driveway. Based on these findings this option was replaced with Options D and E for the EA analysis. Roundabouts help reduce the likelihood and severity of collisions. Studies by the Federal Highway Administration (FHWA) have shown that roundabouts typically achieve reduction in overall collisions, injury collisions, fatality collisions, and pedestrian collisions. Reasons for these reductions due to the installation of a roundabout include: Low travel speeds – Drivers must slow down and yield to traffic before entering a roundabout. The reduction in speeds results in a decrease in crash severity and injury. No traffic light “to beat” – The design of a roundabout promotes a continuous circular flow of traffic. Because of this design, drivers will not have the incentive to speed up to “beat the light”, like they may at a traditional intersection. One way travel – The design of a roundabout directs drivers through gently designed curves into a one-way counterclockwise circular path. This design eliminates the possibilities for T-bone and head-on collisions. In addition, a conventional 4-way intersection has 32 points of vehicle conflict due to the different maneuvers through the intersection. A roundabout has 8 points of conflict, which all occur in the same direction, reducing crash severity and likelihood of injury. The traffic control plan will continue to be revised during final design, and will not use Aaron’s Creek Road as a signed detour. The revised plan intends to utilize the center of the Dorsey/Kingwood roundabout as a temporary intersection with temporary traffic signals. A short-term detour is proposed using Summers School Road while constructing the connection of the existing Kingwood Pike with the new portion. Lastly, long-term costs associated with roundabouts are significantly less than a traffic signal, since no electrical costs and no traffic signal maintenance costs are involved with a roundabout.

728	Both the MMMPO corridor study and the 2018 traffic study determined that traffic flow through the corridor is controlled by the congestion at the major intersections in the corridor. The projected growth in the Morgantown area will continue to increase traffic and congestion at the intersections if improvements do not occur. Road repair beyond the scope of this project is being addressed through the Governor's Roads to Prosperity program and progress can be tracked via the WVDOH website. The EA reported impacts to Federal Farmland Protection Policy Act (FPPA) soils. The entire Greenbag Road environmental study area is encompassed by "land already in or committed to urban development" as defined by the FPPA (see 7 CFR § 658.2 - Definitions) and is therefore not subject to provisions of FPPA. Please refer to the Farmland Appendix attached to the FONSI for further detail. Conscious Harvest Cooperative Community Garden, Joy and Hemp Universal LLC, and Mockingbird Hill Farms are located on private property and the property owner will be compensated for the sale of any land to the WVDOH during the right-of-way acquisition process. Impacts to this parcel have been minimized to the extent practicable. Approximately 1.56 acres (67,900 square feet) will be required from the parcel. Fair market value will be paid for all properties that require full or partial acquisition as a result of the project. West Virginia law defines "market value" as the price a willing buyer would pay a willing seller, neither acting under compulsion nor duress, both exercising prudence and intelligent judgment as to its value and familiar with the purpose for which the property is reasonably available. Fair market value will be determined by a competent, professional real estate appraiser after a thorough inspection of the property, a comparison with similar properties in the area that have been sold recently, a determination and consideration of its replacement cost and depreciation and consideration of the income-producing potential. All appraisal reports are office-reviewed, then rechecked in the field by experienced, qualified review appraisers for accuracy. Since the Division of Highways has adopted a firm price policy, the property owner will be offered the full amount of the approved appraisal. There will be no attempt to buy property at less than fair market value. This policy guarantees that all citizens of the state receive full value for the money expended for highway rights of way. Those who hold a valid property interest in the property that is acquired for the project will be compensated during the ROW acquisition phase.
729	The traffic control plan will continue to be revised during final design, and will not use Aaron's Creek Road as a signed detour. The revised plan intends to utilize the center of the Dorsey/Kingwood roundabout as a temporary intersection with temporary traffic signals. A short-term detour is proposed using Summers School Road while constructing the connection of the existing Kingwood Pike with the new portion. Roundabouts are designed to maintain a constant flow of traffic through the intersection which results in reduced congestion on roadways and a reduction in delays for drivers. Studies have shown that changing signalized intersections to roundabouts can have up to an 89% average

	reduction in vehicle delays. The improved traffic flow also results in reduced vehicle emissions including carbon monoxide, nitrous oxide, and carbon dioxide at the intersection. Additionally, roundabouts are designed to slow speeds in the approach and through the roundabout allowing drivers more response time and limiting the number of potential directions where traffic could approach.
730	The preliminary investigation and engineering traffic study was completed to evaluate the Greenbag Road corridor, evaluating the existing and potential future operation of the intersections selected for study by WVDOH. The Greenbag Road corridor has long been recognized as a challenging roadway to navigate due to geometric deficiencies, significant intersection delays during the peak hours, and increased volume of truck traffic and development within the corridor. Several studies have been previously completed through the MMMPO, evaluating various transportation plans for the Greenbag Road corridor, with the ultimate vision of transforming Greenbag Road into a safe, efficient, and attractive multimodal transportation facility. It should be noted that the traffic evaluation was completed prior to the COVID-19 pandemic and its effects to traffic currently occurring. The traffic study has examined two build alternatives and three options for each of the major intersections. The intersection options that were evaluated and analyzed include turning lanes, traffic signals, and roundabouts. WVDOH requires intersection improvements to meet or exceed an overall intersection LOS C or better during the peak hours studied for design year improvements. The times of day (peak hours) selected to be studied followed WVDOH guidelines and is standard traffic engineering practice for determining future intersection improvements. Through the analysis in the EA, the only alternative that meets the purpose and need of the project is the roundabout. Roundabouts are designed to maintain a constant flow of traffic through the intersection which results in reduced congestion on roadways and a reduction in delays for drivers. Studies have shown that changing signalized intersections to roundabouts can have up to an 89% average reduction in vehicle delays. The improved traffic flow also results in reduced vehicle emissions including carbon monoxide, nitrous oxide, and carbon dioxide at the intersection. Additionally, roundabouts are designed to slow speeds in the approach and through the roundabout allowing drivers more response time and limiting the number of potential directions where traffic could approach.
731	The diversion of traffic from downtown, including large trucks, is not within the scope of this project. The roundabouts were designed to accommodate AASHTO WB-62 truck configuration, which is an interstate semi-truck with a 62’ wheel base between steer axle and last trailer axle, including a 48’ trailer. Larger trucks can navigate the roundabout and use the internal truck apron. Roundabouts help reduce the likelihood and severity of collisions. Studies by the Federal Highway Administration (FHWA) have shown that roundabouts typically achieve reduction in overall collisions, injury collisions, fatality collisions, and pedestrian collisions. Reasons for these reductions due to the installation of a roundabout include:

	Low travel speeds – Drivers must slow down and yield to traffic before entering a roundabout. The reduction in speeds results in a decrease in crash severity and injury. No traffic light "to beat" – The design of a roundabout promotes a continuous circular flow of traffic. Because of this design, drivers will not have the incentive to speed up to "beat the light", like they may at a traditional intersection. One way travel – The design of a roundabout directs drivers through gently designed curves into a one-way counterclockwise circular path. This design eliminates the possibilities for T-bone and head-on collisions. In addition, a conventional 4-way intersection has 32 points of vehicle conflict due to the different maneuvers through the intersection. A roundabout has 8 points of conflict, which all occur in the same direction, reducing crash severity and likelihood of injury. The sidewalk design has been extended from the western end of the project area along Greenbag Road to the Dorsey Avenue/Kingwood Pike intersection. At the intersection the sidewalk follows Dorsey Avenue north to Luckey Lane and east on Luckey Lane to the connection with the existing sidewalk at Mountainview Elementary School. The shoulder along the north side of Greenbag Road is being designed to accommodate bicycle use by being wider (3 feet) than the standard shoulder (2 feet). Pedestrians should use the dedicated crosswalks when safely crossing, just like crossing any other intersection. At a roundabout, pedestrian crosswalks will be placed to cross each roadway leg to the roundabout, which is the same as traditional intersection crossings. The roundabout pedestrian crosswalk placement allows pedestrians to cross one direction of traffic a time at each roundabout approach because of the splitter island. Pedestrians should also use the designated crosswalk locations. The turn lane options that were examined do not improve the level of service as much as the roundabout and the turn lanes at Dorsey Avenue/Kingwood Pike involve complete takes of 2 residences and 1 business. These takes are different from what was reported in the EA. This change will be noted in the FONSI. Adding only left turn lanes on Greenbag Road at the Dorsey/Kingwood Pike intersection was evaluated during an initial round of traffic analysis because this option had been suggested by the MPO. The option included upgrading the signal lights to have a protected/permissive left turn phase. The analysis showed that this option would result in some intersection improvements but could not achieve LOS C or better for the overall intersection operation. The overall intersection would operate at an unacceptable LOS (LOS E or F). The eastbound Greenbag Road traffic queue would extend past the Bluegrass Village Driveway. Based on these findings this option was replaced with Options D and E for the EA analysis.
732	The preliminary investigation and engineering traffic study was completed to evaluate the Greenbag Road corridor, evaluating the existing and potential future operation of the intersections selected for study by WVDOH. The Greenbag Road corridor has long been recognized as a challenging roadway to navigate due to geometric deficiencies, significant intersection delays during the peak hours, and increased volume of

	truck traffic and development within the corridor. Several studies have been previously completed through the MMMPO, evaluating various transportation plans for the Greenbag Road corridor, with the ultimate vision of transforming Greenbag Road into a safe, efficient, and attractive multimodal transportation facility. It should be noted that the traffic evaluation was completed prior to the COVID-19 pandemic and its effects to traffic currently occurring. The traffic study has examined two build alternatives and three options for each of the major intersections. The intersection options that were evaluated and analyzed include turning lanes, traffic signals, and roundabouts. WVDOH requires intersection improvements to meet or exceed an overall intersection LOS C or better during the peak hours studied for design year improvements. The times of day (peak hours) selected to be studied followed WVDOH guidelines and is standard traffic engineering practice for determining future intersection improvements. Through the analysis in the EA, the only alternative that meets the purpose and need of the project is the roundabout. Roundabouts are designed to maintain a constant flow of traffic through the intersection which results in reduced congestion on roadways and a reduction in delays for drivers. Studies have shown that changing signalized intersections to roundabouts can have up to an 89% average reduction in vehicle delays. The improved traffic flow also results in reduced vehicle emissions including carbon monoxide, nitrous oxide, and carbon dioxide at the intersection. Additionally, roundabouts are designed to slow speeds in the approach and through the roundabout allowing drivers more response time and limiting the number of potential directions where traffic could approach.
733	The EA reported impacts to Federal Farmland Protection Policy Act (FPPA) soils. The entire Greenbag Road environmental study area is encompassed by “land already in or committed to urban development” as defined by the FPPA (see 7 CFR § 658.2 - Definitions) and is therefore not subject to provisions of FPPA. Please refer to the Farmland Appendix attached to the FONSI for further detail. Conscious Harvest Cooperative Community Garden, Joy and Hemp Universal LLC, and Mockingbird Hill Farms are located on private property and the property owner will be compensated for the sale of any land to the WVDOH during the right-of-way acquisition process. Impacts to this parcel have been minimized to the extent practicable. Approximately 1.56 acres (67,900 square feet) will be required from the parcel. Fair market value will be paid for all properties that require full or partial acquisition as a result of the project. When only part of the property is required, as is the case with this parcel, fair market value of the part taken will be paid, plus damages, if any, to the residue, less all benefits. West Virginia law defines “market value” as the price a willing buyer would pay a willing seller, neither acting under compulsion nor duress, both exercising prudence and intelligent judgment as to its value and familiar with the purpose for which the property is reasonably available. Fair market value will be determined by a competent, professional real estate appraiser after a thorough inspection of the property, a comparison with similar properties in the area that have been sold recently, a determination and consideration of its replacement cost and depreciation and consideration of the income-producing potential. All appraisal reports are office-reviewed, then rechecked in the field by experienced, qualified review appraisers for accuracy. Since the Division of Highways has adopted a firm price policy, the property owner will be offered the full

	amount of the approved appraisal. There will be no attempt to buy property at less than fair market value. This policy guarantees that all citizens of the state receive full value for the money expended for highway rights of way. Those who hold a valid property interest in the property that is acquired for the project will be compensated during the ROW acquisition phase. The preliminary investigation and engineering traffic study has examined two build alternatives and three options for each of the major intersections. The intersection options that were evaluated and analyzed include turning lanes, traffic signals, and roundabouts. WVDOH requires intersection improvements to meet or exceed an overall intersection LOS C or better during the peak hours studied for design year improvements. The times of day (peak hours) selected to be studied followed WVDOH guidelines and is standard traffic engineering practice for determining future intersection improvements. At the intersection of Greenbag Road/Dorsey Avenue/Kingwood Pike the traffic analysis determined that the intersection would operate at failure (overall intersection LOS F) if existing intersection conditions and operations were to remain the same 30-years in the future (design year) without any improvements. Adding only left turn lanes on Greenbag Road at the Dorsey/Kingwood Pike intersection was evaluated during an initial round of traffic analysis because this option had been suggested by the MPO. The option included upgrading the signal lights to have a protected/permissive left turn phase. The analysis showed that this option would result in some intersection improvements but could not achieve LOS C or better for the overall intersection operation. The overall intersection would operate at an unacceptable LOS (LOS E). In addition, the left turn lane option would result in the eastbound Greenbag Road traffic queue to extend past the Bluegrass Village Driveway. The traffic analysis determined that with installation of a roundabout the overall intersection would operate at a LOS C, meeting WVDOH design year criteria. At the intersection of Greenbag Road/Mississippi Avenue the traffic analysis determined that the intersection would operate at failure (overall intersection LOS F) if existing intersection conditions and operations were to remain the same 30-years in the future (design year) without any improvements. The design year with improvements scenarios evaluated determined that with installation of a roundabout the overall intersection would operate at a LOS A, best operating conditions, for all peak hours studied. Installation of a traffic signal with turn lanes resulted in an overall intersection LOS B during the AM peak hour, with the Mississippi Avenue approach operating at a LOS C. Though the analysis meets WVDOH minimum LOS criteria, the roundabout option exceeds WVDOH minimum LOS criteria. Roundabouts help reduce vehicular delay and promotes a continuous flow of traffic, which increases traffic capacity at an intersection. The roundabouts have been designed with larger vehicles in mind and incorporate truck aprons to support the weight and turning radius of larger vehicles, including school buses. In addition, roundabouts help reduce the likelihood and severity of collisions. Studies by the Federal

	Highway Administration (FHWA) have shown that roundabouts typically achieve reduction in overall collisions, injury collisions, fatality collisions, and pedestrian collisions. Reasons for these reductions due to the installation of a roundabout include: - Low travel speeds – Drivers must slow down and yield to traffic before entering a roundabout. The reduction in speeds results in a decrease in crash severity and injury. - No traffic light "to beat" – The design of a roundabout promotes a continuous circular flow of traffic. Because of this design, drivers will not have the incentive to speed up to "beat the light", like they may at a traditional intersection. - One way travel – The design of a roundabout directs drivers through gently designed curves into a one-way counterclockwise circular path. This design eliminates the possibilities for T-bone and head-on collisions. In addition, a conventional 4-way intersection has 32 points of vehicle conflict due to the different crossings and maneuvers through the intersection. A roundabout has 8 points of conflict, which all occur in the same direction, reducing crash severity and likelihood of injury. Lastly, long-term costs associated with roundabouts are significantly less than a traffic signal, since no electrical costs and no traffic signal maintenance costs are involved with a roundabout. The sidewalk design has been extended from the western end of the project area along Greenbag Road to the Dorsey Avenue/Kingwood Pike intersection. At the intersection the sidewalk follows Dorsey Avenue north to Luckey Lane and east on Luckey Lane to the connection with the existing sidewalk at Mountainview Elementary School. The shoulder along the north side of Greenbag Road is being designed to accommodate bicycle use by being wider (3 feet) than the standard shoulder (2 feet). Pedestrians should use the dedicated crosswalks when safely crossing, just like crossing any other intersection. At a roundabout, pedestrian crosswalks will be placed to cross each roadway leg to the roundabout, which is the same as traditional intersection crossings. The roundabout pedestrian crosswalk placement allows pedestrians to cross one direction of traffic a time at each roundabout approach because of the splitter island. Pedestrians should also use the designated crosswalk locations. The use of crossing guards is outside the scope of the WVDOH.
734	The traffic control plan, which will outline the intended traffic detour tour, will continue to be revised during final design. It should be noted that Aaron's Creek Road will not be utilized as a signed detour. The anticipated plan intends to utilize the center of the Dorsey Avenue /Kingwood Pike roundabout as a temporary intersection with temporary traffic signals during construction. A short-term detour is proposed using Summers School Road while constructing the connection of the existing Kingwood Pike with the new portion.

735	The EA reviewed multiple alternatives including turn lanes, traffic lights, and the roundabouts. Through the analysis in the EA, the only alternative that meets the purpose and need of the project is the roundabout. The traffic control plan, which will outline the intended traffic detour tour, will continue to be revised during final design. It should be noted that Aaron's Creek Road will not be utilized as a signed detour. The anticipated plan intends to utilize the center of the Dorsey Avenue /Kingwood Pike roundabout as a temporary intersection with temporary traffic signals during construction. A short-term detour is proposed using Summers School Road while constructing the connection of the existing Kingwood Pike with the new portion.
736	The traffic control plan, which will outline the intended traffic detour tour, will continue to be revised during final design. It should be noted that Aaron's Creek Road will not be utilized as a signed detour. The anticipated plan intends to utilize the center of the Dorsey Avenue /Kingwood Pike roundabout as a temporary intersection with temporary traffic signals during construction. A short-term detour is proposed using Summers School Road while constructing the connection of the existing Kingwood Pike with the new portion. The EA reviewed multiple alternatives including turn lanes, traffic lights, and the roundabouts. Through the analysis in the EA, the only alternative that meets the purpose and need of the project is the roundabout. One of the major differences between Greenbag Road and the Mileground, is the volume of traffic. Greenbag Road has less than half the traffic volume that Mileground has. A second major difference is the general configuration of the roundabouts. The proposed roundabouts on Greenbag are more straightforward and more traditional roundabout designs, without all of the confusing lanes that are present at Mileground. The roundabouts on Greenbag Road will be more intuitive for drivers.
737	The traffic control plan, which will outline the intended traffic detour tour, will continue to be revised during final design. It should be noted that Aaron's Creek Road will not be utilized as a signed detour. The anticipated plan intends to utilize the center of the Dorsey Avenue /Kingwood Pike roundabout as a temporary intersection with temporary traffic signals during construction. A short-term detour is proposed using Summers School Road while constructing the connection of the existing Kingwood Pike with the new portion. The virtual meeting was advertised in the WV legal ads, on a message board in the project area, and through the Morgantown Monongalia MPO. Emails were sent to all commenters from the April 2019 meeting who had provided a valid email address and postcards were mailed to all commenters from the April 2019 meeting who had provided a complete mailing address.
738	The traffic control plan will continue to be revised during final design, and will not use Aaron's Creek Road as a signed detour. The revised plan intends to utilize the center of the Dorsey/Kingwood roundabout as a temporary intersection with temporary traffic signals. A short-term detour

	is proposed using Summers School Road while constructing the connection of the existing Kingwood Pike with the new portion. Coordination with emergency services will occur during the finalization of the traffic control plan in final design. The EA reviewed multiple alternatives including turn lanes, traffic lights, and the roundabouts. Through the analysis in the EA, the only alternative that meets the purpose and need of the project is the roundabout. The turn lane options that were examined do not improve the level of service as much as the roundabout and the turn lanes at Dorsey Avenue/Kingwood Pike involve complete takes of 2 residences and 1 business. These takes are different from what was reported in the EA. This change will be noted in the FONSI. Adding only left turn lanes on Greenbag Road at the Dorsey/Kingwood Pike intersection was evaluated during an initial round of traffic analysis because this option had been suggested by the MPO. The option included upgrading the signal lights to have a protected/permissive left turn phase. The analysis showed that this option would result in some intersection improvements but could not achieve LOS C or better for the overall intersection operation. The overall intersection would operate at an unacceptable LOS (LOS E or F). The eastbound Greenbag Road traffic queue would extend past the Bluegrass Village Driveway. Based on these findings this option was replaced with Options D and E for the EA analysis.
739	The traffic control plan will continue to be revised during final design, and will not use Aaron's Creek Road as a signed detour. The revised plan intends to utilize the center of the Dorsey/Kingwood roundabout as a temporary intersection with temporary traffic signals. A short-term detour is proposed using Summers School Road while constructing the connection of the existing Kingwood Pike with the new portion. The existing grade on Kingwood Pike requires stopping on a -6.5% grade at the traffic signal. The grade approaching the roundabout includes a flat grade of less than 2% at the roundabout. In most cases, the roundabout will not require approaching traffic to come to a full or immediate stop, and does not queue traffic on the steep grade as the existing traffic signal does.
740	Both the MMMPO corridor study and the 2018 traffic study determined that traffic flow through the corridor is controlled by the congestion at the major intersections in the corridor. The projected growth in the Morgantown area will continue to increase traffic and congestion at the intersections if improvements do not occur. The MMMPO had completed several previous studies evaluating various transportation plans for the Greenbag Road corridor, with the ultimate vision of transforming Greenbag Road into a safe, efficient, and attractive multimodal transportation facility. The scenarios determined to be evaluated in the traffic study evolved from the outcome of the MMMPO's preliminary studies and findings. Existing two-way stop controlled operations with potential roadway improvements were evaluated as part of the traffic, as well as traffic signal and roundabout options. The intersection of Greenbag Road/Dorsey Avenue/Kingwood Pike is currently controlled by a traffic signal and not by a four-way (all-way) stop, which includes stop sign control on each approach. The intersection would operate at failure (overall intersection LOS F) if existing

	intersection conditions and operations (traffic signal control) were to remain the same 30-years in the future (design year) without any improvements. Therefore, traffic analysis was not completed for a four-way (all-way) stop controlled intersection operations. The turn lane options that were examined do not improve the level of service as much as the roundabout and the turn lanes at Dorsey Avenue/Kingwood Pike involve complete takes of 2 residences and 1 business. These takes are different from what was reported in the EA. This change will be noted in the FONSI. Adding only left turn lanes on Greenbag Road at the Dorsey/Kingwood Pike intersection was evaluated during an initial round of traffic analysis because this option had been suggested by the MPO. The option included upgrading the signal lights to have a protected/permissive left turn phase. The analysis showed that this option would result in some intersection improvements but could not achieve LOS C or better for the overall intersection operation. The overall intersection would operate at an unacceptable LOS (LOS E or F). The eastbound Greenbag Road traffic queue would extend past the Bluegrass Village Driveway. Based on these findings this option was replaced with Options D and E for the EA analysis. The roundabouts were designed to accommodate AASHTO WB-62 truck configuration, which is an interstate semi-truck with a 62' wheel base between steer axle and last trailer axle, including a 48' trailer. Larger trucks can navigate the roundabout and use the internal truck apron. In regards to cost, since the traffic analysis determined that left turn lanes on Greenbag Road did not meet WVDOH's LOS criteria, a cost estimate was not prepared. However, long-term costs associated with roundabouts are significantly less than a traffic signal, since no electrical costs and no traffic signal maintenance are involved with a roundabout. The existing grade on Kingwood Pike requires stopping on a -6.5% grade at the traffic signal. The grade approaching the roundabout includes a flat grade of less than 2% at the roundabout. In most cases, the roundabout will not require approaching traffic to come to a full or immediate stop, and does not queue traffic on the steep grade as the existing traffic signal does. The traffic control plan will continue to be revised during final design, and will not use Aaron's Creek Road as a signed detour. The revised plan intends to utilize the center of the Dorsey/Kingwood roundabout as a temporary intersection with temporary traffic signals. A short-term detour is proposed using Summers School Road while constructing the connection of the existing Kingwood Pike with the new portion. Road repair beyond the scope of this project is being addressed through the Governor's Roads to Prosperity program and progress can be tracked via the WVDOH website.
741	The traffic control plan will continue to be revised during final design, and will not use Aaron's Creek Road as a signed detour. The revised plan intends to utilize the center of the Dorsey/Kingwood roundabout as a temporary intersection with temporary traffic signals. A short-term detour is proposed using Summers School Road while constructing the connection of the existing Kingwood Pike with the new portion.

	The turn lane options that were examined do not improve the level of service as much as the roundabout and the turn lanes at Dorsey Avenue/Kingwood Pike involve complete takes of 2 residences and 1 business. These takes are different from what was reported in the EA. This change will be noted in the FONSI. Adding only left turn lanes on Greenbag Road at the Dorsey/Kingwood Pike intersection was evaluated during an initial round of traffic analysis because this option had been suggested by the MPO. The option included upgrading the signal lights to have a protected/permissive left turn phase. The analysis showed that this option would result in some intersection improvements but could not achieve LOS C or better for the overall intersection operation. The overall intersection would operate at an unacceptable LOS (LOS E or F). The eastbound Greenbag Road traffic queue would extend past the Bluegrass Village Driveway. Based on these findings this option was replaced with Options D and E for the EA analysis. Several studies have been previously completed through the MMMPO, evaluating various transportation plans for the Greenbag Road corridor, with the ultimate vision of transforming Greenbag Road into a safe, efficient, and attractive multimodal transportation facility. The future traffic along Greenbag Road, Mississippi Avenue, Dorsey Avenue, Kingwood Pike were projected for the future design year by assuming existing traffic distribution/patterns but with increased traffic volumes though application of a yearly traffic growth rate of 1.16% per year. It should be noted that the traffic evaluation was completed prior to the COVID-19 pandemic and its effects to traffic currently occurring. The scenarios determined to be evaluated in the traffic study evolved from the outcome of the MMMPO's preliminary studies and findings. Existing two-way stop controlled operations with potential roadway improvements were evaluated as part of the traffic, as well as traffic signal and roundabout options. The intersection of Greenbag Road/Dorsey Avenue/Kingwood Pike is currently controlled by a traffic signal and not by a four-way (all-way) stop, which includes stop sign control on each approach. The intersection would operate at failure (overall intersection LOS F) if existing intersection conditions and operations (traffic signal control) were to remain the same 30-years in the future (design year) without any improvements. Therefore, traffic analysis was not completed for a four-way (all-way) stop controlled intersection operations.
742	The sidewalk design has been extended from the western end of the project area along Greenbag Road to the Dorsey Avenue/Kingwood Pike intersection. At the intersection the sidewalk follows Dorsey Avenue north to Luckey Lane and east on Luckey Lane to the connection with the existing sidewalk at Mountainview Elementary School. The shoulder along the north side of Greenbag Road is being designed to accommodate bicycle use by being wider (3 feet) than the standard shoulder (2 feet). Extensions beyond the scope of this project can be considered during future planning.
743	Conscious Harvest Cooperative Community Garden, Joy and Hemp Universal LLC, and Mockingbird Hill Farms are located on private property and the property owner will be compensated for the sale of any land to the WVDOH during the right-of-way acquisition process. Impacts to this parcel have been minimized to the extent practicable. Approximately 1.56 acres (67,900 square feet) will be required from the parcel.

	Fair market value will be paid for all properties that require full or partial acquisition as a result of the project. When only part of the property is required, as is the case with this parcel, fair market value of the part taken will be paid, plus damages, if any, to the residue, less all benefits. West Virginia law defines "market value" as the price a willing buyer would pay a willing seller, neither acting under compulsion nor duress, both exercising prudence and intelligent judgment as to its value and familiar with the purpose for which the property is reasonably available. Fair market value will be determined by a competent, professional real estate appraiser after a thorough inspection of the property, a comparison with similar properties in the area that have been sold recently, a determination and consideration of its replacement cost and depreciation and consideration of the income-producing potential. All appraisal reports are office-reviewed, then rechecked in the field by experienced, qualified review appraisers for accuracy. Since the Division of Highways has adopted a firm price policy, the property owner will be offered the full amount of the approved appraisal. There will be no attempt to buy property at less than fair market value. This policy guarantees that all citizens of the state receive full value for the money expended for highway rights of way. Those who hold a valid property interest in the property that is acquired for the project will be compensated during the ROW acquisition phase.
744	The turn lane options that were examined do not improve the level of service as much as the roundabout and the turn lanes at Dorsey Avenue/Kingwood Pike involve complete takes of 2 residences and 1 business. These takes are different from what was reported in the EA. This change will be noted in the FONSI. Adding only left turn lanes on Greenbag Road at the Dorsey/Kingwood Pike intersection was evaluated during an initial round of traffic analysis because this option had been suggested by the MPO. The option included upgrading the signal lights to have a protected/permissive left turn phase. The analysis showed that this option would result in some intersection improvements but could not achieve LOS C or better for the overall intersection operation. The overall intersection would operate at an unacceptable LOS (LOS E or F). The eastbound Greenbag Road traffic queue would extend past the Bluegrass Village Driveway. Based on these findings this option was replaced with Options D and E for the EA analysis. The traffic control plan will continue to be revised during final design, and will not use Aaron's Creek Road as a signed detour. The revised plan intends to utilize the center of the Dorsey/Kingwood roundabout as a temporary intersection with temporary traffic signals. A short-term detour is proposed using Summers School Road while constructing the connection of the existing Kingwood Pike with the new portion.
745	The EA analysis included evaluation of potential impacts to numerous categories including natural resources, cultural resources, land use, indirect, and cumulative effects. The cultural resources surveys were conducted according to the guidelines published by the WV State Historic Preservation Office. The archaeological survey included the excavation of 213 shovel test pits, one test excavation unit, and visual inspection of the entire surface area within the defined area of potential effect. Based on the SHPO guidelines, when no cultural resources are identified during the Phase I survey, an abbreviated technical report is acceptable. As the reviewing agency, the WV SHPO concurred with the recommendation that no further archaeological investigations were warranted and no archaeological historic properties are present in the study area. The historic structures survey resulted in the identification of 25 structures 45+ years old within the defined area of potential effect. Two of

	the resources were recommended eligible for the National Register of Historic Places and the project was designed to avoid potential impacts to these properties. As the reviewing agency, the WV SHPO concurred with the recommendation that the project would not adversely affect any NRHP eligible resources and that no further historic structures investigations were needed. The cultural resources reports are available as an Appendix to the EA on the WVDOH website at https://transportation.wv.gov/highways/engineering/comment/closed/greenbagroadimprovementproject/Pages/default.aspx. The EA reported impacts to Federal Farmland Protection Policy Act (FPPA) soils. The entire Greenbag Road environmental study area is encompassed by "land already in or committed to urban development" as defined by the FPPA (see 7 CFR § 658.2 - Definitions) and is therefore not subject to provisions of FPPA. Please refer to the Farmland Appendix attached to the FONSI for further detail. Fair market value will be paid for all properties that require full or partial acquisition as a result of the project. When only part of the property is required, as is the case with this parcel, fair market value of the part taken will be paid, plus damages, if any, to the residue, less all benefits. West Virginia law defines "market value" as the price a willing buyer would pay a willing seller, neither acting under compulsion nor duress, both exercising prudence and intelligent judgment as to its value and familiar with the purpose for which the property is reasonably available. Fair market value will be determined by a competent, professional real estate appraiser after a thorough inspection of the property, a comparison with similar properties in the area that have been sold recently, a determination and consideration of its replacement cost and depreciation and consideration of the income-producing potential. All appraisal reports are office-reviewed, then rechecked in the field by experienced, qualified review appraisers for accuracy. Since the Division of Highways has adopted a firm price policy, the property owner will be offered the full amount of the approved appraisal. There will be no attempt to buy property at less than fair market value. This policy guarantees that all citizens of the state receive full value for the money expended for highway rights of way.
746	The turn lane options that were examined do not improve the level of service as much as the roundabout and the turn lanes at Dorsey Avenue/Kingwood Pike involve complete takes of 2 residences and 1 business. These takes are different from what was reported in the EA. This change will be noted in the FONSI. Adding only left turn lanes on Greenbag Road at the Dorsey/Kingwood Pike intersection was evaluated during an initial round of traffic analysis because this option had been suggested by the MPO. The option included upgrading the signal lights to have a protected/permissive left turn phase. The analysis showed that this option would result in some intersection improvements but could not achieve LOS C or better for the overall intersection operation. The overall intersection would operate at an unacceptable LOS (LOS E or F). The eastbound Greenbag Road traffic queue would extend past the Bluegrass Village Driveway. Based on these findings this option was replaced with Options D and E for the EA analysis. Road repair beyond the scope of this project is being addressed through the Governor's Roads to Prosperity program and progress can be tracked via the WVDOH website.

	The EA reviewed multiple alternatives including turn lanes, traffic lights, and the roundabouts. Through the analysis in the EA, the only alternative that meets the purpose and need of the project is the roundabout. Roundabouts are designed to maintain a constant flow of traffic through the intersection which results in reduced congestion on roadways and a reduction in delays for drivers. Studies have shown that changing signalized intersections to roundabouts can have up to an 89% average reduction in vehicle delays. The improved traffic flow also results in reduced vehicle emissions including carbon monoxide, nitrous oxide, and carbon dioxide at the intersection. Additionally, roundabouts are designed to slow speeds in the approach and through the roundabout allowing drivers more response time and limiting the number of potential directions where traffic could approach.
747	The turn lane options that were examined do not improve the level of service as much as the roundabout and the turn lanes at Dorsey Avenue/Kingwood Pike involve complete takes of 2 residences and 1 business. These takes are different from what was reported in the EA. This change will be noted in the FONSI. Adding only left turn lanes on Greenbag Road at the Dorsey/Kingwood Pike intersection was evaluated during an initial round of traffic analysis because this option had been suggested by the MPO. The option included upgrading the signal lights to have a protected/permissive left turn phase. The analysis showed that this option would result in some intersection improvements but could not achieve LOS C or better for the overall intersection operation. The overall intersection would operate at an unacceptable LOS (LOS E or F). The eastbound Greenbag Road traffic queue would extend past the Bluegrass Village Driveway. All appraisal reports are office-reviewed, then rechecked in the field by experienced, qualified

	review appraisers for accuracy. Since the Division of Highways has adopted a firm price policy, the property owner will be offered the full amount of the approved appraisal. There will be no attempt to buy property at less than fair market value. This policy guarantees that all citizens of the state receive full value for the money expended for highway rights of way Those who hold a valid property interest in the property that is acquired for the project will be compensated during the ROW acquisition phase. The preliminary investigation and engineering traffic study has examined two build alternatives and three options for each of the major intersections. The intersection options that were evaluated and analyzed include turning lanes, traffic signals, and roundabouts. WVDOH requires intersection improvements to meet or exceed an overall intersection LOS C or better during the peak hours studied for design year improvements. The times of day (peak hours) selected to be studied followed WVDOH guidelines and is standard traffic engineering practice for determining future intersection improvements. At the intersection of Greenbag Road/Dorsey Avenue/Kingwood Pike the traffic analysis determined that the intersection would operate at failure (overall intersection LOS F) if existing intersection conditions and operations were to remain the same 30-years in the future (design year) without any improvements. Adding only left turn lanes on Greenbag Road at the Dorsey/Kingwood Pike intersection was evaluated during an initial round of traffic analysis because this option had been suggested by the MPO. The option included upgrading the signal lights to have a protected/permissive left turn phase. The analysis showed that this option would result in some intersection improvements but could not achieve LOS C or better for the overall intersection operation. The overall intersection would operate at an unacceptable LOS (LOS E). In addition, the left turn lane option would result in the eastbound Greenbag Road traffic queue to extend past the Bluegrass Village Driveway. The traffic analysis determined that with installation of a roundabout the overall intersection would operate at a LOS C, meeting WVDOH design year criteria. At the intersection of Greenbag Road/Mississippi Avenue the traffic analysis determined that the intersection would operate at failure (overall intersection LOS F) if existing intersection conditions and operations were to remain the same 30-years in the future (design year) without any improvements. The design year with improvements scenarios evaluated determined that with installation of a roundabout the overall intersection would operate at a LOS A, best operating conditions, for all peak hours studied. Installation of a traffic signal with turn lanes resulted in an overall intersection LOS B during the AM peak hour, with the Mississippi Avenue approach operating at a LOS C. Though the analysis meets WVDOH minimum LOS criteria, the roundabout option exceeds WVDOH minimum LOS criteria. Roundabouts help reduce vehicular delay and promotes a continuous flow of traffic, which increases traffic capacity at an intersection. The roundabouts have been designed with larger vehicles in mind and incorporate truck aprons to support the weight and turning radius of larger vehicles, including school buses. In addition, roundabouts help reduce the likelihood and severity of collisions. Studies by the Federal

	Highway Administration (FHWA) have shown that roundabouts typically achieve reduction in overall collisions, injury collisions, fatality collisions, and pedestrian collisions. Reasons for these reductions due to the installation of a roundabout include: - Low travel speeds – Drivers must slow down and yield to traffic before entering a roundabout. The reduction in speeds results in a decrease in crash severity and injury. - No traffic light "to beat" – The design of a roundabout promotes a continuous circular flow of traffic. Because of this design, drivers will not have the incentive to speed up to "beat the light", like they may at a traditional intersection. - One way travel – The design of a roundabout directs drivers through gently designed curves into a one-way counterclockwise circular path. This design eliminates the possibilities for T-bone and head-on collisions. In addition, a conventional 4-way intersection has 32 points of vehicle conflict due to the different crossings and maneuvers through the intersection. A roundabout has 8 points of conflict, which all occur in the same direction, reducing crash severity and likelihood of injury. Lastly, long-term costs associated with roundabouts are significantly less than a traffic signal, since no electrical costs and no traffic signal maintenance costs are involved with a roundabout. The sidewalk design has been extended from the western end of the project area along Greenbag Road to the Dorsey Avenue/Kingwood Pike intersection. At the intersection the sidewalk follows Dorsey Avenue north to Luckey Lane and east on Luckey Lane to the connection with the existing sidewalk at Mountainview Elementary School. The shoulder along the north side of Greenbag Road is being designed to accommodate bicycle use by being wider (3 feet) than the standard shoulder (2 feet). Pedestrians should use the dedicated crosswalks when safely crossing, just like crossing any other intersection. At a roundabout, pedestrian crosswalks will be placed to cross each roadway leg to the roundabout, which is the same as traditional intersection crossings. The roundabout pedestrian crosswalk placement allows pedestrians to cross one direction of traffic a time at each roundabout approach because of the splitter island. Pedestrians should also use the designated crosswalk locations. The use of crossing guards is outside the scope of the WVDOH.
750	Conscious Harvest Cooperative Community Garden, Joy and Hemp Universal LLC, and Mockingbird Hill Farms are located on private property and the property owner will be compensated for the sale of any land to the WVDOH during the right-of-way acquisition process. Impacts to this parcel have been minimized to the extent practicable. Approximately 1.56 acres (67,900 square feet) will be required from the parcel.

	Fair market value will be paid for all properties that require full or partial acquisition as a result of the project. When only part of the property is required, as is the case with this parcel, fair market value of the part taken will be paid, plus damages, if any, to the residue, less all benefits. West Virginia law defines "market value" as the price a willing buyer would pay a willing seller, neither acting under compulsion nor duress, both exercising prudence and intelligent judgment as to its value and familiar with the purpose for which the property is reasonably available. Fair market value will be determined by a competent, professional real estate appraiser after a thorough inspection of the property, a comparison with similar properties in the area that have been sold recently, a determination and consideration of its replacement cost and depreciation and consideration of the income-producing potential. All appraisal reports are office-reviewed, then rechecked in the field by experienced, qualified review appraisers for accuracy. Since the Division of Highways has adopted a firm price policy, the property owner will be offered the full amount of the approved appraisal. There will be no attempt to buy property at less than fair market value. This policy guarantees that all citizens of the state receive full value for the money expended for highway rights of way. Those who hold a valid property interest in the property that is acquired for the project will be compensated during the ROW acquisition phase. The EA reported impacts to Federal Farmland Protection Policy Act (FPPA) soils. The entire Greenbag Road environmental study area is encompassed by "land already in or committed to urban development" as defined by the FPPA (see 7 CFR § 658.2 - Definitions) and is therefore not subject to provisions of FPPA. Please refer to the Farmland Appendix attached to the FONSI for further detail. Both the MMMPO corridor study and the 2018 traffic study determined that traffic flow through the corridor is controlled by the congestion at the major intersections in the corridor. The projected growth in the Morgantown area will continue to increase traffic and congestion at the intersections if improvements do not occur. The MMMPO had completed several previous studies evaluating various transportation plans for the Greenbag Road corridor, with the ultimate vision of transforming Greenbag Road into a safe, efficient, and attractive multimodal transportation facility. The preliminary investigation and engineering traffic study has examined two build alternatives and three options for each of the major intersections. The intersection options that were evaluated and analyzed include turning lanes, traffic signals, and roundabouts. WVDOH requires intersection improvements to meet or exceed an overall intersection LOS C or better during the peak hours studied for design year improvements. The times of day (peak hours) selected to be studied followed WVDOH guidelines and is standard traffic engineering practice for determining future intersection improvements. At the intersection of Greenbag Road/Dorsey Avenue/Kingwood Pike the traffic analysis determined that the intersection would operate at failure (overall intersection LOS F) if existing intersection conditions and operations were to remain the same 30-years in the future (design year) without any improvements. Adding only left turn lanes on Greenbag Road at the Dorsey/Kingwood Pike intersection was evaluated during an initial round of traffic analysis because this option had been suggested by the MPO. The option included upgrading the signal lights to have

	a protected/permissive left turn phase. The analysis showed that this option would result in some intersection improvements but could not achieve LOS C or better for the overall intersection operation. The overall intersection would operate at an unacceptable LOS (LOS E). In addition, the left turn lane option would result in the eastbound Greenbag Road traffic queue to extend past the Bluegrass Village Driveway. The traffic analysis determined that with installation of a roundabout the overall intersection would operate at a LOS C, meeting WVDOH design year criteria. In regards to cost, since the traffic analysis determined that left turn lanes on Greenbag Road did not meet WVDOH's LOS criteria, a cost estimate was not prepared. However, long-term costs associated with roundabouts are significantly less than a traffic signal, since no electrical costs and no traffic signal maintenance are involved with a roundabout
751	The preliminary investigation and engineering traffic study has examined two build alternatives and three options for each of the major intersections. The intersection options that were evaluated and analyzed include turning lanes, traffic signals, and roundabouts. WVDOH requires intersection improvements to meet or exceed an overall intersection LOS C or better during the peak hours studied for design year improvements. The times of day (peak hours) selected to be studied followed WVDOH guidelines and is standard traffic engineering practice for determining future intersection improvements. Roundabouts are designed to maintain a constant flow of traffic through the intersection which results in reduced congestion on roadways and a reduction in delays for drivers. Studies have shown that changing signalized intersections to roundabouts can have up to an 89% average reduction in vehicle delays. The improved traffic flow also results in reduced vehicle emissions including carbon monoxide, nitrous oxide, and carbon dioxide at the intersection. Additionally, roundabouts are designed to slow speeds in the approach and through the roundabout allowing drivers more response time and limiting the number of potential directions where traffic could approach. The diversion of traffic from downtown, including large trucks, is not within the scope of this project. At the intersection of Greenbag Road/Dorsey Avenue/Kingwood Pike the traffic analysis determined that the intersection would operate at failure (overall intersection LOS F) if existing intersection conditions and operations were to remain the same 30-years in the future (design year) without any improvements. Adding only left turn lanes on Greenbag Road at the Dorsey/Kingwood Pike intersection was evaluated during an initial round of traffic analysis because this option had been suggested by the MPO. The option included upgrading the signal lights to have a protected/permissive left turn phase. The analysis showed that this option would result in some intersection improvements but could not achieve LOS C or better for the overall intersection operation. The overall intersection would operate at an unacceptable LOS (LOS E). In addition, the left turn lane option would result in the eastbound Greenbag Road traffic queue to extend past the Bluegrass Village Driveway.

	The traffic analysis determined that with installation of a roundabout the overall intersection would operate at a LOS C, meeting WVDOH design year criteria. The roundabouts have been designed with larger vehicles in mind and incorporate truck aprons to support the weight and turning radius of larger vehicles, including school buses. In addition, roundabouts help reduce the likelihood and severity of collisions. Studies by the Federal Highway Administration (FHWA) have shown that roundabouts typically achieve reduction in overall collisions, injury collisions, fatality collisions, and pedestrian collisions. Reasons for these reductions due to the installation of a roundabout include: - Low travel speeds – Drivers must slow down and yield to traffic before entering a roundabout. The reduction in speeds results in a decrease in crash severity and injury. - No traffic light "to beat" – The design of a roundabout promotes a continuous circular flow of traffic. Because of this design, drivers will not have the incentive to speed up to "beat the light", like they may at a traditional intersection. - One way travel – The design of a roundabout directs drivers through gently designed curves into a one-way counterclockwise circular path. This design eliminates the possibilities for T-bone and head-on collisions. In addition, a conventional 4-way intersection has 32 points of vehicle conflict due to the different crossings and maneuvers through the intersection. A roundabout has 8 points of conflict, which all occur in the same direction, reducing crash severity and likelihood of injury. Lastly, long-term costs associated with roundabouts are significantly less than a traffic signal, since no electrical costs and no traffic signal maintenance costs are involved with a roundabout. The roundabout at the intersection of Greenbag Road/Dorsey Avenue/Kingwood Pike (Option F) has a lower construction cost than either of the turn lane options (Options D and E).
752	The WVDOH will examine all safety concerns including crossings of Greenbag Road as part of the final design. The need for a sidewalk was identified by the public in the comments for the MMMPO corridor study as one of the factors to improve safety in the Greenbag Road corridor. Pedestrians should use the dedicated crosswalks when safely crossing, just like crossing any other intersection. At a roundabout, pedestrian crosswalks will be placed to cross each roadway leg to the roundabout, which is the same as traditional intersection crossings. The roundabout pedestrian crosswalk placement allows pedestrians to cross one direction of traffic a time at each roundabout approach because of the splitter island. Pedestrians should also use the designated crosswalk locations. Crossing to the center of the roundabout is not recommended.

753	The roundabouts were designed to accommodate AASHTO WB-62 truck configuration, which is an interstate semi-truck with a 62' wheel base between steer axle and last trailer axle, including a 48' trailer. Larger trucks can navigate the roundabout and use the internal truck apron. The traffic control plan will continue to be revised during final design, and will not use Aaron's Creek Road as a signed detour. The revised plan intends to utilize the center of the Dorsey/Kingwood roundabout as a temporary intersection with temporary traffic signals. A short-term detour is proposed using Summers School Road while constructing the connection of the existing Kingwood Pike with the new portion. Both the MMMPO corridor study and the 2018 traffic study determined that traffic flow through the corridor is controlled by the congestion at the major intersections in the corridor. The projected growth in the Morgantown area will continue to increase traffic and congestion at the intersections if improvements do not occur. The MMMPO had completed several previous studies evaluating various transportation plans for the Greenbag Road corridor, with the ultimate vision of transforming Greenbag Road into a safe, efficient, and attractive multimodal transportation facility. Conscious Harvest Cooperative Community Garden, Joy and Hemp Universal LLC, and Mockingbird Hill Farms are located on private property and the property owner will be compensated for the sale of any land to the WVDOH during the right-of-way acquisition process. Impacts to this parcel have been minimized to the extent practicable. Approximately 1.56 acres (67,900 square feet) will be required from the parcel. Fair market value will be paid for all properties that require full or partial acquisition as a result of the project. When only part of the property is required, as is the case with this parcel, fair market value of the part taken will be paid, plus damages, if any, to the residue, less all benefits. West Virginia law defines "market value" as the price a willing buyer would pay a willing seller, neither acting under compulsion nor duress, both exercising prudence and intelligent judgment as to its value and familiar with the purpose for which the property is reasonably available. Fair market value will be determined by a competent, professional real estate appraiser after a thorough inspection of the property, a comparison with similar properties in the area that have been sold recently, a determination and consideration of its replacement cost and depreciation and consideration of the income-producing potential. All appraisal reports are office-reviewed, then rechecked in the field by experienced, qualified review appraisers for accuracy. Since the Division of Highways has adopted a firm price policy, the property owner will be offered the full amount of the approved appraisal. There will be no attempt to buy property at less than fair market value. This policy guarantees that all citizens of the state receive full value for the money expended for highway rights of way. Those who hold a valid property interest in the property that is acquired for the project will be compensated during the ROW acquisition phase. The EA reported impacts to Federal Farmland Protection Policy Act (FPPA) soils. The entire Greenbag Road environmental study area is encompassed by "land already in or committed to urban development" as defined by the FPPA (see 7 CFR § 658.2 - Definitions) and is therefore not subject to provisions of FPPA. Please refer to the Farmland Appendix attached to the FONSI for further detail.

	The traffic control plan, which will outline the intended traffic detour tour, will continue to be revised during final design. It should be noted that Aaron's Creek Road will not be utilized as a signed detour. The anticipated plan intends to utilize the center of the Dorsey Avenue /Kingwood Pike roundabout as a temporary intersection with temporary traffic signals during construction. A short-term detour is proposed using Summers School Road while constructing the connection of the existing Kingwood Pike with the new portion.
754	Conscious Harvest Cooperative Community Garden, Joy and Hemp Universal LLC, and Mockingbird Hill Farms are located on private property and the property owner will be compensated for the sale of any land to the WVDOH during the right-of-way acquisition process. Impacts to this parcel have been minimized to the extent practicable. Approximately 1.56 acres (67,900 square feet) will be required from the parcel. Fair market value will be paid for all properties that require full or partial acquisition as a result of the project. When only part of the property is required, as is the case with this parcel, fair market value of the part taken will be paid, plus damages, if any, to the residue, less all benefits. West Virginia law defines "market value" as the price a willing buyer would pay a willing seller, neither acting under compulsion nor duress, both exercising prudence and intelligent judgment as to its value and familiar with the purpose for which the property is reasonably available. Fair market value will be determined by a competent, professional real estate appraiser after a thorough inspection of the property, a comparison with similar properties in the area that have been sold recently, a determination and consideration of its replacement cost and depreciation and consideration of the income-producing potential. All appraisal reports are office-reviewed, then rechecked in the field by experienced, qualified review appraisers for accuracy. Since the Division of Highways has adopted a firm price policy, the property owner will be offered the full amount of the approved appraisal. There will be no attempt to buy property at less than fair market value. This policy guarantees that all citizens of the state receive full value for the money expended for highway rights of way. Those who hold a valid property interest in the property that is acquired for the project will be compensated during the ROW acquisition phase. The EA reported impacts to Federal Farmland Protection Policy Act (FPPA) soils. The entire Greenbag Road environmental study area is encompassed by "land already in or committed to urban development" as defined by the FPPA (see 7 CFR § 658.2 - Definitions) and is therefore not subject to provisions of FPPA. Please refer to the Farmland Appendix attached to the FONSI for further detail. The roundabouts were designed to accommodate AASHTO WB-62 truck configuration, which is an interstate semi-truck with a 62' wheel base between steer axle and last trailer axle, including a 48' trailer. Larger trucks can navigate the roundabout and use the internal truck apron. The turn lane options that were examined do not improve the level of service as much as the roundabout and the turn lanes at Dorsey Avenue/Kingwood Pike involve complete takes of 2 residences and 1 business. These takes are different from what was reported in the EA. This change will be noted in the FONSI. Adding only left turn lanes on Greenbag Road at the Dorsey/Kingwood Pike intersection was evaluated during an initial round of traffic analysis because this option had been suggested by the MPO. The option included upgrading the signal lights to

	have a protected/permissive left turn phase. The analysis showed that this option would result in some intersection improvements but could not achieve LOS C or better for the overall intersection operation. The overall intersection would operate at an unacceptable LOS (LOS E or F). The eastbound Greenbag Road traffic queue would extend past the Bluegrass Village Driveway. Based on these findings this option was replaced with Options D and E for the EA analysis.
755	The WVDOH will examine all safety concerns including crossings of Greenbag Road as part of the final design. Pedestrians should use the dedicated crosswalks when safely crossing, just like crossing any other intersection. At a roundabout, pedestrian crosswalks will be placed to cross each roadway leg to the roundabout, which is the same as traditional intersection crossings. The roundabout pedestrian crosswalk placement allows pedestrians to cross one direction of traffic a time at each roundabout approach because of the splitter island. Pedestrians should also use the designated crosswalk locations.
756	We appreciate your input regarding the project.
757	The sidewalk design has been extended from the western end of the project area along Greenbag Road to the Dorsey Avenue/Kingwood Pike intersection. At the intersection the sidewalk follows Dorsey Avenue north to Luckey Lane and east on Luckey Lane to the connection with the existing sidewalk at Mountainview Elementary School. The shoulder along the north side of Greenbag Road is being designed to accommodate bicycle use by being wider (3 feet) than the standard shoulder (2 feet). Extensions beyond the scope of this project can be considered during future planning. Roundabouts help reduce the likelihood and severity of collisions. Studies by the Federal Highway Administration (FHWA) have shown that roundabouts typically achieve reduction in overall collisions, injury collisions, fatality collisions, and pedestrian collisions. Reasons for these reductions due to the installation of a roundabout include: Low travel speeds – Drivers must slow down and yield to traffic before entering a roundabout. The reduction in speeds results in a decrease in crash severity and injury. No traffic light “to beat” – The design of a roundabout promotes a continuous circular flow of traffic. Because of this design, drivers will not have the incentive to speed up to “beat the light”, like they may at a traditional intersection. One way travel – The design of a roundabout directs drivers through gently designed curves into a one-way counterclockwise circular path. This design eliminates the possibilities for T-bone and head-on collisions.

	In addition, a conventional 4-way intersection has 32 points of vehicle conflict due to the different maneuvers through the intersection. A roundabout has 8 points of conflict, which all occur in the same direction, reducing crash severity and likelihood of injury.
758	A shared-use path was part of some early versions of the project, but the right of way impacts along Bluegrass Village and the Kennedy Center were significant. Due to these detrimental impacts the shared use path was removed from the alternatives that were advanced to the EA. The sidewalk design has been extended from the western end of the project area along Greenbag Road to the Dorsey Avenue/Kingwood Pike intersection. At the intersection the sidewalk follows Dorsey Avenue north to Luckey Lane and east on Luckey Lane to the connection with the existing sidewalk at Mountainview Elementary School. The shoulder along the north side of Greenbag Road is being designed to accommodate bicycle use by being wider (3 feet) than the standard shoulder (2 feet). Extensions beyond the scope of this project can be considered during future planning. Roundabouts help reduce the likelihood and severity of collisions. This design eliminates the possibilities for T-bone and head-on collisions. In addition, a conventional 4-way intersection has 32 points of vehicle conflict due to the different maneuvers through the intersection. A roundabout has 8 points of conflict, which all occur in the same direction, reducing crash severity and likelihood of injury.

762	The EA reviewed multiple alternatives including turn lanes, traffic lights, and the roundabouts. Through the analysis in the EA, the only alternative that meets the purpose and need of the project is the roundabout. Both the MMMPO corridor study and the 2018 traffic study determined that traffic flow through the corridor is controlled by the congestion at the major intersections in the corridor. The projected growth in the Morgantown area will continue to increase traffic and congestion at the intersections if improvements do not occur. Drainage issues within the project footprint will be addressed by the project design. The existing grade on Kingwood Pike requires stopping on a -6.5% grade at the traffic signal. The grade approaching the roundabout includes a flat grade of less than 2% at the roundabout. In most cases, the roundabout will not require approaching traffic to come to a full or immediate stop, and does not queue traffic on the steep grade as the existing traffic signal does. The traffic control plan will continue to be revised during final design, and will not use Aaron's Creek Road as a signed detour. The revised plan intends to utilize the center of the Dorsey/Kingwood roundabout as a temporary intersection with temporary traffic signals. A short-term detour is proposed using Summers School Road while constructing the connection of the existing Kingwood Pike with the new portion. The diversion of traffic from downtown, including large trucks, is not within the scope of this project. The roundabouts were designed to accommodate AASHTO WB-62 truck configuration, which is an interstate semi-truck with a 62' wheel base between steer axle and last trailer axle, including a 48' trailer. Larger trucks can navigate the roundabout and use the internal truck apron. The turn lane options that were examined do not improve the level of service as much as the roundabout and the turn lanes at Dorsey Avenue/Kingwood Pike involve complete takes of 2 residences and 1 business. These takes are different from what was reported in the EA. This change will be noted in the FONSI. Adding only left turn lanes on Greenbag Road at the Dorsey/Kingwood Pike intersection was evaluated during an initial round of traffic analysis because this option had been suggested by the MPO. The option included upgrading the signal lights to have a protected/permissive left turn phase. The analysis showed that this option would result in some intersection improvements but could not achieve LOS C or better for the overall intersection operation. The overall intersection would operate at an unacceptable LOS (LOS E or F). The eastbound Greenbag Road traffic queue would extend past the Bluegrass Village Driveway. Based on these findings this option was replaced with Options D and E for the EA analysis.
763	We appreciate your input regarding the project.
764	The sidewalk design has been extended from the western end of the project area along Greenbag Road to the Dorsey Avenue/Kingwood Pike intersection. At the intersection the sidewalk follows Dorsey Avenue north to Luckey Lane and east on Luckey Lane to the connection with the

	existing sidewalk at Mountainview Elementary School. The shoulder along the north side of Greenbag Road is being designed to accommodate bicycle use by being wider (3 feet) than the standard shoulder (2 feet). Extensions beyond the scope of this project can be considered during future planning. Roundabouts help reduce the likelihood and severity of collisions. Studies by the Federal Highway Administration (FHWA) have shown that roundabouts typically achieve reduction in overall collisions, injury collisions, fatality collisions, and pedestrian collisions. Reasons for these reductions due to the installation of a roundabout include: Low travel speeds – Drivers must slow down and yield to traffic before entering a roundabout. The reduction in speeds results in a decrease in crash severity and injury. No traffic light "to beat" – The design of a roundabout promotes a continuous circular flow of traffic. Because of this design, drivers will not have the incentive to speed up to "beat the light", like they may at a traditional intersection. One way travel – The design of a roundabout directs drivers through gently designed curves into a one-way counterclockwise circular path. This design eliminates the possibilities for T-bone and head-on collisions. In addition, a conventional 4-way intersection has 32 points of vehicle conflict due to the different maneuvers through the intersection. A roundabout has 8 points of conflict, which all occur in the same direction, reducing crash severity and likelihood of injury.
765	As stated in the WVDOH Design Directive 506, the WVDOH adheres to the regulations of the WV Department of Environmental Protection and the Clean Water Act Section 402. The WVDOH does not have legal authority to regulate post construction storm water management beyond state right-of-way. During final design, further avoidance and/or minimization measures will be considered and/or implemented as appropriate to reduce the total impacts to streams. Specific Best Management Practices will be developed prior to construction to reduce the amount of disturbed aquatic habitat and riparian vegetation; minimize opportunities for increased sedimentation during construction; revegetate all disturbed areas to prevent accelerated erosion; designate equipment fueling and service areas away from aquatic habitats; and designate and construct all stormwater management facilities to prevent runoff. Coordination with resource agencies will continue throughout construction activities as necessary. The stormwater management plan for this project will meet the volume and rate requirements of the Morgantown Utility Board and WVDOH policies. Due to the existing topography and features it is likely that these requirements will require basins and other stormwater BMP's, such as vegetated swales. The amount of offsite runoff to the streams and wetlands will be minimized where practicable in order to limit basin size and

	meet the design criteria. Stormwater design for the project will be completed during final design and will minimize the impacts to the streams and wetlands located within and adjacent to the project right of way. Improvements beyond the scope of this project can be considered during future planning.
766	The proposed roundabouts on Greenbag are more straightforward and more traditional roundabout designs, without all of the confusing lanes that are sometimes present. The roundabouts on Greenbag Road will be more intuitive for drivers. The WVDOH has examined two build alternatives and three options for each of the major intersections. The intersection options that were evaluated and analyzed include turning lanes, traffic signals, and roundabouts. The evaluation and analysis of these intersection options indicate that the roundabout would provide the most improvement to traffic congestion, has the lowest estimated construction cost, and does not displace any residences. Estimated construction costs have been reviewed for each of the alternatives and options. The roundabout option at Dorsey Avenue (F) represents the least expensive of the estimates.
767	The preliminary investigation and engineering traffic study has examined two build alternatives and three options for each of the major intersections. The intersection options that were evaluated and analyzed include turning lanes, traffic signals, and roundabouts. WVDOH requires intersection improvements to meet or exceed an overall intersection LOS C or better during the peak hours studied for design year improvements. The times of day (peak hours) selected to be studied followed WVDOH guidelines and is standard traffic engineering practice for determining future intersection improvements. At the intersection of Greenbag Road/Dorsey Avenue/Kingwood Pike the traffic analysis determined that the intersection would operate at failure (overall intersection LOS F) if existing intersection conditions and operations were to remain the same 30-years in the future (design year) without any improvements. Adding only left turn lanes on Greenbag Road at the Dorsey/Kingwood Pike intersection was evaluated during an initial round of traffic analysis because this option had been suggested by the MPO. The option included upgrading the signal lights to have a protected/permissive left turn phase. The analysis showed that this option would result in some intersection improvements but could not achieve LOS C or better for the overall intersection operation. The overall intersection would operate at an unacceptable LOS (LOS E). In addition, the left turn lane option would result in the eastbound Greenbag Road traffic queue to extend past the Bluegrass Village Driveway. The traffic analysis determined that with installation of a roundabout the overall intersection would operate at a LOS C, meeting WVDOH design year criteria. At the intersection of Greenbag Road/Mississippi Avenue the traffic analysis determined that the intersection would operate at failure (overall intersection LOS F) if existing intersection conditions and operations were to remain the same 30-years in the future (design year) without any improvements. The design year with improvements scenarios evaluated determined that with installation of a roundabout the overall

	intersection would operate at a LOS A, best operating conditions, for all peak hours studied. Installation of a traffic signal with turn lanes resulted in an overall intersection LOS B during the AM peak hour, with the Mississippi Avenue approach operating at a LOS C. Though the analysis meets WVDOH minimum LOS criteria, the roundabout option exceeds WVDOH minimum LOS criteria. Roundabouts help reduce vehicular delay and promotes a continuous flow of traffic, which increases traffic capacity at an intersection. The traffic control plan will continue to be revised during final design, and will not use Aaron's Creek Road as a signed detour. The revised plan intends to utilize the center of the Dorsey/Kingwood roundabout as a temporary intersection with temporary traffic signals. A short-term detour is proposed using Summers School Road while constructing the connection of the existing Kingwood Pike with the new portion.
768	The preliminary investigation and engineering traffic study has examined two build alternatives and three options for each of the major intersections. The intersection options that were evaluated and analyzed include turning lanes, traffic signals, and roundabouts. WVDOH requires intersection improvements to meet or exceed an overall intersection LOS C or better during the peak hours studied for design year improvements. The times of day (peak hours) selected to be studied followed WVDOH guidelines and is standard traffic engineering practice for determining future intersection improvements. At the intersection of Greenbag Road/Dorsey Avenue/Kingwood Pike the traffic analysis determined that the intersection would operate at failure (overall intersection LOS F) if existing intersection conditions and operations were to remain the same 30-years in the future (design year) without any improvements. Adding only left turn lanes on Greenbag Road at the Dorsey/Kingwood Pike intersection was evaluated during an initial round of traffic analysis because this option had been suggested by the MPO. The option included upgrading the signal lights to have a protected/permissive left turn phase. The analysis showed that this option would result in some intersection improvements but could not achieve LOS C or better for the overall intersection operation. The overall intersection would operate at an unacceptable LOS (LOS E). In addition, the left turn lane option would result in the eastbound Greenbag Road traffic queue to extend past the Bluegrass Village Driveway. The traffic analysis determined that with installation of a roundabout the overall intersection would operate at a LOS C, meeting WVDOH design year criteria. At the intersection of Greenbag Road/Mississippi Avenue the traffic analysis determined that the intersection would operate at failure (overall intersection LOS F) if existing intersection conditions and operations were to remain the same 30-years in the future (design year) without any improvements. The design year with improvements scenarios evaluated determined that with installation of a roundabout the overall intersection would operate at a LOS A, best operating conditions, for all peak hours studied. Installation of a traffic signal with turn lanes resulted in an overall intersection LOS B during the AM peak hour, with the Mississippi Avenue approach operating at a LOS C. Though the analysis meets WVDOH minimum LOS criteria, the roundabout option exceeds WVDOH minimum LOS criteria. Roundabouts help reduce vehicular delay and promotes a continuous flow of traffic, which increases traffic capacity at an intersection.

	The roundabouts were designed to accommodate AASHTO WB-62 truck configuration, which is an interstate semi-truck with a 62' wheel base between steer axle and last trailer axle, including a 48' trailer. Larger trucks can navigate the roundabout and use the internal truck apron. The traffic control plan will continue to be revised during final design, and will not use Aaron's Creek Road as a signed detour. The revised plan intends to utilize the center of the Dorsey/Kingwood roundabout as a temporary intersection with temporary traffic signals. A short-term detour is proposed using Summers School Road while constructing the connection of the existing Kingwood Pike with the new portion. In regards to cost, long-term costs associated with roundabouts are significantly less than a traffic signal, since no electrical costs and no traffic signal maintenance are involved with a roundabout.
769	The sidewalk design has been extended from the western end of the project area along Greenbag Road to the Dorsey Avenue/Kingwood Pike intersection. At the intersection the sidewalk follows Dorsey Avenue north to Luckey Lane and east on Luckey Lane to the connection with the existing sidewalk at Mountainview Elementary School. The shoulder along the north side of Greenbag Road is being designed to accommodate bicycle use by being wider (3 feet) than the standard shoulder (2 feet). Extensions beyond the scope of this project can be considered during future planning. Roundabouts help reduce the likelihood and severity of collisions. Studies by the Federal Highway Administration (FHWA) have shown that roundabouts typically achieve reduction in overall collisions, injury collisions, fatality collisions, and pedestrian collisions. Reasons for these reductions due to the installation of a roundabout include: Low travel speeds – Drivers must slow down and yield to traffic before entering a roundabout. The reduction in speeds results in a decrease in crash severity and injury. No traffic light "to beat" – The design of a roundabout promotes a continuous circular flow of traffic. Because of this design, drivers will not have the incentive to speed up to "beat the light", like they may at a traditional intersection. One way travel – The design of a roundabout directs drivers through gently designed curves into a one-way counterclockwise circular path. This design eliminates the possibilities for T-bone and head-on collisions. In addition, a conventional 4-way intersection has 32 points of vehicle conflict due to the different maneuvers through the intersection. A roundabout has 8 points of conflict, which all occur in the same direction, reducing crash severity and likelihood of injury. Pedestrians should use the dedicated crosswalks when safely crossing, just like crossing any other intersection. At a roundabout, pedestrian crosswalks will be placed to cross each roadway leg to the roundabout, which is the same as traditional intersection crossings. The roundabout

	pedestrian crosswalk placement allows pedestrians to cross one direction of traffic a time at each roundabout approach because of the splitter island. Pedestrians should also use the designated crosswalk locations.
770	The sidewalk design has been extended from the western end of the project area along Greenbag Road to the Dorsey Avenue/Kingwood Pike intersection. At the intersection the sidewalk follows Dorsey Avenue north to Luckey Lane and east on Luckey Lane to the connection with the existing sidewalk at Mountainview Elementary School. The shoulder along the north side of Greenbag Road is being designed to accommodate bicycle use by being wider (3 feet) than the standard shoulder (2 feet). Extensions beyond the scope of this project can be considered during future planning. Roundabouts help reduce the likelihood and severity of collisions. Studies by the Federal Highway Administration (FHWA) have shown that roundabouts typically achieve reduction in overall collisions, injury collisions, fatality collisions, and pedestrian collisions. Reasons for these reductions due to the installation of a roundabout include: Low travel speeds – Drivers must slow down and yield to traffic before entering a roundabout. The reduction in speeds results in a decrease in crash severity and injury. No traffic light "to beat" – The design of a roundabout promotes a continuous circular flow of traffic. Because of this design, drivers will not have the incentive to speed up to "beat the light", like they may at a traditional intersection. One way travel – The design of a roundabout directs drivers through gently designed curves into a one-way counterclockwise circular path. This design eliminates the possibilities for T-bone and head-on collisions. In addition, a conventional 4-way intersection has 32 points of vehicle conflict due to the different maneuvers through the intersection. A roundabout has 8 points of conflict, which all occur in the same direction, reducing crash severity and likelihood of injury. Pedestrians should use the dedicated crosswalks when safely crossing, just like crossing any other intersection. At a roundabout, pedestrian crosswalks will be placed to cross each roadway leg to the roundabout, which is the same as traditional intersection crossings. The roundabout pedestrian crosswalk placement allows pedestrians to cross one direction of traffic a time at each roundabout approach because of the splitter island. Pedestrians should also use the designated crosswalk locations.
771	The option proposed here was one of the options suggested by the MMMPO study (adding left turn lanes only on Greenbag Rd at the Dorsey/Kingwood Pike) and was included on the first round of traffic analysis submitted to the WVDOH in February of 2019. This scenario also included upgrading the existing 2-phase traffic signal to 3-phases to incorporate a protected/permissive left turn phase. Installation of the turn lanes and modifying the signal phasing resulted in various approach and overall intersection LOS improvements; however, LOS C or better for

	the overall intersection operation could not be achieved. It was projected that some movements and the overall intersection would operate at an unacceptable level of service (LOS E or F). During the PM peak hour, the overall intersection is projected to operate at an overall intersection LOS E, and the eastbound through movement is forecasted to operate at a LOS F. This option would result in the Greenbag Road and Dorsey Avenue approaches queue lengths increasing. The eastbound Greenbag Road through movement queue will continue to extend past the Bluegrass Village driveway. Based on these findings and at the direction of the WVDOH, the traffic analysis was revised using additional options, which developed into Options D and E examined for the EA. The left turn lane only on Greenbag Road was not developed further and no impacts were assessed for the EA. During final design, further avoidance and/or minimization measures will be considered and/or implemented as appropriate to reduce the total impacts to streams. Specific Best Management Practices will be developed prior to construction to reduce the amount of disturbed aquatic habitat and riparian vegetation; minimize opportunities for increased sedimentation during construction; revegetate all disturbed areas to prevent accelerated erosion; designate equipment fueling and service areas away from aquatic habitats; and designate and construct all stormwater management facilities to prevent runoff. Coordination with resource agencies will continue throughout construction activities as necessary. The stormwater management plan for this project will meet the volume and rate requirements of the Morgantown Utility Board and WVDOH policies. Due to the existing topography and features it is likely that these requirements will require basins and other stormwater BMP's, such as vegetated swales. The amount of offsite runoff to the streams and wetlands will be minimized where practicable in order to limit basin size and meet the design criteria. Stormwater design for the project will be completed during final design and will minimize the impacts to the streams and wetlands located within and adjacent to the project right of way. The EA reported impacts to Federal Farmland Protection Policy Act (FPPA) soils. The entire Greenbag Road environmental study area is encompassed by "land already in or committed to urban development" as defined by the FPPA (see 7 CFR § 658.2 - Definitions) and is therefore not subject to provisions of FPPA. Please refer to the Farmland Appendix attached to the FONSI for further detail. Conscious Harvest Cooperative Community Garden, Joy and Hemp Universal LLC, and Mockingbird Hill Farms are located on private property and the property owner will be compensated for the sale of any land to the WVDOH during the right-of-way acquisition process. Impacts to this parcel have been minimized to the extent practicable. Approximately 1.56 acres (67,900 square feet) will be required from the parcel. Fair market value will be paid for all properties that require full or partial acquisition as a result of the project. When only part of the property is required, as is the case with this parcel, fair market value of the part taken will be paid, plus damages, if any, to the residue, less all benefits. West Virginia law defines "market value" as the price a willing buyer would pay a willing seller, neither acting under compulsion nor duress, both exercising prudence and intelligent judgment as to its value and familiar with the purpose for which the property is reasonably available. Fair

	market value will be determined by a competent, professional real estate appraiser after a thorough inspection of the property, a comparison with similar properties in the area that have been sold recently, a determination and consideration of its replacement cost and depreciation and consideration of the income-producing potential. All appraisal reports are office-reviewed, then rechecked in the field by experienced, qualified review appraisers for accuracy. Since the Division of Highways has adopted a firm price policy, the property owner will be offered the full amount of the approved appraisal. There will be no attempt to buy property at less than fair market value. This policy guarantees that all citizens of the state receive full value for the money expended for highway rights of way. Those who hold a valid property interest in the property that is acquired for the project will be compensated during the ROW acquisition phase. The cultural resources surveys were conducted according to the guidelines published by the WV State Historic Preservation Office. The archaeological survey included the excavation of 213 shovel test pits, one test excavation unit, and visual inspection of the entire surface area within the defined area of potential effect. Based on the SHPO guidelines, when no cultural resources are identified during the Phase I survey, an abbreviated technical report is acceptable. As the reviewing agency, the WV SHPO concurred with the recommendation that no further archaeological investigations were warranted and no archaeological historic properties are present in the study area. The historic structures survey resulted in the identification of 25 structures 45+ years old within the defined area of potential effect. Two of the resources were recommended eligible for the National Register of Historic Places and the project was designed to avoid potential impacts to these properties. As the reviewing agency, the WV SHPO concurred with the recommendation that the project would not adversely affect any NRHP eligible resources and that no further historic structures investigations were needed. The cultural resources reports are available as an Appendix to the EA on the WVDOH website at https://transportation.wv.gov/highways/engineering/comment/closed/greenbagroadimprovementproject/Pages/default.aspx. In regards to cost, since the traffic analysis determined that left turn lanes on Greenbag Road did not meet WVDOH's LOS criteria, a cost estimate was not prepared. However, long-term costs associated with roundabouts are significantly less than a traffic signal, since no electrical costs and no traffic signal maintenance are involved with a roundabout.
772	Test comment from public meeting team
773	A shared-use path was part of some early versions of the project, but the right of way impacts along Bluegrass Village and the Kennedy Center were significant. Due to these detrimental impacts the shared use path was removed from the alternatives that were advanced to the EA. The sidewalk design has been extended from the western end of the project area along Greenbag Road to the Dorsey Avenue/Kingwood Pike intersection. At the intersection the sidewalk follows Dorsey Avenue north to Luckey Lane and east on Luckey Lane to the connection with the existing sidewalk at Mountainview Elementary School. The shoulder along the north side of Greenbag Road is being designed to accommodate

	bicycle use by being wider (3 feet) than the standard shoulder (2 feet). Extensions beyond the scope of this project can be considered during future planning. Roundabouts help reduce the likelihood and severity of collisions. Studies by the Federal Highway Administration (FHWA) have shown that roundabouts typically achieve reduction in overall collisions, injury collisions, fatality collisions, and pedestrian collisions. Reasons for these reductions due to the installation of a roundabout include: Low travel speeds – Drivers must slow down and yield to traffic before entering a roundabout. The reduction in speeds results in a decrease in crash severity and injury. No traffic light "to beat" – The design of a roundabout promotes a continuous circular flow of traffic. Because of this design, drivers will not have the incentive to speed up to "beat the light", like they may at a traditional intersection. One way travel – The design of a roundabout directs drivers through gently designed curves into a one-way counterclockwise circular path. This design eliminates the possibilities for T-bone and head-on collisions. In addition, a conventional 4-way intersection has 32 points of vehicle conflict due to the different maneuvers through the intersection. A roundabout has 8 points of conflict, which all occur in the same direction, reducing crash severity and likelihood of injury. Pedestrians should use the dedicated crosswalks when safely crossing, just like crossing any other intersection. At a roundabout, pedestrian crosswalks will be placed to cross each roadway leg to the roundabout, which is the same as traditional intersection crossings. The roundabout pedestrian crosswalk placement allows pedestrians to cross one direction of traffic a time at each roundabout approach because of the splitter island. Pedestrians should also use the designated crosswalk locations. The turn lane options that were examined do not improve the level of service as much as the roundabout and the turn lanes at Dorsey Avenue/Kingwood Pike involve complete takes of 2 residences and 1 business. These takes are different from what was reported in the EA. This change will be noted in the FONSI. Adding only left turn lanes on Greenbag Road at the Dorsey/Kingwood Pike intersection was evaluated during an initial round of traffic analysis because this option had been suggested by the MPO. The option included upgrading the signal lights to have a protected/permissive left turn phase. The analysis showed that this option would result in some intersection improvements but could not achieve LOS C or better for the overall intersection operation. The overall intersection would operate at an unacceptable LOS (LOS E or F). The eastbound Greenbag Road traffic queue would extend past the Bluegrass Village Driveway. Based on these findings this option was replaced with Options D and E for the EA analysis.

	The diversion of traffic from downtown, including large trucks, is not within the scope of this project. The noise analysis report indicates the Greenbag Road and intersection improvements for this alternative do not meet the requirements for either a Type I or Type II project. The Project is classified as a Type III project and a detailed noise analysis for highway traffic noise impacts was not required. The Type III noise analysis is available as an Appendix to the EA on the WVDOH website at https://transportation.wv.gov/highways/engineering/comment/closed/greenbagroadimprovementproject/Pages/default.aspx. The EA reported impacts to Federal Farmland Protection Policy Act (FPPA) soils. The entire Greenbag Road environmental study area is encompassed by "land already in or committed to urban development" as defined by the FPPA (see 7 CFR § 658.2 - Definitions) and is therefore not subject to provisions of FPPA. Please refer to the Farmland Appendix attached to the FONSI for further detail. Moving the roundabout to the north into the former Atomic Grill location to avoid impacts to the referenced property is not feasible given the topography and approach angles. Conscious Harvest Cooperative Community Garden, Joy and Hemp Universal LLC, and Mockingbird Hill Farms are located on private property and the property owner will be compensated for the sale of any land to the WVDOH during the right-of-way acquisition process. Impacts to this parcel have been minimized to the extent practicable. Approximately 1.56 acres (67,900 square feet) will be required from the parcel. Fair market value will be paid for all properties that require full or partial acquisition as a result of the project. When only part of the property is required, as is the case with this parcel, fair market value of the part taken will be paid, plus damages, if any, to the residue, less all benefits. West Virginia law defines "market value" as the price a willing buyer would pay a willing seller, neither acting under compulsion nor duress, both exercising prudence and intelligent judgment as to its value and familiar with the purpose for which the property is reasonably available. Fair market value will be determined by a competent, professional real estate appraiser after a thorough inspection of the property, a comparison with similar properties in the area that have been sold recently, a determination and consideration of its replacement cost and depreciation and consideration of the income-producing potential. All appraisal reports are office-reviewed, then rechecked in the field by experienced, qualified review appraisers for accuracy. Since the Division of Highways has adopted a firm price policy, the property owner will be offered the full amount of the approved appraisal. There will be no attempt to buy property at less than fair market value. This policy guarantees that all citizens of the state receive full value for the money expended for highway rights of way. Those who hold a valid property interest in the property that is acquired for the project will be compensated during the ROW acquisition phase.

774	The traffic control plan will continue to be revised during final design, and will not use Aaron's Creek Road as a signed detour. The revised plan intends to utilize the center of the Dorsey/Kingwood roundabout as a temporary intersection with temporary traffic signals. A short-term detour is proposed using Summers School Road while constructing the connection of the existing Kingwood Pike with the new portion. The roundabouts were designed to accommodate AASHTO WB-62 truck configuration, which is an interstate semi-truck with a 62' wheel base between steer axle and last trailer axle, including a 48' trailer. Larger trucks can navigate the roundabout and use the internal truck apron. The turn lane options that were examined do not improve the level of service as much as the roundabout and the turn lanes at Dorsey Avenue/Kingwood Pike involve complete takes of 2 residences and 1 business. These takes are different from what was reported in the EA. This change will be noted in the FONSI. Adding only left turn lanes on Greenbag Road at the Dorsey/Kingwood Pike intersection was evaluated during an initial round of traffic analysis because this option had been suggested by the MPO. The option included upgrading the signal lights to have a protected/permissive left turn phase. The analysis showed that this option would result in some intersection improvements but could not achieve LOS C or better for the overall intersection operation. The overall intersection would operate at an unacceptable LOS (LOS E or F). The eastbound Greenbag Road traffic queue would extend past the Bluegrass Village Driveway. Based on these findings this option was replaced with Options D and E for the EA analysis. Road repair beyond the scope of this project is being addressed through the Governor's Roads to Prosperity program and progress can be tracked via the WVDOH website.
775	The sidewalk design has been extended from the western end of the project area along Greenbag Road to the Dorsey Avenue/Kingwood Pike intersection. At the intersection the sidewalk follows Dorsey Avenue north to Luckey Lane and east on Luckey Lane to the connection with the existing sidewalk at Mountainview Elementary School. The shoulder along the north side of Greenbag Road is being designed to accommodate bicycle use by being wider (3 feet) than the standard shoulder (2 feet). Extensions beyond the scope of this project can be considered during future planning. Roundabouts help reduce the likelihood and severity of collisions. Studies by the Federal Highway Administration (FHWA) have shown that roundabouts typically achieve reduction in overall collisions, injury collisions, fatality collisions, and pedestrian collisions. Reasons for these reductions due to the installation of a roundabout include: Low travel speeds – Drivers must slow down and yield to traffic before entering a roundabout. The reduction in speeds results in a decrease in crash severity and injury.

	No traffic light “to beat” – The design of a roundabout promotes a continuous circular flow of traffic. Because of this design, drivers will not have the incentive to speed up to “beat the light”, like they may at a traditional intersection. One way travel – The design of a roundabout directs drivers through gently designed curves into a one-way counterclockwise circular path. This design eliminates the possibilities for T-bone and head-on collisions. In addition, a conventional 4-way intersection has 32 points of vehicle conflict due to the different maneuvers through the intersection. A roundabout has 8 points of conflict, which all occur in the same direction, reducing crash severity and likelihood of injury. Pedestrians should use the dedicated crosswalks when safely crossing, just like crossing any other intersection. At a roundabout, pedestrian crosswalks will be placed to cross each roadway leg to the roundabout, which is the same as traditional intersection crossings. The roundabout pedestrian crosswalk placement allows pedestrians to cross one direction of traffic a time at each roundabout approach because of the splitter island. Pedestrians should also use the designated crosswalk locations.
776	The sidewalk design has been extended from the western end of the project area along Greenbag Road to the Dorsey Avenue/Kingwood Pike intersection. 	The EA reported impacts to Federal Farmland Protection Policy Act (FPPA) soils. The entire Greenbag Road environmental study area is encompassed by "land already in or committed to urban development" as defined by the FPPA (see 7 CFR § 658.2 - Definitions) and is therefore not subject to provisions of FPPA. Please refer to the Farmland Appendix attached to the FONSI for further detail. Conscious Harvest Cooperative Community Garden, Joy and Hemp Universal LLC, and Mockingbird Hill Farms are located on private property and the property owner will be compensated for the sale of any land to the WVDOH during the right-of-way acquisition process. Impacts to this parcel have been minimized to the extent practicable. Approximately 1.56 acres (67,900 square feet) will be required from the parcel. Fair market value will be paid for all properties that require full or partial acquisition as a result of the project. When only part of the property is required, as is the case with this parcel, fair market value of the part taken will be paid, plus damages, if any, to the residue, less all benefits. West Virginia law defines "market value" as the price a willing buyer would pay a willing seller, neither acting under compulsion nor duress, both exercising prudence and intelligent judgment as to its value and familiar with the purpose for which the property is reasonably available. Fair market value will be determined by a competent, professional real estate appraiser after a thorough inspection of the property, a comparison with similar properties in the area that have been sold recently, a determination and consideration of its replacement cost and depreciation and consideration of the income-producing potential. All appraisal reports are office-reviewed, then rechecked in the field by experienced, qualified review appraisers for accuracy. Since the Division of Highways has adopted a firm price policy, the property owner will be offered the full amount of the approved appraisal. There will be no attempt to buy property at less than fair market value. This policy guarantees that all citizens of the state receive full value for the money expended for highway rights of way. Those who hold a valid property interest in the property that is acquired for the project will be compensated during the ROW acquisition phase.

West Virginia law defines "market value" as the price a willing buyer would pay a willing seller, neither acting under compulsion nor duress, both exercising prudence and intelligent judgment as to its value and familiar with the purpose for which the property is reasonably available. Fair

	market value will be determined by a competent, professional real estate appraiser after a thorough inspection of the property, a comparison with similar properties in the area that have been sold recently, a determination and consideration of its replacement cost and depreciation and consideration of the income-producing potential. All appraisal reports are office-reviewed, then rechecked in the field by experienced, qualified review appraisers for accuracy. Since the Division of Highways has adopted a firm price policy, the property owner will be offered the full amount of the approved appraisal. There will be no attempt to buy property at less than fair market value. This policy guarantees that all citizens of the state receive full value for the money expended for highway rights of way. Those who hold a valid property interest in the property that is acquired for the project will be compensated during the ROW acquisition phase.
783	A shared-use path was part of some early versions of the project, but the right of way impacts along Bluegrass Village and the Kennedy Center were significant. Due to these detrimental impacts the shared use path was removed from the alternatives that were advanced to the EA. Connections of existing trails is beyond the scope of the current project. The diversion of traffic from downtown, including large trucks, is not within the scope of this project.
784	Both the MMMPO corridor study and the 2018 traffic study determined that traffic flow through the corridor is controlled by the congestion at the major intersections in the corridor. The projected growth in the Morgantown area will continue to increase traffic and congestion at the intersections if improvements do not occur. The preliminary investigation and engineering traffic study was completed to evaluate the Greenbag Road corridor, evaluating the existing and potential future operation of the intersections selected for study by WVDOH. The Greenbag Road corridor has long been recognized as a challenging roadway to navigate due to geometric deficiencies, significant intersection delays during the peak hours, and increased volume of truck traffic and development within the corridor. Several studies have been previously completed through the MMMPO, evaluating various transportation plans for the Greenbag Road corridor, with the ultimate vision of transforming Greenbag Road into a safe, efficient, and attractive multimodal transportation facility. The EA reviewed multiple alternatives including turn lanes, traffic lights, and the roundabouts. Through the analysis in the EA, the only alternative that meets the purpose and need of the project is the roundabout. The EA reported impacts to Federal Farmland Protection Policy Act (FPPA) soils. The entire Greenbag Road environmental study area is encompassed by “land already in or committed to urban development” as defined by the FPPA (see 7 CFR § 658.2 - Definitions) and is therefore not subject to provisions of FPPA. Please refer to the Farmland Appendix attached to the FONSI for further detail. Conscious Harvest Cooperative Community Garden, Joy and Hemp Universal LLC, and Mockingbird Hill Farms are located on private property and the property owner will be compensated for the sale of any land to the WVDOH during the right-of-way acquisition process. 789	A shared-use path was part of some early versions of the project, but the right of way impacts along Bluegrass Village and the Kennedy Center were significant. Due to these detrimental impacts the shared use path was removed from the alternatives that were advanced to the EA. The sidewalk design has been extended from the western end of the project area along Greenbag Road to the Dorsey Avenue/Kingwood Pike intersection. At the intersection the sidewalk follows Dorsey Avenue north to Luckey Lane and east on Luckey Lane to the connection with the existing sidewalk at Mountainview Elementary School. The shoulder along the north side of Greenbag Road is being designed to accommodate bicycle use by being wider (3 feet) than the standard shoulder (2 feet). Extensions beyond the scope of this project can be considered during future planning.

	Active transportation accommodations will be evaluated through final design. Pedestrians should use the dedicated crosswalks when safely crossing the roundabouts, just like crossing any other intersection. At a roundabout, pedestrian crosswalks will be placed to cross each roadway leg to the roundabout, which is the same as traditional intersection crossings. The roundabout pedestrian crosswalk placement allows pedestrians to cross one direction of traffic a time at each roundabout approach because of the splitter island. Pedestrians should also use the designated crosswalk locations. Roundabouts help reduce the likelihood and severity of collisions. Studies by the Federal Highway Administration (FHWA) have shown that roundabouts typically achieve reduction in overall collisions, injury collisions, fatality collisions, and pedestrian collisions. Reasons for these reductions due to the installation of a roundabout include: Low travel speeds – Drivers must slow down and yield to traffic before entering a roundabout. The reduction in speeds results in a decrease in crash severity and injury. No traffic light "to beat" – The design of a roundabout promotes a continuous circular flow of traffic. Because of this design, drivers will not have the incentive to speed up to "beat the light", like they may at a traditional intersection. One way travel – The design of a roundabout directs drivers through gently designed curves into a one-way counterclockwise circular path. This design eliminates the possibilities for T-bone and head-on collisions. In addition, a conventional 4-way intersection has 32 points of vehicle conflict due to the different maneuvers through the intersection. A roundabout has 8 points of conflict, which all occur in the same direction, reducing crash severity and likelihood of injury.
790	The preliminary investigation and engineering traffic study has examined two build alternatives and three options for each of the major intersections. The intersection options that were evaluated and analyzed include turning lanes, traffic signals, and roundabouts. WVDOH requires intersection improvements to meet or exceed an overall intersection LOS C or better during the peak hours studied for design year improvements. The times of day (peak hours) selected to be studied followed WVDOH guidelines and is standard traffic engineering practice for determining future intersection improvements. At the intersection of Greenbag Road/Dorsey Avenue/Kingwood Pike the traffic analysis determined that the intersection would operate at failure (overall intersection LOS F) if existing intersection conditions and operations were to remain the same 30-years in the future (design year) without any improvements. Adding only left turn lanes on Greenbag Road at the Dorsey/Kingwood Pike intersection was evaluated during an initial round of traffic analysis because this option had been suggested by the MPO. The option included upgrading the signal lights to have a protected/permissive left turn phase. The analysis showed that this option would result in some intersection improvements but could not

	achieve LOS C or better for the overall intersection operation. The overall intersection would operate at an unacceptable LOS (LOS E). In addition, the left turn lane option would result in the eastbound Greenbag Road traffic queue to extend past the Bluegrass Village Driveway. The traffic analysis determined that with installation of a roundabout the overall intersection would operate at a LOS C, meeting WVDOH design year criteria. Roundabouts help reduce vehicular delay and promotes a continuous flow of traffic, which increases traffic capacity at an intersection. The diversion of traffic from downtown, including large trucks, is not within the scope of this project.
791	The sidewalk design has been extended from the western end of the project area along Greenbag Road to the Dorsey Avenue/Kingwood Pike intersection. At the intersection the sidewalk follows Dorsey Avenue north to Luckey Lane and east on Luckey Lane to the connection with the existing sidewalk at Mountainview Elementary School. The shoulder along the north side of Greenbag Road is being designed to accommodate bicycle use by being wider (3 feet) than the standard shoulder (2 feet). Active transportation accommodations will be evaluated through final design. Extensions beyond the scope of this project can be considered during future planning. Pedestrians should use the dedicated crosswalks when safely crossing the roundabouts, just like crossing any other intersection. At a roundabout, pedestrian crosswalks will be placed to cross each roadway leg to the roundabout, which is the same as traditional intersection crossings. The roundabout pedestrian crosswalk placement allows pedestrians to cross one direction of traffic a time at each roundabout approach because of the splitter island. Pedestrians should also use the designated crosswalk locations. Roundabouts help reduce the likelihood and severity of collisions. Studies by the Federal Highway Administration (FHWA) have shown that roundabouts typically achieve reduction in overall collisions, injury collisions, fatality collisions, and pedestrian collisions. Reasons for these reductions due to the installation of a roundabout include: Low travel speeds – Drivers must slow down and yield to traffic before entering a roundabout. The reduction in speeds results in a decrease in crash severity and injury. No traffic light “to beat” – The design of a roundabout promotes a continuous circular flow of traffic. Because of this design, drivers will not have the incentive to speed up to “beat the light”, like they may at a traditional intersection. One way travel – The design of a roundabout directs drivers through gently designed curves into a one-way counterclockwise circular path. This design eliminates the possibilities for T-bone and head-on collisions.

	In addition, a conventional 4-way intersection has 32 points of vehicle conflict due to the different maneuvers through the intersection. A roundabout has 8 points of conflict, which all occur in the same direction, reducing crash severity and likelihood of injury.
792	The MMMPO had completed several previous studies evaluating various transportation plans for the Greenbag Road corridor, with the ultimate vision of transforming Greenbag Road into a safe, efficient, and attractive multimodal transportation facility. The scenarios determined to be evaluated in the traffic study evolved from the outcome of the MMMPO's preliminary studies and findings. Existing two-way stop controlled operations with potential roadway improvements were evaluated as part of the traffic study, as well as traffic signal and roundabout options. The option to add left turn lanes only on Greenbag Rd at the Dorsey/Kingwood Pike was one of the options suggested by the MMMPO study and was included on the first round of traffic analysis submitted to the WVDOH in February of 2019. This scenario also included upgrading the existing 2-phase traffic signal to 3-phases to incorporate a protected/permissive left turn phase. Installation of the turn lanes and modifying the signal phasing resulted in various approach and overall intersection LOS improvements; however, LOS C or better for the overall intersection operation could not be achieved. It was projected that some movements and the overall intersection would operate at an unacceptable level of service (LOS E or F). During the PM peak hour, the overall intersection is projected to operate at an overall intersection LOS E, and the eastbound through movement is forecasted to operate at a LOS F. This option would result in the Greenbag Road and Dorsey Avenue approaches queue lengths increasing. The eastbound Greenbag Road through movement queue will continue to extend past the Bluegrass Village driveway. Based on these findings and at the direction of the WVDOH, the traffic analysis was revised using additional options, which developed into Options D and E examined for the EA. The left turn lane only on Greenbag Road was not developed further and no impacts were assessed for the EA. The turn lane options that were examined in the EA do not improve the level of service as much as the roundabout and the turn lanes at Dorsey Avenue/Kingwood Pike involve complete takes of 2 residences and 1 business. These takes are different from what was reported in the EA. This change will be noted in the FONSI.
793	The EA reviewed multiple alternatives including turn lanes, traffic lights, and the roundabouts. Through the analysis in the EA, the only alternative that meets the purpose and need of the project is the roundabout. The preliminary investigation and engineering traffic study has examined two build alternatives and three options for each of the major intersections. The intersection options that were evaluated and analyzed include turning lanes, traffic signals, and roundabouts. WVDOH requires intersection improvements to meet or exceed an overall intersection LOS C or better during the peak hours studied for design year improvements. The times of day (peak hours) selected to be studied followed WVDOH guidelines and is standard traffic engineering practice for determining future intersection improvements. At the intersection of Greenbag Road/Dorsey Avenue/Kingwood Pike the traffic analysis determined that the intersection would operate at failure (overall intersection LOS F) if existing intersection conditions and operations were to remain the same 30-years in the future (design

	year) without any improvements. Adding only left turn lanes on Greenbag Road at the Dorsey/Kingwood Pike intersection was evaluated during an initial round of traffic analysis because this option had been suggested by the MPO. The option included upgrading the signal lights to have a protected/permissive left turn phase. The analysis showed that this option would result in some intersection improvements but could not achieve LOS C or better for the overall intersection operation. The overall intersection would operate at an unacceptable LOS (LOS E). In addition, the left turn lane option would result in the eastbound Greenbag Road traffic queue to extend past the Bluegrass Village Driveway. The traffic analysis determined that with installation of a roundabout the overall intersection would operate at a LOS C, meeting WVDOH design year criteria. At the intersection of Greenbag Road/Mississippi Avenue the traffic analysis determined that the intersection would operate at failure (overall intersection LOS F) if existing intersection conditions and operations were to remain the same 30-years in the future (design year) without any improvements. The design year with improvements scenarios evaluated determined that with installation of a roundabout the overall intersection would operate at a LOS A, best operating conditions, for all peak hours studied. Installation of a traffic signal with turn lanes resulted in an overall intersection LOS B during the AM peak hour, with the Mississippi Avenue approach operating at a LOS C. Though the analysis meets WVDOH minimum LOS criteria, the roundabout option exceeds WVDOH minimum LOS criteria. Roundabouts help reduce vehicular delay and promotes a continuous flow of traffic, which increases traffic capacity at an intersection.
794	The MMMPO had completed several previous studies evaluating various transportation plans for the Greenbag Road corridor, with the ultimate vision of transforming Greenbag Road into a safe, efficient, and attractive multimodal transportation facility. The future traffic along Greenbag Road, Mississippi Avenue, Dorsey Avenue, Kingwood Pike were projected for the future design year by assuming existing traffic distribution/patterns but with increased traffic volumes though application of a yearly traffic growth rate of 1.16% per year. It should be noted that the traffic evaluation was completed prior to the COVID-19 pandemic and its effects to traffic currently occurring. The scenarios determined to be evaluated in the traffic study evolved from the outcome of the MMMPO's preliminary studies and findings. Existing two-way stop controlled operations with potential roadway improvements were evaluated as part of the traffic, as well as traffic signal and roundabout options. The intersection of Greenbag Road/Dorsey Avenue/Kingwood Pike is currently controlled by a traffic signal and not by a four-way (all-way) stop, which includes stop sign control on each approach. The intersection would operate at failure (overall intersection LOS F) if existing intersection conditions and operations (traffic signal control) were to remain the same 30-years in the future (design year) without any improvements. Therefore, traffic analysis was not completed for a four-way (all-way) stop controlled intersection operations. At the intersection of Greenbag Road/Mississippi Avenue the traffic analysis determined that the intersection would operate at failure (overall intersection LOS F) if existing intersection conditions and operations were to remain the same 30-years in the future (design year) without any improvements. The design year with improvements scenarios evaluated determined that with installation of a roundabout the overall

	intersection would operate at a LOS A, best operating conditions, for all peak hours studied. Installation of a traffic signal with turn lanes resulted in an overall intersection LOS B during the AM peak hour, with the Mississippi Avenue approach operating at a LOS C. Though the analysis meets WVDOH minimum LOS criteria, the roundabout option exceeds WVDOH minimum LOS criteria. Roundabouts help reduce vehicular delay and promotes a continuous flow of traffic, which increases traffic capacity at an intersection. The EA reported impacts to Federal Farmland Protection Policy Act (FPPA) soils. The entire Greenbag Road environmental study area is encompassed by "land already in or committed to urban development" as defined by the FPPA (see 7 CFR § 658.2 - Definitions) and is therefore not subject to provisions of FPPA. Please refer to the Farmland Appendix attached to the FONSI for further detail. Conscious Harvest Cooperative Community Garden, Joy and Hemp Universal LLC, and Mockingbird Hill Farms are located on private property and the property owner will be compensated for the sale of any land to the WVDOH during the right-of-way acquisition process. Impacts to this parcel have been minimized to the extent practicable. Approximately 1.56 acres (67,900 square feet) will be required from the parcel. Fair market value will be paid for all properties that require full or partial acquisition as a result of the project. When only part of the property is required, as is the case with this parcel, fair market value of the part taken will be paid, plus damages, if any, to the residue, less all benefits. West Virginia law defines "market value" as the price a willing buyer would pay a willing seller, neither acting under compulsion nor duress, both exercising prudence and intelligent judgment as to its value and familiar with the purpose for which the property is reasonably available. Fair market value will be determined by a competent, professional real estate appraiser after a thorough inspection of the property, a comparison with similar properties in the area that have been sold recently, a determination and consideration of its replacement cost and depreciation and consideration of the income-producing potential. All appraisal reports are office-reviewed, then rechecked in the field by experienced, qualified review appraisers for accuracy. Since the Division of Highways has adopted a firm price policy, the property owner will be offered the full amount of the approved appraisal. There will be no attempt to buy property at less than fair market value. This policy guarantees that all citizens of the state receive full value for the money expended for highway rights of way. Those who hold a valid property interest in the property that is acquired for the project will be compensated during the ROW acquisition phase.
795	The MMMPO had completed several previous studies evaluating various transportation plans for the Greenbag Road corridor, with the ultimate vision of transforming Greenbag Road into a safe, efficient, and attractive multimodal transportation facility. The future traffic along Greenbag Road, Mississippi Avenue, Dorsey Avenue, Kingwood Pike were projected for the future design year by assuming existing traffic distribution/patterns but with increased traffic volumes though application of a yearly traffic growth rate of 1.16% per year. Though the analysis meets WVDOH minimum LOS criteria, the roundabout option exceeds WVDOH minimum LOS criteria. Roundabouts help reduce vehicular delay and promotes a continuous flow of traffic, which increases traffic capacity at an intersection.
797	Road repair beyond the scope of this project is being addressed through the Governor's Roads to Prosperity program and progress can be tracked via the WVDOH website.
798	One of the major differences between Greenbag Road and the Mileground is the volume of traffic. Greenbag Road has less than half the traffic volume that Mileground has. A second major difference is the general configuration of the roundabouts. The proposed roundabouts on Greenbag are more straightforward and more traditional roundabout designs, without all of the confusing lanes that are present at Mileground. The roundabouts on Greenbag Road will be more intuitive for drivers. The WVDOH has an educational video on how to use a roundabout available for viewing at https://www.youtube.com/watch?v=7njH4MKyo0w. The EA reported impacts to Federal Farmland Protection Policy Act (FPPA) soils. The entire Greenbag Road environmental study area is encompassed by “land already in or committed to urban development” as defined by the FPPA (see 7 CFR § 658.2 - Definitions) and is therefore not subject to provisions of FPPA. Please refer to the Farmland Appendix attached to the FONSI for further detail.

	Conscious Harvest Cooperative Community Garden, Joy and Hemp Universal LLC, and Mockingbird Hill Farms are located on private property and the property owner will be compensated for the sale of any land to the WVDOH during the right-of-way acquisition process. Impacts to this parcel have been minimized to the extent practicable. Approximately 1.56 acres (67,900 square feet) will be required from the parcel. Fair market value will be paid for all properties that require full or partial acquisition as a result of the project. When only part of the property is required, as is the case with this parcel, fair market value of the part taken will be paid, plus damages, if any, to the residue, less all benefits. West Virginia law defines "market value" as the price a willing buyer would pay a willing seller, neither acting under compulsion nor duress, both exercising prudence and intelligent judgment as to its value and familiar with the purpose for which the property is reasonably available. Fair market value will be determined by a competent, professional real estate appraiser after a thorough inspection of the property, a comparison with similar properties in the area that have been sold recently, a determination and consideration of its replacement cost and depreciation and consideration of the income-producing potential. All appraisal reports are office-reviewed, then rechecked in the field by experienced, qualified review appraisers for accuracy. Since the Division of Highways has adopted a firm price policy, the property owner will be offered the full amount of the approved appraisal. There will be no attempt to buy property at less than fair market value. This policy guarantees that all citizens of the state receive full value for the money expended for highway rights of way. Those who hold a valid property interest in the property that is acquired for the project will be compensated during the ROW acquisition phase. Road repair beyond the scope of this project is being addressed through the Governor's Roads to Prosperity program and progress can be tracked via the WVDOH website. The traffic control plan will continue to be revised during final design, and will not use Aaron's Creek Road as a signed detour. The revised plan intends to utilize the center of the Dorsey/Kingwood roundabout as a temporary intersection with temporary traffic signals. A short-term detour is proposed using Summers School Road while constructing the connection of the existing Kingwood Pike with the new portion.
799	The roundabouts were designed to accommodate AASHTO WB-62 truck configuration, which is an interstate semi-truck with a 62' wheel base between steer axle and last trailer axle, including a 48' trailer. Larger trucks can navigate the roundabout and use the internal truck apron.
800	A shared-use path was part of some early versions of the project, but the right of way impacts along Bluegrass Village and the Kennedy Center were significant. Due to these detrimental impacts the shared use path was removed from the alternatives that were advanced to the EA. The sidewalk design has been extended from the western end of the project area along Greenbag Road to the Dorsey Avenue/Kingwood Pike intersection. At the intersection the sidewalk follows Dorsey Avenue north to Luckey Lane and east on Luckey Lane to the connection with the existing sidewalk at Mountainview Elementary School. The shoulder along the north side of Greenbag Road is being designed to accommodate bicycle use by being wider (3 feet) than the standard shoulder (2 feet). Extensions beyond the scope of this project can be considered during

	future planning. Thank you for enumerating the safety concerns and the proposed HAWK beacon. The WVDOH will examine all safety concerns as part of the final design. Active transportation accommodations will be evaluated through final design. Pedestrians should use the dedicated crosswalks when safely crossing the roundabouts, just like crossing any other intersection. At a roundabout, pedestrian crosswalks will be placed to cross each roadway leg to the roundabout, which is the same as traditional intersection crossings. The roundabout pedestrian crosswalk placement allows pedestrians to cross one direction of traffic a time at each roundabout approach because of the splitter island. Pedestrians should also use the designated crosswalk locations. Roundabouts help reduce the likelihood and severity of collisions. Studies by the Federal Highway Administration (FHWA) have shown that roundabouts typically achieve reduction in overall collisions, injury collisions, fatality collisions, and pedestrian collisions. Reasons for these reductions due to the installation of a roundabout include: Low travel speeds – Drivers must slow down and yield to traffic before entering a roundabout. The reduction in speeds results in a decrease in crash severity and injury. No traffic light "to beat" – The design of a roundabout promotes a continuous circular flow of traffic. Because of this design, drivers will not have the incentive to speed up to "beat the light", like they may at a traditional intersection. One way travel – The design of a roundabout directs drivers through gently designed curves into a one-way counterclockwise circular path. This design eliminates the possibilities for T-bone and head-on collisions. In addition, a conventional 4-way intersection has 32 points of vehicle conflict due to the different maneuvers through the intersection. A roundabout has 8 points of conflict, which all occur in the same direction, reducing crash severity and likelihood of injury. Conscious Harvest Cooperative Community Garden, Joy and Hemp Universal LLC, and Mockingbird Hill Farms are located on private property and the property owner will be compensated for the sale of any land to the WVDOH during the right-of-way acquisition process. Impacts to this parcel have been minimized to the extent practicable. Approximately 1.56 acres (67,900 square feet) will be required from the parcel. Fair market value will be paid for all properties that require full or partial acquisition as a result of the project. When only part of the property is required, as is the case with this parcel, fair market value of the part taken will be paid, plus damages, if any, to the residue, less all benefits. West Virginia law defines "market value" as the price a willing buyer would pay a willing seller, neither acting under compulsion nor duress, both exercising prudence and intelligent judgment as to its value and familiar with the purpose for which the property is reasonably available. Fair

	market value will be determined by a competent, professional real estate appraiser after a thorough inspection of the property, a comparison with similar properties in the area that have been sold recently, a determination and consideration of its replacement cost and depreciation and consideration of the income-producing potential. All appraisal reports are office-reviewed, then rechecked in the field by experienced, qualified review appraisers for accuracy. Since the Division of Highways has adopted a firm price policy, the property owner will be offered the full amount of the approved appraisal. There will be no attempt to buy property at less than fair market value. This policy guarantees that all citizens of the state receive full value for the money expended for highway rights of way. Those who hold a valid property interest in the property that is acquired for the project will be compensated during the ROW acquisition phase.
801	The preliminary investigation and engineering traffic study has examined two build alternatives and three options for each of the major intersections. The intersection options that were evaluated and analyzed include turning lanes, traffic signals, and roundabouts. WVDOH requires intersection improvements to meet or exceed an overall intersection LOS C or better during the peak hours studied for design year improvements. The times of day (peak hours) selected to be studied followed WVDOH guidelines and is standard traffic engineering practice for determining future intersection improvements. The future traffic along Greenbag Road, Mississippi Avenue, Dorsey Avenue, Kingwood Pike were projected for the future design year by assuming existing traffic distribution/patterns but with increased traffic volumes though application of a yearly traffic growth rate of 1.16% per year. It should be noted that the traffic evaluation was completed prior to the COVID-19 pandemic and its effects to traffic currently occurring. At the intersection of Greenbag Road/Dorsey Avenue/Kingwood Pike the traffic analysis determined that the intersection would operate at failure (overall intersection LOS F) if existing intersection conditions and operations were to remain the same 30-years in the future (design year) without any improvements. Adding only left turn lanes on Greenbag Road at the Dorsey/Kingwood Pike intersection was evaluated during an initial round of traffic analysis because this option had been suggested by the MPO. The option included upgrading the signal lights to have a protected/permissive left turn phase. The analysis showed that this option would result in some intersection improvements but could not achieve LOS C or better for the overall intersection operation. The overall intersection would operate at an unacceptable LOS (LOS E). In addition, the left turn lane option would result in the eastbound Greenbag Road traffic queue to extend past the Bluegrass Village Driveway. The traffic analysis determined that with installation of a roundabout the overall intersection would operate at a LOS C, meeting WVDOH design year criteria. The intersection of Greenbag Road/Dorsey Avenue/Kingwood Pike is currently controlled by a traffic signal and not by a four-way (all-way) stop, which includes stop sign control on each approach. The intersection would operate at failure (overall intersection LOS F) if existing intersection conditions and operations (traffic signal control) were to remain the same 30-years in the future (design year) without any improvements. Therefore, traffic analysis was not completed for a four-way (all-way) stop controlled intersection operations

802	A shared-use path was part of some early versions of the project, but the right of way impacts along Bluegrass Village and the Kennedy Center were significant. Due to these detrimental impacts the shared use path was removed from the alternatives that were advanced to the EA. The sidewalk design has been extended from the western end of the project area along Greenbag Road to the Dorsey Avenue/Kingwood Pike intersection. At the intersection the sidewalk follows Dorsey Avenue north to Luckey Lane and east on Luckey Lane to the connection with the existing sidewalk at Mountainview Elementary School. The shoulder along the north side of Greenbag Road is being designed to accommodate bicycle use by being wider (3 feet) than the standard shoulder (2 feet). Extensions beyond the scope of this project can be considered during future planning. Thank you for enumerating the safety concerns and the proposed pedestrian hybrid beacon. The WVDOH will examine all safety concerns as part of the final design. Pedestrians should use the dedicated crosswalks when safely crossing the roundabouts, just like crossing any other intersection. At a roundabout, pedestrian crosswalks will be placed to cross each roadway leg to the roundabout, which is the same as traditional intersection crossings. The roundabout pedestrian crosswalk placement allows pedestrians to cross one direction of traffic a time at each roundabout approach because of the splitter island. Pedestrians should also use the designated crosswalk locations. Roundabouts help reduce the likelihood and severity of collisions. Studies by the Federal Highway Administration (FHWA) have shown that roundabouts typically achieve reduction in overall collisions, injury collisions, fatality collisions, and pedestrian collisions. Reasons for these reductions due to the installation of a roundabout include: Low travel speeds – Drivers must slow down and yield to traffic before entering a roundabout. The reduction in speeds results in a decrease in crash severity and injury. No traffic light “to beat” – The design of a roundabout promotes a continuous circular flow of traffic. Because of this design, drivers will not have the incentive to speed up to “beat the light”, like they may at a traditional intersection. One way travel – The design of a roundabout directs drivers through gently designed curves into a one-way counterclockwise circular path. This design eliminates the possibilities for T-bone and head-on collisions. In addition, a conventional 4-way intersection has 32 points of vehicle conflict due to the different maneuvers through the intersection. A roundabout has 8 points of conflict, which all occur in the same direction, reducing crash severity and likelihood of injury.
803	The turn lane options that were examined do not improve the level of service as much as the roundabout and the turn lanes at Dorsey Avenue/Kingwood Pike involve complete takes of 2 residences and 1 business. This change will be noted in the FONSI. Adding only left turn

	lanes on Greenbag Road at the Dorsey/Kingwood Pike intersection was evaluated during an initial round of traffic analysis because this option had been suggested by the MPO. The option included upgrading the signal lights to have a protected/permissive left turn phase. The analysis showed that this option would result in some intersection improvements but could not achieve LOS C or better for the overall intersection operation. The overall intersection would operate at an unacceptable LOS (LOS E or F). The eastbound Greenbag Road traffic queue would extend past the Bluegrass Village Driveway. Based on these findings this option was replaced with Options D and E for the EA analysis. The EA reported impacts to Federal Farmland Protection Policy Act (FPPA) soils. The entire Greenbag Road environmental study area is encompassed by "land already in or committed to urban development" as defined by the FPPA (see 7 CFR § 658.2 - Definitions) and is therefore not subject to provisions of FPPA. Please refer to the Farmland Appendix attached to the FONSI for further detail. Conscious Harvest Cooperative Community Garden, Joy and Hemp Universal LLC, and Mockingbird Hill Farms are located on private property and the property owner will be compensated for the sale of any land to the WVDOH during the right-of-way acquisition process. Impacts to this parcel have been minimized to the extent practicable. Approximately 1.56 acres (67,900 square feet) will be required from the parcel. Fair market value will be paid for all properties that require full or partial acquisition as a result of the project. When only part of the property is required, as is the case with this parcel, fair market value of the part taken will be paid, plus damages, if any, to the residue, less all benefits. West Virginia law defines "market value" as the price a willing buyer would pay a willing seller, neither acting under compulsion nor duress, both exercising prudence and intelligent judgment as to its value and familiar with the purpose for which the property is reasonably available. Fair market value will be determined by a competent, professional real estate appraiser after a thorough inspection of the property, a comparison with similar properties in the area that have been sold recently, a determination and consideration of its replacement cost and depreciation and consideration of the income-producing potential. All appraisal reports are office-reviewed, then rechecked in the field by experienced, qualified review appraisers for accuracy. Since the Division of Highways has adopted a firm price policy, the property owner will be offered the full amount of the approved appraisal. There will be no attempt to buy property at less than fair market value. This policy guarantees that all citizens of the state receive full value for the money expended for highway rights of way. Those who hold a valid property interest in the property that is acquired for the project will be compensated during the ROW acquisition phase. Changes to the interstate access in Morgantown are beyond the scope of the current project. Road repair beyond the scope of this project is being addressed through the Governor's Roads to Prosperity program and progress can be tracked via the WVDOH website.
804	Those who hold a valid property interest in the property that is acquired for the project will be compensated during the ROW acquisition phase.

805	The EA reported impacts to Federal Farmland Protection Policy Act (FPPA) soils. The entire Greenbag Road environmental study area is encompassed by "land already in or committed to urban development" as defined by the FPPA (see 7 CFR § 658.2 - Definitions) and is therefore not subject to provisions of FPPA. Please refer to the Farmland Appendix attached to the FONSI for further detail. Conscious Harvest Cooperative Community Garden, Joy and Hemp Universal LLC, and Mockingbird Hill Farms are located on private property and the property owner will be compensated for the sale of any land to the WVDOH during the right-of-way acquisition process. Impacts to this parcel have been minimized to the extent practicable. Approximately 1.56 acres (67,900 square feet) will be required from the parcel. Fair market value will be paid for all properties that require full or partial acquisition as a result of the project. When only part of the property is required, as is the case with this parcel, fair market value of the part taken will be paid, plus damages, if any, to the residue, less all benefits. West Virginia law defines "market value" as the price a willing buyer would pay a willing seller, neither acting under compulsion nor duress, both exercising prudence and intelligent judgment as to its value and familiar with the purpose for which the property is reasonably available. Fair market value will be determined by a competent, professional real estate appraiser after a thorough inspection of the property, a comparison with similar properties in the area that have been sold recently, a determination and consideration of its replacement cost and depreciation and consideration of the income-producing potential. All appraisal reports are office-reviewed, then rechecked in the field by experienced, qualified review appraisers for accuracy. Since the Division of Highways has adopted a firm price policy, the property owner will be offered the full amount of the approved appraisal. There will be no attempt to buy property at less than fair market value. This policy guarantees that all citizens of the state receive full value for the money expended for highway rights of way. Those who hold a valid property interest in the property that is acquired for the project will be compensated during the ROW acquisition phase. The EA analysis included evaluation of potential impacts to numerous categories including natural resources, cultural resources, land use, indirect, and cumulative effects. More information is available as an Appendix to the EA on the WVDOH website at https://transportation.wv.gov/highways/engineering/comment/closed/greenbagroadimprovementproject/Pages/default.aspx. The cultural resources surveys were conducted according to the guidelines published by the WV State Historic Preservation Office. The archaeological survey included the excavation of 213 shovel test pits, one test excavation unit, and visual inspection of the entire surface area within the defined area of potential effect. Based on the SHPO guidelines, when no cultural resources are identified during the Phase I survey, an abbreviated technical report is acceptable. As the reviewing agency, the WV SHPO concurred with the recommendation that no further archaeological investigations were warranted and no archaeological historic properties are present in the study area. The historic structures survey resulted in the identification of 25 structures 45+ years old within the defined area of potential effect. Two of the resources were recommended eligible for the National Register of Historic Places and the project was designed to avoid potential impacts to these properties. As the reviewing agency, the WV SHPO concurred with the recommendation that the project would not adversely affect any NRHP eligible

	resources and that no further historic structures investigations were needed. The cultural resources reports are available as an Appendix to the EA on the WVDOH website at the link listed above.
806	The EA reported impacts to Federal Farmland Protection Policy Act (FPPA) soils. The entire Greenbag Road environmental study area is encompassed by "land already in or committed to urban development" as defined by the FPPA (see 7 CFR § 658.2 - Definitions) and is therefore not subject to provisions of FPPA. Please refer to the Farmland Appendix attached to the FONSI for further detail. Conscious Harvest Cooperative Community Garden, Joy and Hemp Universal LLC, and Mockingbird Hill Farms are located on private property and the property owner will be compensated for the sale of any land to the WVDOH during the right-of-way acquisition process. Impacts to this parcel have been minimized to the extent practicable. Approximately 1.56 acres (67,900 square feet) will be required from the parcel. Fair market value will be paid for all properties that require full or partial acquisition as a result of the project. When only part of the property is required, as is the case with this parcel, fair market value of the part taken will be paid, plus damages, if any, to the residue, less all benefits. West Virginia law defines "market value" as the price a willing buyer would pay a willing seller, neither acting under compulsion nor duress, both exercising prudence and intelligent judgment as to its value and familiar with the purpose for which the property is reasonably available. Fair market value will be determined by a competent, professional real estate appraiser after a thorough inspection of the property, a comparison with similar properties in the area that have been sold recently, a determination and consideration of its replacement cost and depreciation and consideration of the income-producing potential. All appraisal reports are office-reviewed, then rechecked in the field by experienced, qualified review appraisers for accuracy. Since the Division of Highways has adopted a firm price policy, the property owner will be offered the full amount of the approved appraisal. There will be no attempt to buy property at less than fair market value. This policy guarantees that all citizens of the state receive full value for the money expended for highway rights of way. Those who hold a valid property interest in the property that is acquired for the project will be compensated during the ROW acquisition phase. The EA analysis included evaluation of potential impacts to numerous categories including natural resources, cultural resources, land use, indirect, and cumulative effects. More information is available as an Appendix to the EA on the WVDOH website at https://transportation.wv.gov/highways/engineering/comment/closed/greenbagroadimprovementproject/Pages/default.aspx. The cultural resources surveys were conducted according to the guidelines published by the WV State Historic Preservation Office. The archaeological survey included the excavation of 213 shovel test pits, one test excavation unit, and visual inspection of the entire surface area within the defined area of potential effect. Based on the SHPO guidelines, when no cultural resources are identified during the Phase I survey, an abbreviated technical report is acceptable. As the reviewing agency, the WV SHPO concurred with the recommendation that no further archaeological investigations were warranted and no archaeological historic properties are present in the study area. The historic structures

	survey resulted in the identification of 25 structures 45+ years old within the defined area of potential effect. Two of the resources were recommended eligible for the National Register of Historic Places and the project was designed to avoid potential impacts to these properties. As the reviewing agency, the WV SHPO concurred with the recommendation that the project would not adversely affect any NRHP eligible resources and that no further historic structures investigations were needed. The cultural resources reports are available as an Appendix to the EA on the WVDOH website at https://transportation.wv.gov/highways/engineering/comment/closed/greenbagroadimprovementproject/Pages/default.aspx.
807	The sidewalk design has been extended from the western end of the project area along Greenbag Road to the Dorsey Avenue/Kingwood Pike intersection. At the intersection the sidewalk follows Dorsey Avenue north to Luckey Lane and east on Luckey Lane to the connection with the existing sidewalk at Mountainview Elementary School. The shoulder along the north side of Greenbag Road is being designed to accommodate bicycle use by being wider (3 feet) than the standard shoulder (2 feet). Extensions beyond the scope of this project can be considered during future planning. Active transportation accommodations will be evaluated through final design. Pedestrians should use the dedicated crosswalks when safely crossing the roundabouts, just like crossing any other intersection. At a roundabout, pedestrian crosswalks will be placed to cross each roadway leg to the roundabout, which is the same as traditional intersection crossings. The roundabout pedestrian crosswalk placement allows pedestrians to cross one direction of traffic a time at each roundabout approach because of the splitter island. Pedestrians should also use the designated crosswalk locations. Roundabouts help reduce the likelihood and severity of collisions. Studies by the Federal Highway Administration (FHWA) have shown that roundabouts typically achieve reduction in overall collisions, injury collisions, fatality collisions, and pedestrian collisions. Reasons for these reductions due to the installation of a roundabout include: Low travel speeds – Drivers must slow down and yield to traffic before entering a roundabout. The reduction in speeds results in a decrease in crash severity and injury. No traffic light “to beat” – The design of a roundabout promotes a continuous circular flow of traffic. Because of this design, drivers will not have the incentive to speed up to “beat the light”, like they may at a traditional intersection. One way travel – The design of a roundabout directs drivers through gently designed curves into a one-way counterclockwise circular path. This design eliminates the possibilities for T-bone and head-on collisions.

	In addition, a conventional 4-way intersection has 32 points of vehicle conflict due to the different maneuvers through the intersection. A roundabout has 8 points of conflict, which all occur in the same direction, reducing crash severity and likelihood of injury.
808	A shared-use path was part of some early versions of the project, but the right of way impacts along Bluegrass Village and the Kennedy Center were significant. Due to these detrimental impacts the shared use path was removed from the alternatives that were advanced to the EA. The sidewalk design has been extended from the western end of the project area along Greenbag Road to the Dorsey Avenue/Kingwood Pike intersection. At the intersection the sidewalk follows Dorsey Avenue north to Luckey Lane and east on Luckey Lane to the connection with the existing sidewalk at Mountainview Elementary School. The shoulder along the north side of Greenbag Road is being designed to accommodate bicycle use by being wider (3 feet) than the standard shoulder (2 feet). Extensions beyond the scope of this project can be considered during future planning. Active transportation accommodations will be evaluated through final design. Pedestrians should use the dedicated crosswalks when safely crossing the roundabouts, just like crossing any other intersection. At a roundabout, pedestrian crosswalks will be placed to cross each roadway leg to the roundabout, which is the same as traditional intersection crossings. The roundabout pedestrian crosswalk placement allows pedestrians to cross one direction of traffic a time at each roundabout approach because of the splitter island. Pedestrians should also use the designated crosswalk locations. Roundabouts help reduce the likelihood and severity of collisions. Studies by the Federal Highway Administration (FHWA) have shown that roundabouts typically achieve reduction in overall collisions, injury collisions, fatality collisions, and pedestrian collisions. Reasons for these reductions due to the installation of a roundabout include: Low travel speeds – Drivers must slow down and yield to traffic before entering a roundabout. The reduction in speeds results in a decrease in crash severity and injury. No traffic light “to beat” – The design of a roundabout promotes a continuous circular flow of traffic. Because of this design, drivers will not have the incentive to speed up to “beat the light”, like they may at a traditional intersection. One way travel – The design of a roundabout directs drivers through gently designed curves into a one-way counterclockwise circular path. This design eliminates the possibilities for T-bone and head-on collisions. In addition, a conventional 4-way intersection has 32 points of vehicle conflict due to the different maneuvers through the intersection. A roundabout has 8 points of conflict, which all occur in the same direction, reducing crash severity and likelihood of injury.

809	The EA reported impacts to Federal Farmland Protection Policy Act (FPPA) soils. The entire Greenbag Road environmental study area is encompassed by "land already in or committed to urban development" as defined by the FPPA (see 7 CFR § 658.2 - Definitions) and is therefore not subject to provisions of FPPA. Please refer to the Farmland Appendix attached to the FONSI for further detail. Conscious Harvest Cooperative Community Garden, Joy and Hemp Universal LLC, and Mockingbird Hill Farms are located on private property and the property owner will be compensated for the sale of any land to the WVDOH during the right-of-way acquisition process. Impacts to this parcel have been minimized to the extent practicable. Approximately 1.56 acres (67,900 square feet) will be required from the parcel. Fair market value will be paid for all properties that require full or partial acquisition as a result of the project. When only part of the property is required, as is the case with this parcel, fair market value of the part taken will be paid, plus damages, if any, to the residue, less all benefits. West Virginia law defines "market value" as the price a willing buyer would pay a willing seller, neither acting under compulsion nor duress, both exercising prudence and intelligent judgment as to its value and familiar with the purpose for which the property is reasonably available. Fair market value will be determined by a competent, professional real estate appraiser after a thorough inspection of the property, a comparison with similar properties in the area that have been sold recently, a determination and consideration of its replacement cost and depreciation and consideration of the income-producing potential. All appraisal reports are office-reviewed, then rechecked in the field by experienced, qualified review appraisers for accuracy. Since the Division of Highways has adopted a firm price policy, the property owner will be offered the full amount of the approved appraisal. There will be no attempt to buy property at less than fair market value. This policy guarantees that all citizens of the state receive full value for the money expended for highway rights of way. Those who hold a valid property interest in the property that is acquired for the project will be compensated during the ROW acquisition phase. The EA analysis included evaluation of potential impacts to numerous categories including natural resources, cultural resources, land use, indirect, and cumulative effects. More information is available as an Appendix to the EA on the WVDOH website at https://transportation.wv.gov/highways/engineering/comment/closed/greenbagroadimprovementproject/Pages/default.aspx. The noise analysis report indicates the Greenbag Road and intersection improvements for this alternative do not meet the requirements for either a Type I or Type II project. The Project is classified as a Type III project and a detailed noise analysis for highway traffic noise impacts was not required. The Type III noise analysis is available as an Appendix to the EA on the WVDOH website at the link listed above. The proposed project includes improvements to an existing transportation facility and the construction of the project is not expected to stimulate secondary growth, affect land use decisions, or induce land use change. Therefore, the project is not expected to result in light pollution impacts that are significantly worse than conditions currently present within the project area. The lighting layout for the roundabout will be

	developed during final design. The lighting will be designed to attempt to minimize light pollution while maintaining FHWA and WVDOH standards and requirements for lighting of the roundabout.
810	Findings from the Environmental studies (aquatic resources such as streams and wetlands; rare, threatened and endangered species of plants and animals; floodplains; farmlands; groundwater; hazardous materials; air quality; and noise) that were conducted to evaluate impacts associated with the proposed project are documented in the EA. The aquatic resources study was conducted based on the guiding manuals for wetland and stream identification. The wetland study adhered to the USACE Corps of Engineers Wetland Delineation Manual and the Regional Supplement to the Corps of Engineers Wetland Delineation Manual: Eastern Mountains and Piedmont Region. The stream identification and classification was based on the definitions from Title 46 and the West Virginia Surface Mining Rules. The study identified and delineated 8 palustrine wetlands and 13 jurisdictional watercourses within the project study area. Any changes to aquatic resource impacts in final design will be identified and included in the mitigation plan. The EA identifies wetland impacts for each alternative analyzed. Wetland impacts for alternative 1 are 0.06 acres (Palustrine Emergent 0.01 acres and Palustrine Forested 0.05 acres) and 0.05 acres for Alternative 2 (Palustrine Emergent 0.01 acres and Palustrine Forested 0.04 acres). Wetland impacts were additionally calculated for each of the intersection options: Option A is 0.05 acres (Palustrine Emergent), Option B is 0.05 acres (Palustrine Emergent) and Option C is 0.05 acres (Palustrine Emergent). No wetland impacts were identified for Options D, E, and F. The EA for the project identifies the intermittent and permanent stream impacts for each alternative analyzed. The stream impacts were determined for the EA based on the limit of disturbance provided and did not include culverted, relocated or stream loss lengths. The type of intermittent and permanent stream impacts identified for each alternative are similar. The total stream impacts for Option A is 500 LF and Options B and C are 521 LF. The total stream impacts for Option D is 428 LF, Option B is 433 LF and Option C is 453 LF. The level of detail to determine the type of stream impact including culverted, relocated, and stream loss, for the preferred alternative will be further analyzed in Final design. Options to further reduce impacts to the streams for the preferred alternative will need to be considered during Final Design. The analysis for water quality and quantity will also be further analyzed during Final Design. A detailed stream assessment will also be performed for the streams that will be impacted for the preferred alternative. Coordination with the DEP and the USACE will occur in final design and the applicable waterway permit will be obtained for the project. During final design, further avoidance and/or minimization measures will be considered and/or implemented as appropriate to reduce the total impacts to streams. Specific Best Management Practices will be developed prior to construction to reduce the amount of disturbed aquatic habitat and riparian vegetation; minimize opportunities for increased sedimentation during construction; revegetate all disturbed areas to prevent accelerated erosion; designate equipment fueling and service areas away from aquatic habitats; and designate and construct all

	stormwater management facilities to prevent runoff. Coordination with resource agencies will continue throughout construction activities as necessary. The stormwater management plan for this project will meet the volume and rate requirements of the Morgantown Utility Board and WVDOH policies. Due to the existing topography and features it is likely that these requirements will require basins and other stormwater BMP's, such as vegetated swales. The amount of offsite runoff to the streams and wetlands will be minimized where practicable in order to limit basin size and meet the design criteria. Stormwater design for the project will be completed during final design and will minimize the impacts to the streams and wetlands located within and adjacent to the project right of way. The EA reported impacts to Federal Farmland Protection Policy Act (FPPA) soils. The entire Greenbag Road environmental study area is encompassed by "land already in or committed to urban development" as defined by the FPPA (see 7 CFR § 658.2 - Definitions) and is therefore not subject to provisions of FPPA. Please refer to the Farmland Appendix attached to the FONSI for further detail. Conscious Harvest Cooperative Community Garden, Joy and Hemp Universal LLC, and Mockingbird Hill Farms are located on private property and the property owner will be compensated for the sale of any land to the WVDOH during the right-of-way acquisition process. Impacts to this parcel have been minimized to the extent practicable. Approximately 1.56 acres (67,900 square feet) will be required from the parcel. Fair market value will be paid for all properties that require full or partial acquisition as a result of the project. When only part of the property is required, as is the case with this parcel, fair market value of the part taken will be paid, plus damages, if any, to the residue, less all benefits. West Virginia law defines "market value" as the price a willing buyer would pay a willing seller, neither acting under compulsion nor duress, both exercising prudence and intelligent judgment as to its value and familiar with the purpose for which the property is reasonably available. Fair market value will be determined by a competent, professional real estate appraiser after a thorough inspection of the property, a comparison with similar properties in the area that have been sold recently, a determination and consideration of its replacement cost and depreciation and consideration of the income-producing potential. All appraisal reports are office-reviewed, then rechecked in the field by experienced, qualified review appraisers for accuracy. Since the Division of Highways has adopted a firm price policy, the property owner will be offered the full amount of the approved appraisal. There will be no attempt to buy property at less than fair market value. This policy guarantees that all citizens of the state receive full value for the money expended for highway rights of way. Those who hold a valid property interest in the property that is acquired for the project will be compensated during the ROW acquisition phase. Adding only left turn lanes on Greenbag Road at the Dorsey/Kingwood Pike intersection was evaluated during an initial round of traffic analysis because this option had been suggested by the MPO. The option included upgrading the signal lights to have a protected/permissive left turn phase. The analysis showed that this option would result in some intersection improvements but could not achieve LOS C or better for the

	overall intersection operation. It should be noted that LOS C is WVDOH's design year level of service criteria threshold for intersection improvements. The overall intersection would operate at an unacceptable level of service (LOS E). In addition, the left turn lane option would result in the eastbound Greenbag Road traffic queue to extend past the Bluegrass Village Driveway.
811	Findings from the Environmental studies (aquatic resources such as streams and wetlands; rare, threatened and endangered species of plants and animals; floodplains; farmlands; groundwater; hazardous materials; air quality; and noise) that were conducted to evaluate impacts associated with the proposed project are documented in the EA. The aquatic resources study was conducted based on the guiding manuals for wetland and stream identification. The wetland study adhered to the USACE Corps of Engineers Wetland Delineation Manual and the Regional Supplement to the Corps of Engineers Wetland Delineation Manual: Eastern Mountains and Piedmont Region. The stream identification and classification was based on the definitions from Title 46 and the West Virginia Surface Mining Rules. The study identified and delineated 8 palustrine wetlands and 13 jurisdictional watercourses within the project study area. Any changes to aquatic resource impacts in final design will be identified and included in the mitigation plan. The EA identifies wetland impacts for each alternative analyzed. Wetland impacts for alternative 1 are 0.06 acres (Palustrine Emergent 0.01 acres and Palustrine Forested 0.05 acres) and 0.05 acres for Alternative 2 (Palustrine Emergent 0.01 acres and Palustrine Forested 0.04 acres). Wetland impacts were additionally calculated for each of the intersection options: Option A is 0.05 acres (Palustrine Emergent), Option B is 0.05 acres (Palustrine Emergent) and Option C is 0.05 acres (Palustrine Emergent). No wetland impacts were identified for Options D, E, and F. The EA for the project identifies the intermittent and permanent stream impacts for each alternative analyzed. The stream impacts were determined for the EA based on the limit of disturbance provided and did not include culverted, relocated or stream loss lengths. The type of intermittent and permanent stream impacts identified for each alternative are similar. The total stream impacts for Option A is 500 LF and Options B and C are 521 LF. The total stream impacts for Option D is 428 LF, Option B is 433 LF and Option C is 453 LF. The level of detail to determine the type of stream impact including culverted, relocated, and stream loss, for the preferred alternative will be further analyzed in Final design. Options to further reduce impacts to the streams for the preferred alternative will need to be considered during Final Design. The analysis for water quality and quantity will also be further analyzed during Final Design. Specific Best Management Practices will be developed prior to construction to reduce the amount of disturbed aquatic habitat and riparian vegetation; minimize opportunities for increased sedimentation during construction; revegetate all disturbed areas to prevent accelerated erosion; designate equipment fueling and service areas away from aquatic habitats; and designate and construct all

	stormwater management facilities to prevent runoff. Coordination with resource agencies will continue throughout construction activities as necessary. The stormwater management plan for this project will meet the volume and rate requirements of the Morgantown Utility Board and WVDOH policies. Due to the existing topography and features it is likely that these requirements will require basins and other stormwater BMP's, such as vegetated swales. The amount of offsite runoff to the streams and wetlands will be minimized where practicable in order to limit basin size and meet the design criteria. Stormwater design for the project will be completed during final design and will minimize the impacts to the streams and wetlands located within and adjacent to the project right of way. The EA reported impacts to Federal Farmland Protection Policy Act (FPPA) soils. The entire Greenbag Road environmental study area is encompassed by "land already in or committed to urban development" as defined by the FPPA (see 7 CFR § 658.2 - Definitions) and is therefore not subject to provisions of FPPA. Please refer to the Farmland Appendix attached to the FONSI for further detail. Conscious Harvest Cooperative Community Garden, Joy and Hemp Universal LLC, and Mockingbird Hill Farms are located on private property and the property owner will be compensated for the sale of any land to the WVDOH during the right-of-way acquisition process. Impacts to this parcel have been minimized to the extent practicable. Approximately 1.56 acres (67,900 square feet) will be required from the parcel. Fair market value will be paid for all properties that require full or partial acquisition as a result of the project. When only part of the property is required, as is the case with this parcel, fair market value of the part taken will be paid, plus damages, if any, to the residue, less all benefits. West Virginia law defines "market value" as the price a willing buyer would pay a willing seller, neither acting under compulsion nor duress, both exercising prudence and intelligent judgment as to its value and familiar with the purpose for which the property is reasonably available. Fair market value will be determined by a competent, professional real estate appraiser after a thorough inspection of the property, a comparison with similar properties in the area that have been sold recently, a determination and consideration of its replacement cost and depreciation and consideration of the income-producing potential. All appraisal reports are office-reviewed, then rechecked in the field by experienced, qualified review appraisers for accuracy. Since the Division of Highways has adopted a firm price policy, the property owner will be offered the full amount of the approved appraisal. There will be no attempt to buy property at less than fair market value. This policy guarantees that all citizens of the state receive full value for the money expended for highway rights of way. Those who hold a valid property interest in the property that is acquired for the project will be compensated during the ROW acquisition phase. Adding only left turn lanes on Greenbag Road at the Dorsey/Kingwood Pike intersection was evaluated during an initial round of traffic analysis because this option had been suggested by the MPO. The option included upgrading the signal lights to have a protected/permissive left turn phase. The analysis showed that this option would result in some intersection improvements but could not achieve LOS C or better for the

	overall intersection operation. It should be noted that LOS C is WVDOH's design year level of service criteria threshold for intersection improvements. The overall intersection would operate at an unacceptable level of service (LOS E). In addition, the left turn lane option would result in the eastbound Greenbag Road traffic queue to extend past the Bluegrass Village Driveway.
812	The turn lane options that were examined do not improve the level of service as much as the roundabout and the turn lanes at Dorsey Avenue/Kingwood Pike involve complete takes of 2 residences and 1 business. This change will be noted in the FONSI. Adding only left turn lanes on Greenbag Road at the Dorsey/Kingwood Pike intersection was evaluated during an initial round of traffic analysis because this option had been suggested by the MPO. The option included upgrading the signal lights to have a protected/permissive left turn phase. The analysis showed that this option would result in some intersection improvements but could not achieve LOS C or better for the overall intersection operation. The overall intersection would operate at an unacceptable LOS (LOS E or F). The eastbound Greenbag Road traffic queue would extend past the Bluegrass Village Driveway. Based on these findings this option was replaced with Options D and E for the EA analysis. The existing grade on Kingwood Pike requires stopping on a -6.5% grade at the traffic signal. The grade approaching the roundabout includes a flat grade of less than 2% at the roundabout. In most cases, the roundabout will not require approaching traffic to come to a full or immediate stop, and does not queue traffic on the steep grade as the existing traffic signal does. Conscious Harvest Cooperative Community Garden, Joy and Hemp Universal LLC, and Mockingbird Hill Farms are located on private property and the property owner will be compensated for the sale of any land to the WVDOH during the right-of-way acquisition process. Impacts to this parcel have been minimized to the extent practicable. Approximately 1.56 acres (67,900 square feet) will be required from the parcel. The EA reported impacts to Federal Farmland Protection Policy Act (FPPA) soils. The entire Greenbag Road environmental study area is encompassed by "land already in or committed to urban development" as defined by the FPPA (see 7 CFR § 658.2 - Definitions) and is therefore not subject to provisions of FPPA. Please refer to the Farmland Appendix attached to the FONSI for further detail. Fair market value will be paid for all properties that require full or partial acquisition as a result of the project. When only part of the property is required, as is the case with this parcel, fair market value of the part taken will be paid, plus damages, if any, to the residue, less all benefits. West Virginia law defines "market value" as the price a willing buyer would pay a willing seller, neither acting under compulsion nor duress, both exercising prudence and intelligent judgment as to its value and familiar with the purpose for which the property is reasonably available. Fair market value will be determined by a competent, professional real estate appraiser after a thorough inspection of the property, a comparison with similar properties in the area that have been sold recently, a determination and consideration of its replacement cost and depreciation and consideration of the income-producing potential. All appraisal reports are office-reviewed, then rechecked in the field by experienced, qualified review appraisers for accuracy. Since the Division of Highways has adopted a firm price policy, the property owner will be offered the full

	amount of the approved appraisal. There will be no attempt to buy property at less than fair market value. This policy guarantees that all citizens of the state receive full value for the money expended for highway rights of way. Those who hold a valid property interest in the property that is acquired for the project will be compensated during the ROW acquisition phase.
813	The EA for the project identifies the intermittent and permanent stream impacts for each alternative analyzed. The stream impacts were determined for the EA based on the limit of disturbance provided and did not include culverted, relocated or stream loss lengths. The type of intermittent and permanent stream impacts identified for each alternative are similar. The total stream impacts for Option A is 500 LF and Options B and C are 521 LF. The total stream impacts for Option D is 428 LF, Option B is 433 LF and Option C is 453 LF. The level of detail to determine the type of stream impact including culverted, relocated, and stream loss, for the preferred alternative will be further analyzed in Final design. Options to further reduce impacts to the streams for the preferred alternative will need to be considered during Final Design. The analysis for water quality and quantity will also be further analyzed during Final Design. A detailed stream assessment will also be performed for the streams that will be impacted for the preferred alternative. Coordination with the DEP and the USACE will occur in final design and the applicable waterway permit will be obtained for the project. The stormwater management plan for this project will meet the volume and rate requirements of the Morgantown Utility Board and WVDOH policies. Due to the existing topography and features it is likely that these requirements will require basins and other stormwater BMP's, such as vegetated swales. The amount of offsite runoff to the streams and wetlands will be minimized where practicable in order to limit basin size and meet the design criteria. Fair market value will be paid for all properties that require full or partial acquisition as a result of the project. When only part of the property is required, as is the case with this parcel, fair market value of the part taken will be paid, plus damages, if any, to the residue, less all benefits. West Virginia law defines "market value" as the price a willing buyer would pay a willing seller, neither acting under compulsion nor duress, both exercising prudence and intelligent judgment as to its value and familiar with the purpose for which the property is reasonably available. Fair

	market value will be determined by a competent, professional real estate appraiser after a thorough inspection of the property, a comparison with similar properties in the area that have been sold recently, a determination and consideration of its replacement cost and depreciation and consideration of the income-producing potential. All appraisal reports are office-reviewed, then rechecked in the field by experienced, qualified review appraisers for accuracy. Since the Division of Highways has adopted a firm price policy, the property owner will be offered the full amount of the approved appraisal. There will be no attempt to buy property at less than fair market value. This policy guarantees that all citizens of the state receive full value for the money expended for highway rights of way. Those who hold a valid property interest in the property that is acquired for the project will be compensated during the ROW acquisition phase. More information is available in the FONSI and EA appendices. The EA and appendices are available on the WVDOH website: https://transportation.wv.gov/highways/engineering/comment/closed/greenbagroadimprovementproject/Pages/default.aspx.
814	The table on page 239 of the PDF of the EA lists the hydric soils identified in the project area as listed on the NRCS State Soil Data Access Hydric Soils List. The Clarksburg soil series (CkC and CkB) are listed as hydric in Monongalia County. The Monongahela soil series is also listed as hydric in Monongalia County. The EA identifies wetland impacts for each alternative analyzed. Wetland impacts for alternative 1 are 0.06 acres (Palustrine Emergent 0.01 acres and Palustrine Forested 0.05 acres) and 0.05 acres for Alternative 2 (Palustrine Emergent 0.01 acres and Palustrine Forested 0.04 acres). Wetland impacts were additionally calculated for each of the intersection options: Option A is 0.05 acres (Palustrine Emergent), Option B is 0.05 acres (Palustrine Emergent) and Option C is 0.05 acres (Palustrine Emergent). No wetland impacts were identified for Options D, E, and F. The stormwater management plan for this project will meet the volume and rate requirements of the Morgantown Utility Board and WVDOH policies. Due to the existing topography and features it is likely that these requirements will require basins and other stormwater BMP's, such as vegetated swales. The amount of offsite runoff to the streams and wetlands will be minimized where practicable in order to limit basin size and meet the design criteria. Stormwater design for the project will be completed during final design and will minimize the impacts to the streams and wetlands located within and adjacent to the project right of way.
815	The EA reported impacts to Federal Farmland Protection Policy Act (FPPA) soils. The entire Greenbag Road environmental study area is encompassed by "land already in or committed to urban development" as defined by the FPPA (see 7 CFR § 658.2 - Definitions) and is therefore not subject to provisions of FPPA. Please refer to the Farmland Appendix attached to the FONSI for further detail.

	Any property needed for the project will be acquired under the Uniform Relocation Assistance and Real Property Acquisition Act (1970) through negotiations with the landowners. Conscious Harvest Cooperative Community Garden, Joy and Hemp Universal LLC, and Mockingbird Hill Farms are located on private property and the property owner will be compensated for the sale of any land to the WVDOH during the right-of-way acquisition process. Impacts to this parcel have been minimized to the extent practicable. Approximately 1.56 acres (67,900 square feet) will be required from the parcel. Fair market value will be paid for all properties that require full or partial acquisition as a result of the project. When only part of the property is required, as is the case with this parcel, fair market value of the part taken will be paid, plus damages, if any, to the residue, less all benefits. West Virginia law defines "market value" as the price a willing buyer would pay a willing seller, neither acting under compulsion nor duress, both exercising prudence and intelligent judgment as to its value and familiar with the purpose for which the property is reasonably available. Fair market value will be determined by a competent, professional real estate appraiser after a thorough inspection of the property, a comparison with similar properties in the area that have been sold recently, a determination and consideration of its replacement cost and depreciation and consideration of the income-producing potential. All appraisal reports are office-reviewed, then rechecked in the field by experienced, qualified review appraisers for accuracy. Since the Division of Highways has adopted a firm price policy, the property owner will be offered the full amount of the approved appraisal. There will be no attempt to buy property at less than fair market value. This policy guarantees that all citizens of the state receive full value for the money expended for highway rights of way. Those who hold a valid property interest in the property that is acquired for the project will be compensated during the ROW acquisition phase.
816	Findings from the Environmental studies (aquatic resources such as streams and wetlands; rare, threatened and endangered species of plants and animals; floodplains; farmlands; groundwater; hazardous materials; air quality; and noise) that were conducted to evaluate impacts associated with the proposed project are documented in the EA. The aquatic resources study was conducted based on the guiding manuals for wetland and stream identification. The wetland study adhered to the USACE Corps of Engineers Wetland Delineation Manual and the Regional Supplement to the Corps of Engineers Wetland Delineation Manual: Eastern Mountains and Piedmont Region. The stream identification and classification was based on the definitions from Title 46 and the West Virginia Surface Mining Rules. The study identified and delineated 8 palustrine wetlands and 13 jurisdictional watercourses within the project study area. Any changes to aquatic resource impacts in final design will be identified and included in the mitigation plan. The EA identifies wetland impacts for each alternative analyzed. Wetland impacts for alternative 1 are 0.06 acres (Palustrine Emergent 0.01 acres and Palustrine Forested 0.05 acres) and 0.05 acres for Alternative 2 (Palustrine Emergent 0.01 acres and Palustrine Forested 0.04 acres). Wetland impacts were additionally calculated for each of the intersection options: Option A is 0.05 acres (Palustrine Emergent), Option

	B is 0.05 acres (Palustrine Emergent) and Option C is 0.05 acres (Palustrine Emergent). No wetland impacts were identified for Options D, E, and F. The EA for the project identifies the intermittent and permanent stream impacts for each alternative analyzed. The stream impacts were determined for the EA based on the limit of disturbance provided and did not include culverted, relocated or stream loss lengths. The type of intermittent and permanent stream impacts identified for each alternative are similar. The total stream impacts for Option A is 500 LF and Options B and C are 521 LF. The total stream impacts for Option D is 428 LF, Option B is 433 LF and Option C is 453 LF. The level of detail to determine the type of stream impact including culverted, relocated, and stream loss, for the preferred alternative will be further analyzed in Final design. Options to further reduce impacts to the streams for the preferred alternative will need to be considered during Final Design. The analysis for water quality and quantity will also be further analyzed during Final Design. A detailed stream assessment will also be performed for the streams that will be impacted for the preferred alternative. Coordination with the DEP and the USACE will occur in final design and the applicable waterway permit will be obtained for the project. During final design, further avoidance and/or minimization measures will be considered and/or implemented as appropriate to reduce the total impacts to streams. Specific Best Management Practices will be developed prior to construction to reduce the amount of disturbed aquatic habitat and riparian vegetation; minimize opportunities for increased sedimentation during construction; revegetate all disturbed areas to prevent accelerated erosion; designate equipment fueling and service areas away from aquatic habitats; and designate and construct all stormwater management facilities to prevent runoff. Coordination with resource agencies will continue throughout construction activities as necessary. The stormwater management plan for this project will meet the volume and rate requirements of the Morgantown Utility Board and WVDOH policies. Due to the existing topography and features it is likely that these requirements will require basins and other stormwater BMP's, such as vegetated swales. The amount of offsite runoff to the streams and wetlands will be minimized where practicable in order to limit basin size and meet the design criteria. Stormwater design for the project will be completed during final design and will minimize the impacts to the streams and wetlands located within and adjacent to the project right of way. The EA identifies wetland impacts for each alternative analyzed. Wetland impacts for alternative 1 are 0.06 acres (Palustrine Emergent 0.01 acres and Palustrine Forested 0.05 acres) and 0.05 acres for Alternative 2 (Palustrine Emergent 0.01 acres and Palustrine Forested 0.04 acres). Wetland impacts were additionally calculated for each of the intersection options: Option A is 0.05 acres (Palustrine Emergent), Option B is 0.05 acres (Palustrine Emergent) and Option C is 0.05 acres (Palustrine Emergent). No wetland impacts were identified for Options D, E, and F.

	The option proposed here was one of the options suggested by the MMMPO study (adding left turn lanes only on Greenbag Rd at the Dorsey/Kingwood Pike) and was included on the first round of traffic analysis submitted to the WVDOH in February of 2019. This scenario also included upgrading the existing 2-phase traffic signal to 3-phases to incorporate a protected/permissive left turn phase. Installation of the turn lanes and modifying the signal phasing resulted in various approach and overall intersection LOS improvements; however, LOS C or better for the overall intersection operation could not be achieved. It was projected that some movements and the overall intersection would operate at an unacceptable level of service (LOS E or F). During the PM peak hour, the overall intersection is projected to operate at an overall intersection LOS E, and the eastbound through movement is forecasted to operate at a LOS F. This option would result in the Greenbag Road and Dorsey Avenue approaches queue lengths increasing. The eastbound Greenbag Road through movement queue will continue to extend past the Bluegrass Village driveway. Based on these findings and at the direction of the WVDOH, the traffic analysis was revised using additional options, which developed into Options D and E examined for the EA. The left turn lane only on Greenbag Road was not developed further and no impacts were assessed for the EA. In Table 5 the reference to Table 2 should refer to Table 6 for the Mississippi Street intersection and Table 7 for the Dorsey Avenue intersection. The EA has only one Appendix A however the individual resource reports that are attached as appendices also have attachments which begin with Appendix A. Any reference within the EA text to Appendix A is referring to the Public Meeting Summary. All project updates that have occurred since the development and approval of the EA are documented in the FONSI.
817	Thank you for enumerating the safety concerns. The WVDOH will examine all safety concerns as part of the final design. Pedestrians should use the dedicated crosswalks when safely crossing the roundabouts, just like crossing any other intersection. At a roundabout, pedestrian crosswalks will be placed to cross each roadway leg to the roundabout, which is the same as traditional intersection crossings. The roundabout pedestrian crosswalk placement allows pedestrians to cross one direction of traffic a time at each roundabout approach because of the splitter island. Pedestrians should also use the designated crosswalk locations. The sidewalk design has been extended from the western end of the project area along Greenbag Road to the Dorsey Avenue/Kingwood Pike intersection. At the intersection the sidewalk follows Dorsey Avenue north to Luckey Lane and east on Luckey Lane to the connection with the existing sidewalk at Mountainview Elementary School. The shoulder along the north side of Greenbag Road is being designed to accommodate bicycle use by being wider (3 feet) than the standard shoulder (2 feet). Extensions beyond the scope of this project can be considered during future planning. All roadway crossings will be marked and signed as crosswalks. Roundabouts are designed to slow speeds in the approach and through the roundabout allowing drivers more response time and limiting the number of potential directions where traffic could approach. Both of these factors improve safety for all drivers including older drivers as well as

	pedestrians and cyclists. Crosswalks are included in the design for all 4 roadways entering the roundabout at Greenbag Road and Dorsey Avenue/Kingwood Pike. Roundabouts help reduce the likelihood and severity of collisions. Studies by the Federal Highway Administration (FHWA) have shown that roundabouts typically achieve reduction in overall collisions, injury collisions, fatality collisions, and pedestrian collisions. Reasons for these reductions due to the installation of a roundabout include: Low travel speeds – Drivers must slow down and yield to traffic before entering a roundabout. The reduction in speeds results in a decrease in crash severity and injury. No traffic light "to beat" – The design of a roundabout promotes a continuous circular flow of traffic. Because of this design, drivers will not have the incentive to speed up to "beat the light", like they may at a traditional intersection. One way travel – The design of a roundabout directs drivers through gently designed curves into a one-way counterclockwise circular path. This design eliminates the possibilities for T-bone and head-on collisions. In addition, a conventional 4-way intersection has 32 points of vehicle conflict due to the different maneuvers through the intersection. A roundabout has 8 points of conflict, which all occur in the same direction, reducing crash severity and likelihood of injury.
818	A shared-use path was part of some early versions of the project, but the right of way impacts along Bluegrass Village and the Kennedy Center were significant. Due to these detrimental impacts the shared use path was removed from the alternatives that were advanced to the EA. The sidewalk design has been extended from the western end of the project area along Greenbag Road to the Dorsey Avenue/Kingwood Pike intersection. At the intersection, the sidewalk follows Dorsey Avenue north to Luckey Lane and east on Luckey Lane to the connection with the existing sidewalk at Mountainview Elementary School. The shoulder along the north side of Greenbag Road is being designed to accommodate bicycle use by being wider (3 feet) than the standard shoulder (2 feet). Extensions beyond the scope of this project can be considered during future planning.
819	This comment is noted.
820	The designs for the roadway and intersection improvements have factored the topography, safety issues, constructability, and current land use to develop feasible alternatives. Minimizing impacts to the environment, community, and right-of-way were also considered when evaluating the project alternatives.

	The EA reviewed multiple alternatives including turn lanes, traffic lights, and the roundabouts, under existing and future traffic conditions. Through the analysis in the EA, the only alternative that meets the purpose and need of the project is the roundabout. The preliminary investigation and engineering traffic study was completed to evaluate the Greenbag Road corridor, evaluating the existing and potential future operation of the intersections selected for study by WVDOH. The evaluation of existing roadway conditions, including the existing roadway conditions of Kingwood Pike, was not part of the preliminary investigation and engineering traffic study. The Greenbag Road corridor has long been recognized as a challenging roadway to navigate due to geometric deficiencies, significant intersection delays during the peak hours, and increased volume of truck traffic and development within the corridor. Several studies have been previously completed through the MMMPO, evaluating various transportation plans for the Greenbag Road corridor, with the ultimate vision of transforming Greenbag Road into a safe, efficient, and attractive multimodal transportation facility. The future traffic along Greenbag Road, Mississippi Avenue, Dorsey Avenue, Kingwood Pike were projected for the future design year by assuming existing traffic distribution/patterns but with increased traffic volumes though application of a yearly traffic growth rate of 1.16% per year. It should be noted that the traffic evaluation was completed prior to the COVID-19 pandemic and its effects to traffic currently occurring.
821	The EA reported impacts to Federal Farmland Protection Policy Act (FPPA) soils. The entire Greenbag Road environmental study area is encompassed by "land already in or committed to urban development" as defined by the FPPA (see 7 CFR § 658.2 - Definitions) and is therefore not subject to provisions of FPPA. Please refer to the Farmland Appendix attached to the FONSI for further detail. Conscious Harvest Cooperative Community Garden, Joy and Hemp Universal LLC, and Mockingbird Hill Farms are located on private property and the property owner will be compensated for the sale of any land to the WVDOH during the right-of-way acquisition process. Impacts to this parcel have been minimized to the extent practicable. Approximately 1.56 acres (67,900 square feet) will be required from the parcel. Fair market value will be paid for all properties that require full or partial acquisition as a result of the project. When only part of the property is required, as is the case with this parcel, fair market value of the part taken will be paid, plus damages, if any, to the residue, less all benefits. West Virginia law defines "market value" as the price a willing buyer would pay a willing seller, neither acting under compulsion nor duress, both exercising prudence and intelligent judgment as to its value and familiar with the purpose for which the property is reasonably available. Fair market value will be determined by a competent, professional real estate appraiser after a thorough inspection of the property, a comparison with similar properties in the area that have been sold recently, a determination and consideration of its replacement cost and depreciation and consideration of the income-producing potential. All appraisal reports are office-reviewed, then rechecked in the field by experienced, qualified review appraisers for accuracy. Since the Division of Highways has adopted a firm price policy, the property owner will be offered the full amount of the approved appraisal. There will be no attempt to buy property at less than fair market value. This policy guarantees that all citizens of the state receive full value for the money expended for highway rights of way.

	Those who hold a valid property interest in the property that is acquired for the project will be compensated during the ROW acquisition phase.
822	The EA reviewed multiple alternatives including turn lanes, traffic lights, and the roundabouts. Through the analysis in the EA, the only alternative that meets the purpose and need of the project is the roundabout. The turn lane options that were examined do not improve the level of service as much as the roundabout and the turn lanes at Dorsey Avenue/Kingwood Pike involve complete takes of 2 residences and 1 business. This change will be noted in the FONSI. Adding only left turn lanes on Greenbag Road at the Dorsey/Kingwood Pike intersection was evaluated during an initial round of traffic analysis because this option had been suggested by the MPO. The option included upgrading the signal lights to have a protected/permissive left turn phase. The analysis showed that this option would result in some intersection improvements but could not achieve LOS C or better for the overall intersection operation. The overall intersection would operate at an unacceptable LOS (LOS E or F). The eastbound Greenbag Road traffic queue would extend past the Bluegrass Village Driveway. Based on these findings this option was replaced with Options D and E for the EA analysis.
823	Written comments submitted following the April 2019 public meeting were included in the final Environmental Assessment, approved by FHWA on August 28, 2020. The final design will factor the geotechnical information needed to design the retaining wall and prevent further damage. The EA reported impacts to Federal Farmland Protection Policy Act (FPPA) soils. The entire Greenbag Road environmental study area is encompassed by "land already in or committed to urban development" as defined by the FPPA (see 7 CFR § 658.2 - Definitions) and is therefore not subject to provisions of FPPA. Please refer to the Farmland Appendix attached to the FONSI for further detail. Conscious Harvest Cooperative Community Garden, Joy and Hemp Universal LLC, and Mockingbird Hill Farms are located on private property and the property owner will be compensated for the sale of any land to the WVDOH during the right-of-way acquisition process. Impacts to this parcel have been minimized to the extent practicable. Approximately 1.56 acres (67,900 square feet) will be required from the parcel. Fair market value will be paid for all properties that require full or partial acquisition as a result of the project. When only part of the property is required, as is the case with this parcel, fair market value of the part taken will be paid, plus damages, if any, to the residue, less all benefits. West Virginia law defines "market value" as the price a willing buyer would pay a willing seller, neither acting under compulsion nor duress, both exercising prudence and intelligent judgment as to its value and familiar with the purpose for which the property is reasonably available. Fair market value will be determined by a competent, professional real estate appraiser after a thorough inspection of the property, a comparison with similar properties in the area that have been sold recently, a determination and consideration of its replacement cost and depreciation and consideration of the income-producing potential. All appraisal reports are office-reviewed, then rechecked in the field by experienced, qualified review appraisers for accuracy. Since the Division of Highways has adopted a firm price policy, the property owner will be offered the full

	amount of the approved appraisal. There will be no attempt to buy property at less than fair market value. This policy guarantees that all citizens of the state receive full value for the money expended for highway rights of way. Those who hold a valid property interest in the property that is acquired for the project will be compensated during the ROW acquisition phase.
824	The sidewalk design has been extended from the western end of the project area along Greenbag Road to the Dorsey Avenue/Kingwood Pike intersection. At the intersection the sidewalk follows Dorsey Avenue north to Luckey Lane and east on Luckey Lane to the connection with the existing sidewalk at Mountainview Elementary School. The shoulder along the north side of Greenbag Road is being designed to accommodate bicycle use by being wider (3 feet) than the standard shoulder (2 feet). Extensions beyond the scope of this project can be considered during future planning. The WVDOH will examine all safety and active transportation accommodation concerns as part of the final design. Pedestrians should use the dedicated crosswalks when safely crossing the roundabouts, just like crossing any other intersection. At a roundabout, pedestrian crosswalks will be placed to cross each roadway leg to the roundabout, which is the same as traditional intersection crossings. The roundabout pedestrian crosswalk placement allows pedestrians to cross one direction of traffic a time at each roundabout approach because of the splitter island. Pedestrians should also use the designated crosswalk locations. Roundabouts help reduce the likelihood and severity of collisions. Studies by the Federal Highway Administration (FHWA) have shown that roundabouts typically achieve reduction in overall collisions, injury collisions, fatality collisions, and pedestrian collisions. Reasons for these reductions due to the installation of a roundabout include: Low travel speeds – Drivers must slow down and yield to traffic before entering a roundabout. The reduction in speeds results in a decrease in crash severity and injury. No traffic light “to beat” – The design of a roundabout promotes a continuous circular flow of traffic. Because of this design, drivers will not have the incentive to speed up to “beat the light”, like they may at a traditional intersection. One way travel – The design of a roundabout directs drivers through gently designed curves into a one-way counterclockwise circular path. This design eliminates the possibilities for T-bone and head-on collisions. In addition, a conventional 4-way intersection has 32 points of vehicle conflict due to the different maneuvers through the intersection. A roundabout has 8 points of conflict, which all occur in the same direction, reducing crash severity and likelihood of injury.

825	The EA analysis included evaluation of potential impacts to numerous categories including natural resources, cultural resources, land use, indirect, and cumulative effects. The Secondary and Cumulative Impacts analysis was included as an appendix to the EA and describes area growth and development trends that are projected to occur whether or not the proposed roadway improvements are constructed. The proposed project will redesign Greenbag Road to operate at an acceptable level of service as these current growth and development trends continue. The proposed project includes improvements to an existing transportation facility and the construction of the project is not expected to stimulate secondary growth, affect land use decisions, or induce land use change. Environmental impacts associated with current and projected growth and development are outside the scope of this project. Findings from the Environmental studies (aquatic resources such as streams and wetlands; rare, threatened and endangered species of plants and animals; floodplains; farmlands; groundwater; hazardous materials; air quality; and noise) that were conducted to evaluate impacts associated with the proposed project are documented in the EA. The noise analysis report indicates the Greenbag Road and intersection improvements for this alternative do not meet the requirements for either a Type I or Type II project. The Project is classified as a Type III project and a detailed noise analysis for highway traffic noise impacts was not required. The Type III noise analysis is available as an Appendix to the EA on the WVDOH website at https://transportation.wv.gov/highways/engineering/comment/closed/greenbagroadimprovementproject/Pages/default.aspx. Roundabouts are designed to maintain a constant flow of traffic through the intersection which results in reduced congestion on roadways and a reduction in delays for drivers. Studies have shown that changing signalized intersections to roundabouts can have up to an 89% average reduction in vehicle delays. The improved traffic flow also results in reduced vehicle emissions including carbon monoxide, nitrous oxide, and carbon dioxide at the intersection. Additionally, roundabouts are designed to slow speeds in the approach and through the roundabout allowing drivers more response time and limiting the number of potential directions where traffic could approach.
826	The sidewalk design has been extended from the western end of the project area along Greenbag Road to the Dorsey Avenue/Kingwood Pike intersection. At the intersection the sidewalk follows Dorsey Avenue north to Luckey Lane and east on Luckey Lane to the connection with the existing sidewalk at Mountainview Elementary School. The shoulder along the north side of Greenbag Road is being designed to accommodate bicycle use by being wider (3 feet) than the standard shoulder (2 feet). Extensions beyond the scope of this project can be considered during future planning. The WVDOH will examine all safety and active transportation accommodation concerns as part of the final design. Pedestrians should use the dedicated crosswalks when safely crossing the roundabouts, just like crossing any other intersection. At a roundabout, pedestrian crosswalks will be placed to cross each roadway leg to the roundabout, which is the same as traditional intersection

	crossings. The roundabout pedestrian crosswalk placement allows pedestrians to cross one direction of traffic a time at each roundabout approach because of the splitter island. Pedestrians should also use the designated crosswalk locations. Roundabouts help reduce the likelihood and severity of collisions. Studies by the Federal Highway Administration (FHWA) have shown that roundabouts typically achieve reduction in overall collisions, injury collisions, fatality collisions, and pedestrian collisions. Reasons for these reductions due to the installation of a roundabout include: Low travel speeds – Drivers must slow down and yield to traffic before entering a roundabout. The reduction in speeds results in a decrease in crash severity and injury. No traffic light "to beat" – The design of a roundabout promotes a continuous circular flow of traffic. Because of this design, drivers will not have the incentive to speed up to "beat the light", like they may at a traditional intersection. One way travel – The design of a roundabout directs drivers through gently designed curves into a one-way counterclockwise circular path. This design eliminates the possibilities for T-bone and head-on collisions. In addition, a conventional 4-way intersection has 32 points of vehicle conflict due to the different maneuvers through the intersection. A roundabout has 8 points of conflict, which all occur in the same direction, reducing crash severity and likelihood of injury.
827	The sidewalk design has been extended from the western end of the project area along Greenbag Road to the Dorsey Avenue/Kingwood Pike intersection. At the intersection the sidewalk follows Dorsey Avenue north to Luckey Lane and east on Luckey Lane to the connection with the existing sidewalk at Mountainview Elementary School. The shoulder along the north side of Greenbag Road is being designed to accommodate bicycle use by being wider (3 feet) than the standard shoulder (2 feet). Extensions beyond the scope of this project can be considered during future planning. The WVDOH will examine all safety and active transportation accommodation concerns as part of the final design. Pedestrians should use the dedicated crosswalks when safely crossing the roundabouts, just like crossing any other intersection. At a roundabout, pedestrian crosswalks will be placed to cross each roadway leg to the roundabout, which is the same as traditional intersection crossings. The roundabout pedestrian crosswalk placement allows pedestrians to cross one direction of traffic a time at each roundabout approach because of the splitter island. Pedestrians should also use the designated crosswalk locations.

	Roundabouts help reduce the likelihood and severity of collisions. Studies by the Federal Highway Administration (FHWA) have shown that roundabouts typically achieve reduction in overall collisions, injury collisions, fatality collisions, and pedestrian collisions. Reasons for these reductions due to the installation of a roundabout include: Low travel speeds – Drivers must slow down and yield to traffic before entering a roundabout. The reduction in speeds results in a decrease in crash severity and injury. No traffic light "to beat" – The design of a roundabout promotes a continuous circular flow of traffic. Because of this design, drivers will not have the incentive to speed up to "beat the light", like they may at a traditional intersection. One way travel – The design of a roundabout directs drivers through gently designed curves into a one-way counterclockwise circular path. This design eliminates the possibilities for T-bone and head-on collisions. In addition, a conventional 4-way intersection has 32 points of vehicle conflict due to the different maneuvers through the intersection. A roundabout has 8 points of conflict, which all occur in the same direction, reducing crash severity and likelihood of injury.
828	The traffic control plan will continue to be revised during final design, and will not use Aaron's Creek Road as a signed detour. The revised plan intends to utilize the center of the Dorsey/Kingwood roundabout as a temporary intersection with temporary traffic signals. A short-term detour is proposed using Summers School Road while constructing the connection of the existing Kingwood Pike with the new portion. Road repair beyond the scope of this project is being addressed through the Governor's Roads to Prosperity program and progress can be tracked via the WVDOH website.
829	Drainage issues within the project footprint will be addressed by the project design.
830	The safe mobility and needs of all users of the Greenbag Road corridor and other facilities within the project area were considered and incorporated in the proposed improvements through project development. Please refer to the EA and appendices for more information (https://transportation.wv.gov/highways/engineering/comment/closed/greenbagroadimprovementproject/Pages/default.aspx).
831	The diversion of traffic from downtown, including large trucks, is not within the scope of this project. The preliminary investigation and engineering traffic study has examined two build alternatives and three options for each of the major intersections. The intersection options that were evaluated and analyzed include turning lanes, traffic signals, and roundabouts. WVDOH requires intersection improvements to meet or exceed an overall intersection LOS C or better during the peak hours studied for design year

	improvements. The times of day (peak hours) selected to be studied followed WVDOH guidelines and is standard traffic engineering practice for determining future intersection improvements. At the intersection of Greenbag Road/Dorsey Avenue/Kingwood Pike the traffic analysis determined that the intersection would operate at failure (overall intersection LOS F) if existing intersection conditions and operations were to remain the same 30-years in the future (design year) without any improvements. Adding only left turn lanes on Greenbag Road at the Dorsey/Kingwood Pike intersection was evaluated during an initial round of traffic analysis because this option had been suggested by the MPO. The option included upgrading the signal lights to have a protected/permissive left turn phase. The analysis showed that this option would result in some intersection improvements but could not achieve LOS C or better for the overall intersection operation. The overall intersection would operate at an unacceptable LOS (LOS E). In addition, the left turn lane option would result in the eastbound Greenbag Road traffic queue to extend past the Bluegrass Village Driveway. The traffic analysis determined that with installation of a roundabout the overall intersection would operate at a LOS C, meeting WVDOH design year criteria. At the intersection of Greenbag Road/Mississippi Avenue the traffic analysis determined that the intersection would operate at failure (overall intersection LOS F) if existing intersection conditions and operations were to remain the same 30-years in the future (design year) without any improvements. The design year with improvements scenarios evaluated determined that with installation of a roundabout the overall intersection would operate at a LOS A, best operating conditions, for all peak hours studied. Installation of a traffic signal with turn lanes resulted in an overall intersection LOS B during the AM peak hour, with the Mississippi Avenue approach operating at a LOS C. Though the analysis meets WVDOH minimum LOS criteria, the roundabout option exceeds WVDOH minimum LOS criteria. Roundabouts help reduce vehicular delay and promotes a continuous flow of traffic, which increases traffic capacity at an intersection. The roundabouts have been designed with larger vehicles in mind and incorporate truck aprons to support the weight and turning radius of larger vehicles, including school buses. In addition, roundabouts help reduce the likelihood and severity of collisions. Studies by the Federal Highway Administration (FHWA) have shown that roundabouts typically achieve reduction in overall collisions, injury collisions, fatality collisions, and pedestrian collisions. Reasons for these reductions due to the installation of a roundabout include: - Low travel speeds – Drivers must slow down and yield to traffic before entering a roundabout. The reduction in speeds results in a decrease in crash severity and injury. - No traffic light “to beat” – The design of a roundabout promotes a continuous circular flow of traffic. Because of this design, drivers will not have the incentive to speed up to “beat the light”, like they may at a traditional intersection. - One way travel – The design of a roundabout directs drivers through gently designed curves into a one-way counterclockwise circular path. This design eliminates the possibilities for T-bone and head-on collisions.

	In addition, a conventional 4-way intersection has 32 points of vehicle conflict due to the different crossings and maneuvers through the intersection. A roundabout has 8 points of conflict, which all occur in the same direction, reducing crash severity and likelihood of injury. The WVDOH has an educational video on how to use a roundabout available for viewing at https://www.youtube.com/watch?v=7njH4MKyo0w. Road repair beyond the scope of this project is being addressed through the Governor's Roads to Prosperity program and progress can be tracked via the WVDOH website. Conscious Harvest Cooperative Community Garden, Joy and Hemp Universal LLC, and Mockingbird Hill Farms are located on private property and the property owner will be compensated for the sale of any land to the WVDOH during the right-of-way acquisition process. Impacts to this parcel have been minimized to the extent practicable. Approximately 1.56 acres (67,900 square feet) will be required from the parcel. Fair market value will be paid for all properties that require full or partial acquisition as a result of the project. When only part of the property is required, as is the case with this parcel, fair market value of the part taken will be paid, plus damages, if any, to the residue, less all benefits. West Virginia law defines “market value” as the price a willing buyer would pay a willing seller, neither acting under compulsion nor duress, both exercising prudence and intelligent judgment as to its value and familiar with the purpose for which the property is reasonably available. Fair market value will be determined by a competent, professional real estate appraiser after a thorough inspection of the property, a comparison with similar properties in the area that have been sold recently, a determination and consideration of its replacement cost and depreciation and consideration of the income-producing potential. All appraisal reports are office-reviewed, then rechecked in the field by experienced, qualified review appraisers for accuracy. Since the Division of Highways has adopted a firm price policy, the property owner will be offered the full amount of the approved appraisal. There will be no attempt to buy property at less than fair market value. This policy guarantees that all citizens of the state receive full value for the money expended for highway rights of way. Those who hold a valid property interest in the property that is acquired for the project will be compensated during the ROW acquisition phase.
832	A shared-use path was part of some early versions of the project, but the right of way impacts along Bluegrass Village and the Kennedy Center were significant. Due to these detrimental impacts the shared use path was removed from the alternatives that were advanced to the EA. The sidewalk design has been extended from the western end of the project area along Greenbag Road to the Dorsey Avenue/Kingwood Pike intersection. At the intersection the sidewalk follows Dorsey Avenue north to Luckey Lane and east on Luckey Lane to the connection with the existing sidewalk at Mountainview Elementary School. The shoulder along the north side of Greenbag Road is being designed to accommodate bicycle use by being wider (3 feet) than the standard shoulder (2 feet). Extensions beyond the scope of this project can be considered during future planning. Thank you for enumerating the safety concerns and the proposed HAWK beacon crosswalk.

	Pedestrians should use the dedicated crosswalks when safely crossing the roundabouts, just like crossing any other intersection. At a roundabout, pedestrian crosswalks will be placed to cross each roadway leg to the roundabout, which is the same as traditional intersection crossings. The roundabout pedestrian crosswalk placement allows pedestrians to cross one direction of traffic a time at each roundabout approach because of the splitter island. Pedestrians should also use the designated crosswalk locations. Roundabouts help reduce the likelihood and severity of collisions. Studies by the Federal Highway Administration (FHWA) have shown that roundabouts typically achieve reduction in overall collisions, injury collisions, fatality collisions, and pedestrian collisions. Reasons for these reductions due to the installation of a roundabout include: Low travel speeds – Drivers must slow down and yield to traffic before entering a roundabout. The reduction in speeds results in a decrease in crash severity and injury. No traffic light "to beat" – The design of a roundabout promotes a continuous circular flow of traffic. Because of this design, drivers will not have the incentive to speed up to "beat the light", like they may at a traditional intersection. One way travel – The design of a roundabout directs drivers through gently designed curves into a one-way counterclockwise circular path. This design eliminates the possibilities for T-bone and head-on collisions. In addition, a conventional 4-way intersection has 32 points of vehicle conflict due to the different maneuvers through the intersection. A roundabout has 8 points of conflict, which all occur in the same direction, reducing crash severity and likelihood of injury.
833	One of the major differences between Greenbag Road and the Mileground, is the volume of traffic. Greenbag Road has less than half the traffic volume that Mileground has. A second major difference is the general configuration of the roundabouts. The proposed roundabouts on Greenbag are more straightforward and more traditional roundabout designs, without all of the confusing lanes that are present at Mileground. The roundabouts on Greenbag Road will be more intuitive for drivers. Every roundabout is designed and adapted to the context of its location.
834	The option proposed here was one of the options suggested by the MMMPO study (adding left turn lanes only on Greenbag Rd at the Dorsey/Kingwood Pike) and was included on the first round of traffic analysis submitted to the WVDOH in February of 2019. This scenario also included upgrading the existing 2-phase traffic signal to 3-phases to incorporate a protected/permissive left turn phase. Installation of the turn lanes and modifying the signal phasing resulted in various approach and overall intersection LOS improvements; however, LOS C or better for the overall intersection operation could not be achieved. It was projected that some movements and the overall intersection would operate at an unacceptable level of service (LOS E or F). During the PM peak hour, the overall intersection is projected to operate at an overall intersection LOS E, and the eastbound through movement is forecasted to operate at a LOS F. This option would result in the Greenbag Road and Dorsey Avenue approaches queue lengths increasing. The eastbound Greenbag Road through movement queue will continue to extend past the

	Bluegrass Village driveway. Based on these findings and at the direction of the WVDOH, the traffic analysis was revised using additional options, which developed into Options D and E examined for the EA. The left turn lane only on Greenbag Road was not developed further and no impacts were assessed for the EA. During final design, further avoidance and/or minimization measures will be considered and/or implemented as appropriate to reduce the total impacts to streams. Specific Best Management Practices will be developed prior to construction to reduce the amount of disturbed aquatic habitat and riparian vegetation; minimize opportunities for increased sedimentation during construction; revegetate all disturbed areas to prevent accelerated erosion; designate equipment fueling and service areas away from aquatic habitats; and designate and construct all stormwater management facilities to prevent runoff. Coordination with resource agencies will continue throughout construction activities as necessary. The stormwater management plan for this project will meet the volume and rate requirements of the Morgantown Utility Board and WVDOH policies. Due to the existing topography and features it is likely that these requirements will require basins and other stormwater BMP's, such as vegetated swales. The amount of offsite runoff to the streams and wetlands will be minimized where practicable in order to limit basin size and meet the design criteria. Stormwater design for the project will be completed during final design and will minimize the impacts to the streams and wetlands located within and adjacent to the project right of way. The EA reported impacts to Federal Farmland Protection Policy Act (FPPA) soils. The entire Greenbag Road environmental study area is encompassed by "land already in or committed to urban development" as defined by the FPPA (see 7 CFR § 658.2 - Definitions) and is therefore not subject to provisions of FPPA. Please refer to the Farmland Appendix attached to the FONSI for further detail. Conscious Harvest Cooperative Community Garden, Joy and Hemp Universal LLC, and Mockingbird Hill Farms are located on private property and the property owner will be compensated for the sale of any land to the WVDOH during the right-of-way acquisition process. Impacts to this parcel have been minimized to the extent practicable. Approximately 1.56 acres (67,900 square feet) will be required from the parcel. Fair market value will be paid for all properties that require full or partial acquisition as a result of the project. When only part of the property is required, as is the case with this parcel, fair market value of the part taken will be paid, plus damages, if any, to the residue, less all benefits. West Virginia law defines "market value" as the price a willing buyer would pay a willing seller, neither acting under compulsion nor duress, both exercising prudence and intelligent judgment as to its value and familiar with the purpose for which the property is reasonably available. Fair market value will be determined by a competent, professional real estate appraiser after a thorough inspection of the property, a comparison with similar properties in the area that have been sold recently, a determination and consideration of its replacement cost and depreciation and consideration of the income-producing potential. All appraisal reports are office-reviewed, then rechecked in the field by experienced, qualified review appraisers for accuracy. Since the Division of Highways has adopted a firm price policy, the property owner will be offered the full

	amount of the approved appraisal. There will be no attempt to buy property at less than fair market value. This policy guarantees that all citizens of the state receive full value for the money expended for highway rights of way. Those who hold a valid property interest in the property that is acquired for the project will be compensated during the ROW acquisition phase. The cultural resources surveys were conducted according to the guidelines published by the WV State Historic Preservation Office. The archaeological survey included the excavation of 213 shovel test pits, one test excavation unit, and visual inspection of the entire surface area within the defined area of potential effect. Based on the SHPO guidelines, when no cultural resources are identified during the Phase I survey, an abbreviated technical report is acceptable. As the reviewing agency, the WV SHPO concurred with the recommendation that no further archaeological investigations were warranted and no archaeological historic properties are present in the study area. The historic structures survey resulted in the identification of 25 structures 45+ years old within the defined area of potential effect. Two of the resources were recommended eligible for the National Register of Historic Places and the project was designed to avoid potential impacts to these properties. As the reviewing agency, the WV SHPO concurred with the recommendation that the project would not adversely affect any NRHP eligible resources and that no further historic structures investigations were needed. The cultural resources reports are available as an Appendix to the EA on the WVDOH website at https://transportation.wv.gov/highways/engineering/comment/closed/greenbagroadimprovementproject/Pages/default.aspx. In regards to cost, since the traffic analysis determined that left turn lanes on Greenbag Road did not meet WVDOH's LOS criteria, a cost estimate was not prepared. However, long-term costs associated with roundabouts are significantly less than a traffic signal, since no electrical costs and no traffic signal maintenance are involved with a roundabout.
835	The option proposed here was one of the options suggested by the MMMPO study (adding left turn lanes only on Greenbag Rd at the Dorsey/Kingwood Pike) and was included on the first round of traffic analysis submitted to the WVDOH in February of 2019. This scenario also included upgrading the existing 2-phase traffic signal to 3-phases to incorporate a protected/permissive left turn phase. Installation of the turn lanes and modifying the signal phasing resulted in various approach and overall intersection LOS improvements; however, LOS C or better for the overall intersection operation could not be achieved. It was projected that some movements and the overall intersection would operate at an unacceptable level of service (LOS E or F). During the PM peak hour, the overall intersection is projected to operate at an overall intersection LOS E, and the eastbound through movement is forecasted to operate at a LOS F. This option would result in the Greenbag Road and Dorsey Avenue approaches queue lengths increasing. The eastbound Greenbag Road through movement queue will continue to extend past the Bluegrass Village driveway. Based on these findings and at the direction of the WVDOH, the traffic analysis was revised using additional options, which developed into Options D and E examined for the EA. The left turn lane only on Greenbag Road was not developed further and no impacts were assessed for the EA.

	During final design, further avoidance and/or minimization measures will be considered and/or implemented as appropriate to reduce the total impacts to streams. Specific Best Management Practices will be developed prior to construction to reduce the amount of disturbed aquatic habitat and riparian vegetation; minimize opportunities for increased sedimentation during construction; revegetate all disturbed areas to prevent accelerated erosion; designate equipment fueling and service areas away from aquatic habitats; and designate and construct all stormwater management facilities to prevent runoff. Fair market value will be determined by a competent, professional real estate appraiser after a thorough inspection of the property, a comparison with similar properties in the area that have been sold recently, a determination and consideration of its replacement cost and depreciation and consideration of the income-producing potential. All appraisal reports are office-reviewed, then rechecked in the field by experienced, qualified

	review appraisers for accuracy. Since the Division of Highways has adopted a firm price policy, the property owner will be offered the full amount of the approved appraisal. There will be no attempt to buy property at less than fair market value. This policy guarantees that all citizens of the state receive full value for the money expended for highway rights of way. Those who hold a valid property interest in the property that is acquired for the project will be compensated during the ROW acquisition phase. The proposed project includes improvements to an existing transportation facility and the construction of the project is not expected to stimulate secondary growth, affect land use decisions, or induce land use change. Therefore, the project is not expected to result in light pollution impacts that are significantly worse than conditions currently present within the project area. The lighting layout for the roundabout will be developed during final design. The lighting will be designed to attempt to minimize light pollution while maintaining FHWA and WVDOH standards and requirements for lighting of the roundabout.
837	The EA reported impacts to Federal Farmland Protection Policy Act (FPPA) soils. The entire Greenbag Road environmental study area is encompassed by "land already in or committed to urban development" as defined by the FPPA (see 7 CFR § 658.2 - Definitions) and is therefore not subject to provisions of FPPA. Please refer to the Farmland Appendix attached to the FONSI for further detail. Conscious Harvest Cooperative Community Garden, Joy and Hemp Universal LLC, and Mockingbird Hill Farms are located on private property and the property owner will be compensated for the sale of any land to the WVDOH during the right-of-way acquisition process. 	The proposed project includes improvements to an existing transportation facility and the construction of the project is not expected to stimulate secondary growth, affect land use decisions, or induce land use change. Therefore, the project is not expected to result in light pollution impacts that are significantly worse than conditions currently present within the project area. The lighting layout for the roundabout will be developed during final design. The lighting will be designed to attempt to minimize light pollution while maintaining FHWA and WVDOH standards and requirements for lighting of the roundabout.
838	The preliminary investigation and engineering traffic study has examined two build alternatives and three options for each of the major intersections. The intersection options that were evaluated and analyzed include turning lanes, traffic signals, and roundabouts. WVDOH requires intersection improvements to meet or exceed an overall intersection LOS C or better during the peak hours studied for design year improvements. The times of day (peak hours) selected to be studied followed WVDOH guidelines and is standard traffic engineering practice for determining future intersection improvements. At the intersection of Greenbag Road/Dorsey Avenue/Kingwood Pike the traffic analysis determined that the intersection would operate at failure (overall intersection LOS F) if existing intersection conditions and operations were to remain the same 30-years in the future (design year) without any improvements. Adding only left turn lanes on Greenbag Road at the Dorsey/Kingwood Pike intersection was evaluated during an initial round of traffic analysis because this option had been suggested by the MPO. The option included upgrading the signal lights to have a protected/permissive left turn phase. The analysis showed that this option would result in some intersection improvements but could not achieve LOS C or better for the overall intersection operation. The overall intersection would operate at an unacceptable LOS (LOS E). In addition, the left turn lane option would result in the eastbound Greenbag Road traffic queue to extend past the Bluegrass Village Driveway. The traffic analysis determined that with installation of a roundabout the overall intersection would operate at a LOS C, meeting WVDOH design year criteria. At the intersection of Greenbag Road/Mississippi Avenue the traffic analysis determined that the intersection would operate at failure (overall intersection LOS F) if existing intersection conditions and operations were to remain the same 30-years in the future (design year) without any improvements. The design year with improvements scenarios evaluated determined that with installation of a roundabout the overall intersection would operate at a LOS A, best operating conditions, for all peak hours studied. Installation of a traffic signal with turn lanes resulted in an overall intersection LOS B during the AM peak hour, with the Mississippi Avenue approach operating at a LOS C. Though the analysis meets WVDOH minimum LOS criteria, the roundabout option exceeds WVDOH minimum LOS criteria. Roundabouts help reduce vehicular delay and promotes a continuous flow of traffic, which increases traffic capacity at an intersection. Road repair beyond the scope of this project is being addressed through the Governor's Roads to Prosperity program and progress can be tracked via the WVDOH website.

839	A shared-use path was part of some early versions of the project, but the right of way impacts along Bluegrass Village and the Kennedy Center were significant. Due to these detrimental impacts the shared use path was removed from the alternatives that were advanced to the EA. The sidewalk design has been extended from the western end of the project area along Greenbag Road to the Dorsey Avenue/Kingwood Pike intersection. At the intersection the sidewalk follows Dorsey Avenue north to Luckey Lane and east on Luckey Lane to the connection with the existing sidewalk at Mountainview Elementary School. The shoulder along the north side of Greenbag Road is being designed to accommodate bicycle use by being wider (3 feet) than the standard shoulder (2 feet). Extensions beyond the scope of this project can be considered during future planning. Thank you for enumerating the safety concerns and the proposed HAWK beacon. The WVDOH will examine all safety concerns as part of the final design. The EA reported impacts to Federal Farmland Protection Policy Act (FPPA) soils. The entire Greenbag Road environmental study area is encompassed by "land already in or committed to urban development" as defined by the FPPA (see 7 CFR § 658.2 - Definitions) and is therefore not subject to provisions of FPPA. Please refer to the Farmland Appendix attached to the FONSI for further detail. Conscious Harvest Cooperative Community Garden, Joy and Hemp Universal LLC, and Mockingbird Hill Farms are located on private property and the property owner will be compensated for the sale of any land to the WVDOH during the right-of-way acquisition process. Impacts to this parcel have been minimized to the extent practicable. Approximately 1.56 acres (67,900 square feet) will be required from the parcel. Fair market value will be paid for all properties that require full or partial acquisition as a result of the project. When only part of the property is required, as is the case with this parcel, fair market value of the part taken will be paid, plus damages, if any, to the residue, less all benefits. West Virginia law defines "market value" as the price a willing buyer would pay a willing seller, neither acting under compulsion nor duress, both exercising prudence and intelligent judgment as to its value and familiar with the purpose for which the property is reasonably available. Fair market value will be determined by a competent, professional real estate appraiser after a thorough inspection of the property, a comparison with similar properties in the area that have been sold recently, a determination and consideration of its replacement cost and depreciation and consideration of the income-producing potential. All appraisal reports are office-reviewed, then rechecked in the field by experienced, qualified review appraisers for accuracy. Since the Division of Highways has adopted a firm price policy, the property owner will be offered the full amount of the approved appraisal. There will be no attempt to buy property at less than fair market value. This policy guarantees that all citizens of the state receive full value for the money expended for highway rights of way. Those who hold a valid property interest in the property that is acquired for the project will be compensated during the ROW acquisition phase. Findings from the Environmental studies (aquatic resources such as streams and wetlands; rare, threatened and endangered species of plants and animals; floodplains; farmlands; groundwater; hazardous materials; air quality; and noise) that were conducted to evaluate impacts associated with the proposed project are documented in the EA. The aquatic resources study was conducted based on the guiding manuals for

	wetland and stream identification. The wetland study adhered to the USACE Corps of Engineers Wetland Delineation Manual and the Regional Supplement to the Corps of Engineers Wetland Delineation Manual: Eastern Mountains and Piedmont Region. The stream identification and classification was based on the definitions from Title 46 and the West Virginia Surface Mining Rules. The study identified and delineated 8 palustrine wetlands and 13 jurisdictional watercourses within the project study area. Any changes to aquatic resource impacts in final design will be identified and included in the mitigation plan. The EA identifies wetland impacts for each alternative analyzed. Wetland impacts for alternative 1 are 0.06 acres (Palustrine Emergent 0.01 acres and Palustrine Forested 0.05 acres) and 0.05 acres for Alternative 2 (Palustrine Emergent 0.01 acres and Palustrine Forested 0.04 acres). Wetland impacts were additionally calculated for each of the intersection options: Option A is 0.05 acres (Palustrine Emergent), Option B is 0.05 acres (Palustrine Emergent) and Option C is 0.05 acres (Palustrine Emergent). No wetland impacts were identified for Options D, E, and F. The EA for the project identifies the intermittent and permanent stream impacts for each alternative analyzed. The stream impacts were determined for the EA based on the limit of disturbance provided and did not include culverted, relocated or stream loss lengths. The type of intermittent and permanent stream impacts identified for each alternative are similar. The total stream impacts for Option A is 500 LF and Options B and C are 521 LF. The total stream impacts for Option D is 428 LF, Option B is 433 LF and Option C is 453 LF. The level of detail to determine the type of stream impact including culverted, relocated, and stream loss, for the preferred alternative will be further analyzed in Final design. Options to further reduce impacts to the streams for the preferred alternative will need to be considered during Final Design. The analysis for water quality and quantity will also be further analyzed during Final Design. A detailed stream assessment will also be performed for the streams that will be impacted for the preferred alternative. Coordination with the DEP and the USACE will occur in final design and the applicable waterway permit will be obtained for the project. During final design, further avoidance and/or minimization measures will be considered and/or implemented as appropriate to reduce the total impacts to streams. Specific Best Management Practices will be developed prior to construction to reduce the amount of disturbed aquatic habitat and riparian vegetation; minimize opportunities for increased sedimentation during construction; revegetate all disturbed areas to prevent accelerated erosion; designate equipment fueling and service areas away from aquatic habitats; and designate and construct all stormwater management facilities to prevent runoff. Coordination with resource agencies will continue throughout construction activities as necessary. The stormwater management plan for this project will meet the volume and rate requirements of the Morgantown Utility Board and WVDOH policies. Due to the existing topography and features it is likely that these requirements will require basins and other stormwater BMP's, such as vegetated swales. The amount of offsite runoff to the streams and wetlands will be minimized where practicable in order to limit basin size and

	meet the design criteria. Stormwater design for the project will be completed during final design and will minimize the impacts to the streams and wetlands located within and adjacent to the project right of way.
840	Both the MMMPO corridor study and the 2018 traffic study determined that traffic flow through the corridor is controlled by the congestion at the major intersections in the corridor. The projected growth in the Morgantown area will continue to increase traffic and congestion at the intersections if improvements do not occur. The turn lane options that were examined do not improve the level of service as much as the roundabout. The preliminary investigation and engineering traffic study was completed to evaluate the Greenbag Road corridor, evaluating the existing and potential future operation of the intersections selected for study by WVDOH. The evaluation of existing roadway conditions, including the existing roadway conditions of Kingwood Pike, was not part of the preliminary investigation and engineering traffic study. The Greenbag Road corridor has long been recognized as a challenging roadway to navigate due to geometric deficiencies, significant intersection delays during the peak hours, and increased volume of truck traffic and development within the corridor. Several studies have been previously completed through the MMMPO, evaluating various transportation plans for the Greenbag Road corridor, with the ultimate vision of transforming Greenbag Road into a safe, efficient, and attractive multimodal transportation facility. The future traffic along Greenbag Road, Mississippi Avenue, Dorsey Avenue, Kingwood Pike were projected for the future design year by assuming existing traffic distribution/patterns but with increased traffic volumes though application of a yearly traffic growth rate of 1.16% per year. It should be noted that the traffic evaluation was completed prior to the COVID-19 pandemic and its effects to traffic currently occurring. During final design, further avoidance and/or minimization measures will be considered and/or implemented as appropriate to reduce the total impacts to jurisdictional waterways. Specific Best Management Practices will be developed prior to construction to reduce the amount of disturbed aquatic habitat and riparian vegetation; minimize opportunities for increased sedimentation during construction; revegetate all disturbed areas to prevent accelerated erosion; designate equipment fueling and service areas away from aquatic habitats; and designate and construct all stormwater management facilities to prevent runoff. Coordination with resource agencies will continue throughout construction activities as necessary. The stormwater management plan for this project will meet the volume and rate requirements of the Morgantown Utility Board and WVDOH policies. Due to the existing topography and features it is likely that these requirements will require basins and other stormwater BMP's, such as vegetated swales. The amount of offsite runoff to the streams and wetlands will be minimized where practicable in order to limit basin size and meet the design criteria. Stormwater design for the project will be completed during final design and will minimize the impacts to the streams and wetlands located within and adjacent to the project right of way.

841	A shared-use path was part of some early versions of the project, but the right of way impacts along Bluegrass Village and the Kennedy Center were significant. Due to these detrimental impacts the shared use path was removed from the alternatives that were advanced to the EA. The sidewalk design has been extended from the western end of the project area along Greenbag Road to the Dorsey Avenue/Kingwood Pike intersection. At the intersection the sidewalk follows Dorsey Avenue north to Luckey Lane and east on Luckey Lane to the connection with the existing sidewalk at Mountainview Elementary School. The shoulder along the north side of Greenbag Road is being designed to accommodate bicycle use by being wider (3 feet) than the standard shoulder (2 feet). Extensions beyond the scope of this project can be considered during future planning. Pedestrians should use the dedicated crosswalks when safely crossing the roundabouts, just like crossing any other intersection. At a roundabout, pedestrian crosswalks will be placed to cross each roadway leg to the roundabout, which is the same as traditional intersection crossings. The roundabout pedestrian crosswalk placement allows pedestrians to cross one direction of traffic a time at each roundabout approach because of the splitter island. Pedestrians should also use the designated crosswalk locations. Roundabouts help reduce the likelihood and severity of collisions. Studies by the Federal Highway Administration (FHWA) have shown that roundabouts typically achieve reduction in overall collisions, injury collisions, fatality collisions, and pedestrian collisions. Reasons for these reductions due to the installation of a roundabout include: Low travel speeds – Drivers must slow down and yield to traffic before entering a roundabout. The reduction in speeds results in a decrease in crash severity and injury. No traffic light “to beat” – The design of a roundabout promotes a continuous circular flow of traffic. Because of this design, drivers will not have the incentive to speed up to “beat the light”, like they may at a traditional intersection. One way travel – The design of a roundabout directs drivers through gently designed curves into a one-way counterclockwise circular path. This design eliminates the possibilities for T-bone and head-on collisions. In addition, a conventional 4-way intersection has 32 points of vehicle conflict due to the different maneuvers through the intersection. A roundabout has 8 points of conflict, which all occur in the same direction, reducing crash severity and likelihood of injury.
842	A shared-use path was part of some early versions of the project, but the right of way impacts along Bluegrass Village and the Kennedy Center were significant. Due to these detrimental impacts the shared use path was removed from the alternatives that were advanced to the EA. The sidewalk design has been extended from the western end of the project area along Greenbag Road to the Dorsey Avenue/Kingwood Pike intersection. At the intersection the sidewalk follows Dorsey Avenue north to Luckey Lane and east on Luckey Lane to the connection with the existing sidewalk at Mountainview Elementary School. The shoulder along the north side of Greenbag Road is being designed to accommodate

	bicycle use by being wider (3 feet) than the standard shoulder (2 feet). Extensions beyond the scope of this project can be considered during future planning. Thank you for enumerating the safety concerns and the proposed HAWK beacon crosswalk. Pedestrians should use the dedicated crosswalks when safely crossing the roundabouts, just like crossing any other intersection. At a roundabout, pedestrian crosswalks will be placed to cross each roadway leg to the roundabout, which is the same as traditional intersection crossings. The roundabout pedestrian crosswalk placement allows pedestrians to cross one direction of traffic a time at each roundabout approach because of the splitter island. Pedestrians should also use the designated crosswalk locations. Roundabouts help reduce the likelihood and severity of collisions. Studies by the Federal Highway Administration (FHWA) have shown that roundabouts typically achieve reduction in overall collisions, injury collisions, fatality collisions, and pedestrian collisions. Reasons for these reductions due to the installation of a roundabout include: Low travel speeds – Drivers must slow down and yield to traffic before entering a roundabout. The reduction in speeds results in a decrease in crash severity and injury. No traffic light "to beat" – The design of a roundabout promotes a continuous circular flow of traffic. Because of this design, drivers will not have the incentive to speed up to "beat the light", like they may at a traditional intersection. One way travel – The design of a roundabout directs drivers through gently designed curves into a one-way counterclockwise circular path. This design eliminates the possibilities for T-bone and head-on collisions. In addition, a conventional 4-way intersection has 32 points of vehicle conflict due to the different maneuvers through the intersection. A roundabout has 8 points of conflict, which all occur in the same direction, reducing crash severity and likelihood of injury.
843	One of the major differences between Greenbag Road and the Mileground, is the volume of traffic. Greenbag Road has less than half the traffic volume that Mileground has. A second major difference is the general configuration of the roundabouts. The proposed roundabouts on Greenbag are more straightforward and more traditional roundabout designs, without all of the confusing lanes that are present at Mileground. The roundabouts on Greenbag Road will be more intuitive for drivers. The sidewalk design has been extended from the western end of the project area along Greenbag Road to the Dorsey Avenue/Kingwood Pike intersection. At the intersection the sidewalk follows Dorsey Avenue north to Luckey Lane and east on Luckey Lane to the connection with the existing sidewalk at Mountainview Elementary School. The shoulder along the north side of Greenbag Road is being designed to accommodate bicycle use by being wider (3 feet) than the standard shoulder (2 feet). Extensions beyond the scope of this project can be considered during

	future planning. Thank you for enumerating the safety concerns and the proposed HAWK beacon. The WVDOH will examine all safety concerns as part of the final design. Pedestrians should use the dedicated crosswalks when safely crossing the roundabouts, just like crossing any other intersection. At a roundabout, pedestrian crosswalks will be placed to cross each roadway leg to the roundabout, which is the same as traditional intersection crossings. The roundabout pedestrian crosswalk placement allows pedestrians to cross one direction of traffic a time at each roundabout approach because of the splitter island. Pedestrians should also use the designated crosswalk locations. Roundabouts help reduce the likelihood and severity of collisions. Studies by the Federal Highway Administration (FHWA) have shown that roundabouts typically achieve reduction in overall collisions, injury collisions, fatality collisions, and pedestrian collisions. Reasons for these reductions due to the installation of a roundabout include: Low travel speeds – Drivers must slow down and yield to traffic before entering a roundabout. The reduction in speeds results in a decrease in crash severity and injury. No traffic light "to beat" – The design of a roundabout promotes a continuous circular flow of traffic. Because of this design, drivers will not have the incentive to speed up to "beat the light", like they may at a traditional intersection. One way travel – The design of a roundabout directs drivers through gently designed curves into a one-way counterclockwise circular path. This design eliminates the possibilities for T-bone and head-on collisions. In addition, a conventional 4-way intersection has 32 points of vehicle conflict due to the different maneuvers through the intersection. A roundabout has 8 points of conflict, which all occur in the same direction, reducing crash severity and likelihood of injury.
844	Conscious Harvest Cooperative Community Garden, Joy and Hemp Universal LLC, and Mockingbird Hill Farms are located on private property and the property owner will be compensated for the sale of any land to the WVDOH during the right-of-way acquisition process. Impacts to this parcel have been minimized to the extent practicable. Approximately 1.56 acres (67,900 square feet) will be required from the parcel. Fair market value will be paid for all properties that require full or partial acquisition as a result of the project. When only part of the property is required, as is the case with this parcel, fair market value of the part taken will be paid, plus damages, if any, to the residue, less all benefits. West Virginia law defines "market value" as the price a willing buyer would pay a willing seller, neither acting under compulsion nor duress, both exercising prudence and intelligent judgment as to its value and familiar with the purpose for which the property is reasonably available. Fair market value will be determined by a competent, professional real estate appraiser after a thorough inspection of the property, a comparison with similar properties in the area that have been sold recently, a determination and consideration of its replacement cost and depreciation and

	consideration of the income-producing potential. All appraisal reports are office-reviewed, then rechecked in the field by experienced, qualified review appraisers for accuracy. Since the Division of Highways has adopted a firm price policy, the property owner will be offered the full amount of the approved appraisal. There will be no attempt to buy property at less than fair market value. This policy guarantees that all citizens of the state receive full value for the money expended for highway rights of way. Those who hold a valid property interest in the property that is acquired for the project will be compensated during the ROW acquisition phase. The turn lane options that were examined do not improve the level of service as much as the roundabout and the turn lanes at Dorsey Avenue/Kingwood Pike involve complete takes of 2 residences and 1 business. This change will be noted in the FONSI. Adding only left turn lanes on Greenbag Road at the Dorsey/Kingwood Pike intersection was evaluated during an initial round of traffic analysis because this option had been suggested by the MPO. The option included upgrading the signal lights to have a protected/permissive left turn phase. The analysis showed that this option would result in some intersection improvements but could not achieve LOS C or better for the overall intersection operation. The overall intersection would operate at an unacceptable LOS (LOS E or F). The eastbound Greenbag Road traffic queue would extend past the Bluegrass Village Driveway. Based on these findings this option was replaced with Options D and E for the EA analysis.
845	Conscious Harvest Cooperative Community Garden, Joy and Hemp Universal LLC, and Mockingbird Hill Farms are located on private property and the property owner will be compensated for the sale of any land to the WVDOH during the right-of-way acquisition process. Impacts to this parcel have been minimized to the extent practicable. Approximately 1.56 acres (67,900 square feet) will be required from the parcel. Fair market value will be paid for all properties that require full or partial acquisition as a result of the project. When only part of the property is required, as is the case with this parcel, fair market value of the part taken will be paid, plus damages, if any, to the residue, less all benefits. West Virginia law defines “market value” as the price a willing buyer would pay a willing seller, neither acting under compulsion nor duress, both exercising prudence and intelligent judgment as to its value and familiar with the purpose for which the property is reasonably available. Fair market value will be determined by a competent, professional real estate appraiser after a thorough inspection of the property, a comparison with similar properties in the area that have been sold recently, a determination and consideration of its replacement cost and depreciation and consideration of the income-producing potential. Those who hold a valid property interest in the property that is acquired for the project will be compensated during the ROW acquisition phase.

	The turn lane options that were examined do not improve the level of service as much as the roundabout and the turn lanes at Dorsey Avenue/Kingwood Pike involve complete takes of 2 residences and 1 business. This change will be noted in the FONSI. Adding only left turn lanes on Greenbag Road at the Dorsey/Kingwood Pike intersection was evaluated during an initial round of traffic analysis because this option had been suggested by the MPO. The option included upgrading the signal lights to have a protected/permissive left turn phase. The analysis showed that this option would result in some intersection improvements but could not achieve LOS C or better for the overall intersection operation. The overall intersection would operate at an unacceptable LOS (LOS E or F). The eastbound Greenbag Road traffic queue would extend past the Bluegrass Village Driveway. Based on these findings this option was replaced with Options D and E for the EA analysis. The EA reported impacts to Federal Farmland Protection Policy Act (FPPA) soils. The entire Greenbag Road environmental study area is encompassed by "land already in or committed to urban development" as defined by the FPPA (see 7 CFR § 658.2 - Definitions) and is therefore not subject to provisions of FPPA. Please refer to the Farmland Appendix attached to the FONSI for further detail.
846	A shared-use path was part of some early versions of the project, but the right of way impacts along Bluegrass Village and the Kennedy Center were significant. Due to these detrimental impacts the shared use path was removed from the alternatives that were advanced to the EA. The sidewalk design has been extended from the western end of the project area along Greenbag Road to the Dorsey Avenue/Kingwood Pike intersection. At the intersection the sidewalk follows Dorsey Avenue north to Luckey Lane and east on Luckey Lane to the connection with the existing sidewalk at Mountainview Elementary School. The shoulder along the north side of Greenbag Road is being designed to accommodate bicycle use by being wider (3 feet) than the standard shoulder (2 feet). Extensions beyond the scope of this project can be considered during future planning. Thank you for enumerating the safety concerns and the proposed HAWK beacon. The WVDOH will examine all safety concerns as part of the final design. Pedestrians should use the dedicated crosswalks when safely crossing the roundabouts, just like crossing any other intersection. At a roundabout, pedestrian crosswalks will be placed to cross each roadway leg to the roundabout, which is the same as traditional intersection crossings. The roundabout pedestrian crosswalk placement allows pedestrians to cross one direction of traffic a time at each roundabout approach because of the splitter island. Pedestrians should also use the designated crosswalk locations. Roundabouts help reduce the likelihood and severity of collisions. Studies by the Federal Highway Administration (FHWA) have shown that roundabouts typically achieve reduction in overall collisions, injury collisions, fatality collisions, and pedestrian collisions. Reasons for these reductions due to the installation of a roundabout include: Low travel speeds – Drivers must slow down and yield to traffic before entering a roundabout. The reduction in speeds results in a decrease in crash severity and injury.

	No traffic light "to beat" – The design of a roundabout promotes a continuous circular flow of traffic. Because of this design, drivers will not have the incentive to speed up to "beat the light", like they may at a traditional intersection. One way travel – The design of a roundabout directs drivers through gently designed curves into a one-way counterclockwise circular path. This design eliminates the possibilities for T-bone and head-on collisions. In addition, a conventional 4-way intersection has 32 points of vehicle conflict due to the different maneuvers through the intersection. A roundabout has 8 points of conflict, which all occur in the same direction, reducing crash severity and likelihood of injury.
847	A shared-use path was part of some early versions of the project, but the right of way impacts along Bluegrass Village and the Kennedy Center were significant. Due to these detrimental impacts the shared use path was removed from the alternatives that were advanced to the EA. A mid-block crossing to connect the north and south sides of Greenbag Road in the vicinity of Mountaineer Mall can be examined during the final design phase.
848	Both the MMMPO corridor study and the 2018 traffic study determined that traffic flow through the corridor is controlled by the congestion at the major intersections in the corridor. The projected growth in the Morgantown area will continue to increase traffic and congestion at the intersections if improvements do not occur. The EA reviewed multiple alternatives including turn lanes, traffic lights, and the roundabouts. Through the analysis in the EA, the only alternative that meets the purpose and need of the project is the roundabout. The preliminary investigation and engineering traffic study was completed to evaluate the Greenbag Road corridor, evaluating the existing and potential future operation of the intersections selected for study by WVDOH. The evaluation of existing roadway conditions, including the existing roadway conditions of Kingwood Pike, was not part of the preliminary investigation and engineering traffic study. The Greenbag Road corridor has long been recognized as a challenging roadway to navigate due to geometric deficiencies, significant intersection delays during the peak hours, and increased volume of truck traffic and development within the corridor. Several studies have been previously completed through the MMMPO, evaluating various transportation plans for the Greenbag Road corridor, with the ultimate vision of transforming Greenbag Road into a safe, efficient, and attractive multimodal transportation facility. The future traffic along Greenbag Road, Mississippi Avenue, Dorsey Avenue, Kingwood Pike were projected for the future design year by assuming existing traffic distribution/patterns but with increased traffic volumes though application of a yearly traffic growth rate of 1.16% per year. It should be noted that the traffic evaluation was completed prior to the COVID-19 pandemic and its effects to traffic currently occurring.

	Road repair beyond the scope of this project is being addressed through the Governor's Roads to Prosperity program and progress can be tracked via the WVDOH website.
849	The design speed of 35 mph was not considered during the Greenbag Road PIE Traffic Study. The posted speed limit along Greenbag Road within the study area is 40 mph. Automatic traffic recorder (ATR) counts were conducted on various segments of Greenbag Road throughout the study area. The ATR counts recorded the 85th percentile speeds, which is the speed at or below which 85 percent of the motorists drive. The recorded speeds obtained during the September 2018 – October 2018 counts indicate that most traffic is traveling at or below 45 mph. It is anticipated that a reduction of the posted speed limit to 35 mph would have minimal impact to the current traveling speeds along Greenbag Road. Roundabouts help reduce the likelihood and severity of collisions. Studies by the Federal Highway Administration (FHWA) have shown that roundabouts typically achieve reduction in overall collisions, injury collisions, fatality collisions, and pedestrian collisions. Reasons for these reductions due to the installation of a roundabout include: Low travel speeds – Drivers must slow down and yield to traffic before entering a roundabout. The reduction in speeds results in a decrease in crash severity and injury. No traffic light "to beat" – The design of a roundabout promotes a continuous circular flow of traffic. Because of this design, drivers will not have the incentive to speed up to "beat the light", like they may at a traditional intersection. One way travel – The design of a roundabout directs drivers through gently designed curves into a one-way counterclockwise circular path. This design eliminates the possibilities for T-bone and head-on collisions. In addition, a conventional 4-way intersection has 32 points of vehicle conflict due to the different maneuvers through the intersection. A roundabout has 8 points of conflict, which all occur in the same direction, reducing crash severity and likelihood of injury. A shared-use path was part of some early versions of the project, but the right of way impacts along Bluegrass Village and the Kennedy Center were significant. Due to these detrimental impacts the shared use path was removed from the alternatives that were advanced to the EA. A mid-block crossing to connect the north and south sides of Greenbag Road in the vicinity of Mountaineer Mall can be examined during the final design phase.
850	The proposed project includes improvements to an existing transportation facility and the construction of the project is not expected to stimulate secondary growth, affect land use decisions, or induce land use change. Therefore, the project is not expected to result in light pollution impacts that are significantly worse than conditions currently present within the project area. The lighting layout for the roundabout will be

	developed during final design. The lighting will be designed to attempt to minimize light pollution while maintaining FHWA and WVDOH standards and requirements for lighting of the roundabout.
851	The EA reported impacts to Federal Farmland Protection Policy Act (FPPA) soils. The entire Greenbag Road environmental study area is encompassed by "land already in or committed to urban development" as defined by the FPPA (see 7 CFR § 658.2 - Definitions) and is therefore not subject to provisions of FPPA. Please refer to the Farmland Appendix attached to the FONSI for further detail. Conscious Harvest Cooperative Community Garden, Joy and Hemp Universal LLC, and Mockingbird Hill Farms are located on private property and the property owner will be compensated for the sale of any land to the WVDOH during the right-of-way acquisition process. Impacts to this parcel have been minimized to the extent practicable. Approximately 1.56 acres (67,900 square feet) will be required from the parcel. Fair market value will be paid for all properties that require full or partial acquisition as a result of the project. When only part of the property is required, as is the case with this parcel, fair market value of the part taken will be paid, plus damages, if any, to the residue, less all benefits. West Virginia law defines "market value" as the price a willing buyer would pay a willing seller, neither acting under compulsion nor duress, both exercising prudence and intelligent judgment as to its value and familiar with the purpose for which the property is reasonably available. Fair market value will be determined by a competent, professional real estate appraiser after a thorough inspection of the property, a comparison with similar properties in the area that have been sold recently, a determination and consideration of its replacement cost and depreciation and consideration of the income-producing potential. All appraisal reports are office-reviewed, then rechecked in the field by experienced, qualified review appraisers for accuracy. Since the Division of Highways has adopted a firm price policy, the property owner will be offered the full amount of the approved appraisal. There will be no attempt to buy property at less than fair market value. This policy guarantees that all citizens of the state receive full value for the money expended for highway rights of way. Those who hold a valid property interest in the property that is acquired for the project will be compensated during the ROW acquisition phase.
852	The turn lane options that were examined do not improve the level of service as much as the roundabout and the turn lanes at Dorsey Avenue/Kingwood Pike involve complete takes of 2 residences and 1 business. This change will be noted in the FONSI. Adding only left turn lanes on Greenbag Road at the Dorsey/Kingwood Pike intersection was evaluated during an initial round of traffic analysis because this option had been suggested by the MPO. The option included upgrading the signal lights to have a protected/permissive left turn phase. The analysis showed that this option would result in some intersection improvements but could not achieve LOS C or better for the overall intersection operation. The overall intersection would operate at an unacceptable LOS (LOS E or F). The eastbound Greenbag Road traffic queue would extend past the Bluegrass Village Driveway. Based on these findings this option was replaced with Options D and E for the EA analysis.

	Roundabouts help reduce the likelihood and severity of collisions. Studies by the Federal Highway Administration (FHWA) have shown that roundabouts typically achieve reduction in overall collisions, injury collisions, fatality collisions, and pedestrian collisions. Reasons for these reductions due to the installation of a roundabout include: Low travel speeds – Drivers must slow down and yield to traffic before entering a roundabout. The reduction in speeds results in a decrease in crash severity and injury. No traffic light "to beat" – The design of a roundabout promotes a continuous circular flow of traffic. Because of this design, drivers will not have the incentive to speed up to "beat the light", like they may at a traditional intersection. One way travel – The design of a roundabout directs drivers through gently designed curves into a one-way counterclockwise circular path. This design eliminates the possibilities for T-bone and head-on collisions. In addition, a conventional 4-way intersection has 32 points of vehicle conflict due to the different maneuvers through the intersection. A roundabout has 8 points of conflict, which all occur in the same direction, reducing crash severity and likelihood of injury. In regards to cost, since the traffic analysis determined that left turn lanes on Greenbag Road did not meet WVDOH's LOS criteria, a cost estimate was not prepared. However, long-term costs associated with roundabouts are significantly less than a traffic signal, since no electrical costs and no traffic signal maintenance are involved with a roundabout.
853	The EA reported impacts to Federal Farmland Protection Policy Act (FPPA) soils. The entire Greenbag Road environmental study area is encompassed by "land already in or committed to urban development" as defined by the FPPA (see 7 CFR § 658.2 - Definitions) and is therefore not subject to provisions of FPPA. Please refer to the Farmland Appendix attached to the FONSI for further detail. LESA criteria are used under the FPPA. An FPPA review of the project shows that the entire project corridor is within land designated as urbanized area on the US Census Bureau Map and is considered land already in or committed to urban development by the act. Therefore, the Land Evaluation and Site Assessment is not applicable to this project. Conscious Harvest Cooperative Community Garden, Joy and Hemp Universal LLC, and Mockingbird Hill Farms are located on private property and the property owner will be compensated for the sale of any land to the WVDOH during the right-of-way acquisition process. Impacts to this parcel have been minimized to the extent practicable. Approximately 1.56 acres (67,900 square feet) will be required from the parcel. Fair market value will be paid for all properties that require full or partial acquisition as a result of the project. When only part of the property is required, as is the case with this parcel, fair market value of the part taken will be paid, plus damages, if any, to the residue, less all benefits. West Virginia law defines "market value" as the price a willing buyer would pay a willing seller, neither acting under compulsion nor duress, both

	exercising prudence and intelligent judgment as to its value and familiar with the purpose for which the property is reasonably available. Fair market value will be determined by a competent, professional real estate appraiser after a thorough inspection of the property, a comparison with similar properties in the area that have been sold recently, a determination and consideration of its replacement cost and depreciation and consideration of the income-producing potential. All appraisal reports are office-reviewed, then rechecked in the field by experienced, qualified review appraisers for accuracy. Since the Division of Highways has adopted a firm price policy, the property owner will be offered the full amount of the approved appraisal. There will be no attempt to buy property at less than fair market value. This policy guarantees that all citizens of the state receive full value for the money expended for highway rights of way. Those who hold a valid property interest in the property that is acquired for the project will be compensated during the ROW acquisition phase.
854	Conscious Harvest Cooperative Community Garden, Joy and Hemp Universal LLC, and Mockingbird Hill Farms are located on private property and the property owner will be compensated for the sale of any land to the WVDOH during the right-of-way acquisition process. Those who hold a valid property interest in the property that is acquired for the project will be compensated during the ROW acquisition phase.

	The option proposed here was one of the options suggested by the MMMPO study (adding left turn lanes only on Greenbag Rd at the Dorsey/Kingwood Pike) and was included on the first round of traffic analysis submitted to the WVDOH in February of 2019. This scenario also included upgrading the existing 2-phase traffic signal to 3-phases to incorporate a protected/permissive left turn phase. Installation of the turn lanes and modifying the signal phasing resulted in various approach and overall intersection LOS improvements; however, LOS C or better for the overall intersection operation could not be achieved. It was projected that some movements and the overall intersection would operate at an unacceptable level of service (LOS E or F). During the PM peak hour, the overall intersection is projected to operate at an overall intersection LOS E, and the eastbound through movement is forecasted to operate at a LOS F. This option would result in the Greenbag Road and Dorsey Avenue approaches queue lengths increasing. The eastbound Greenbag Road through movement queue will continue to extend past the Bluegrass Village driveway. Based on these findings and at the direction of the WVDOH, the traffic analysis was revised using additional options, which developed into Options D and E examined for the EA. The left turn lane only on Greenbag Road was not developed further and no impacts were assessed for the EA. The final decision for the project will be made by the WVDOH and FHWA. The cultural resources surveys were conducted according to the guidelines published by the WV State Historic Preservation Office. The archaeological survey included the excavation of 213 shovel test pits, one test excavation unit, and visual inspection of the entire surface area within the defined area of potential effect. Based on the SHPO guidelines, when no cultural resources are identified during the Phase I survey, an abbreviated technical report is acceptable. As the reviewing agency, the WV SHPO concurred with the recommendation that no further archaeological investigations were warranted and no archaeological historic properties are present in the study area. The historic structures survey resulted in the identification of 25 structures 45+ years old within the defined area of potential effect. Two of the resources were recommended eligible for the National Register of Historic Places and the project was designed to avoid potential impacts to these properties. As the reviewing agency, the WV SHPO concurred with the recommendation that the project would not adversely affect any NRHP eligible resources and that no further historic structures investigations were needed. The cultural resources reports are available as an Appendix to the EA on the WVDOH website at https://transportation.wv.gov/highways/engineering/comment/closed/greenbagroadimprovementproject/Pages/default.aspx.
857	We appreciate your input regarding the project.
858	The preliminary investigation and engineering traffic study has examined two build alternatives and three options for each of the major intersections. The intersection options that were evaluated and analyzed include turning lanes, traffic signals, and roundabouts. WVDOH requires intersection improvements to meet or exceed an overall intersection LOS C or better during the peak hours studied for design year

	improvements. The times of day (peak hours) selected to be studied followed WVDOH guidelines and is standard traffic engineering practice for determining future intersection improvements. At the intersection of Greenbag Road/Dorsey Avenue/Kingwood Pike the traffic analysis determined that the intersection would operate at failure (overall intersection LOS F) if existing intersection conditions and operations were to remain the same 30-years in the future (design year) without any improvements. Adding only left turn lanes on Greenbag Road at the Dorsey/Kingwood Pike intersection was evaluated during an initial round of traffic analysis because this option had been suggested by the MPO. The option included upgrading the signal lights to have a protected/permissive left turn phase. The analysis showed that this option would result in some intersection improvements but could not achieve LOS C or better for the overall intersection operation. The overall intersection would operate at an unacceptable LOS (LOS E). In addition, the left turn lane option would result in the eastbound Greenbag Road traffic queue to extend past the Bluegrass Village Driveway. The traffic analysis determined that with installation of a roundabout the overall intersection would operate at a LOS C, meeting WVDOH design year criteria. At the intersection of Greenbag Road/Mississippi Avenue the traffic analysis determined that the intersection would operate at failure (overall intersection LOS F) if existing intersection conditions and operations were to remain the same 30-years in the future (design year) without any improvements. The design year with improvements scenarios evaluated determined that with installation of a roundabout the overall intersection would operate at a LOS A, best operating conditions, for all peak hours studied. Installation of a traffic signal with turn lanes resulted in an overall intersection LOS B during the AM peak hour, with the Mississippi Avenue approach operating at a LOS C. Though the analysis meets WVDOH minimum LOS criteria, the roundabout option exceeds WVDOH minimum LOS criteria. Roundabouts help reduce vehicular delay and promotes a continuous flow of traffic, which increases traffic capacity at an intersection. The roundabouts have been designed with larger vehicles in mind and incorporate truck aprons to support the weight and turning radius of larger vehicles, including school buses. In addition, roundabouts help reduce the likelihood and severity of collisions. Studies by the Federal Highway Administration (FHWA) have shown that roundabouts typically achieve reduction in overall collisions, injury collisions, fatality collisions, and pedestrian collisions. Reasons for these reductions due to the installation of a roundabout include: - Low travel speeds – Drivers must slow down and yield to traffic before entering a roundabout. The reduction in speeds results in a decrease in crash severity and injury. - No traffic light “to beat” – The design of a roundabout promotes a continuous circular flow of traffic. Because of this design, drivers will not have the incentive to speed up to “beat the light”, like they may at a traditional intersection. - One way travel – The design of a roundabout directs drivers through gently designed curves into a one-way counterclockwise circular path. This design eliminates the possibilities for T-bone and head-on collisions.

	In addition, a conventional 4-way intersection has 32 points of vehicle conflict due to the different crossings and maneuvers through the intersection. A roundabout has 8 points of conflict, which all occur in the same direction, reducing crash severity and likelihood of injury. Lastly, long-term costs associated with roundabouts are significantly less than a traffic signal, since no electrical costs and no traffic signal maintenance costs are involved with a roundabout. The traffic control plan will continue to be revised during final design, and will not use Aaron's Creek Road as a signed detour. The revised plan intends to utilize the center of the Dorsey/Kingwood roundabout as a temporary intersection with temporary traffic signals. A short-term detour is proposed using Summers School Road while constructing the connection of the existing Kingwood Pike with the new portion. The sidewalk design has been extended from the western end of the project area along Greenbag Road to the Dorsey Avenue/Kingwood Pike intersection. At the intersection the sidewalk follows Dorsey Avenue north to Luckey Lane and east on Luckey Lane to the connection with the existing sidewalk at Mountainview Elementary School. The shoulder along the north side of Greenbag Road is being designed to accommodate bicycle use by being wider (3 feet) than the standard shoulder (2 feet). Pedestrians should use the dedicated crosswalks when safely crossing the roundabouts, just like crossing any other intersection. At a roundabout, pedestrian crosswalks will be placed to cross each roadway leg to the roundabout, which is the same as traditional intersection crossings. The roundabout pedestrian crosswalk placement allows pedestrians to cross one direction of traffic a time at each roundabout approach because of the splitter island. Pedestrians should also use the designated crosswalk locations. Roundabouts help reduce the likelihood and severity of collisions. Studies by the Federal Highway Administration (FHWA) have shown that roundabouts typically achieve reduction in overall collisions, injury collisions, fatality collisions, and pedestrian collisions. Reasons for these reductions due to the installation of a roundabout include: Low travel speeds – Drivers must slow down and yield to traffic before entering a roundabout. The reduction in speeds results in a decrease in crash severity and injury. No traffic light "to beat" – The design of a roundabout promotes a continuous circular flow of traffic. Because of this design, drivers will not have the incentive to speed up to "beat the light", like they may at a traditional intersection. One way travel – The design of a roundabout directs drivers through gently designed curves into a one-way counterclockwise circular path. This design eliminates the possibilities for T-bone and head-on collisions.

	In addition, a conventional 4-way intersection has 32 points of vehicle conflict due to the different maneuvers through the intersection. A roundabout has 8 points of conflict, which all occur in the same direction, reducing crash severity and likelihood of injury.
859	The option proposed here was one of the options suggested by the MMMPO study (adding left turn lanes only on Greenbag Rd at the Dorsey/Kingwood Pike) and was included on the first round of traffic analysis submitted to the WVDOH in February of 2019. This scenario also included upgrading the existing 2-phase traffic signal to 3-phases to incorporate a protected/permissive left turn phase. Installation of the turn lanes and modifying the signal phasing resulted in various approach and overall intersection LOS improvements; however, LOS C or better for the overall intersection operation could not be achieved. It was projected that some movements and the overall intersection would operate at an unacceptable level of service (LOS E or F). During the PM peak hour, the overall intersection is projected to operate at an overall intersection LOS E, and the eastbound through movement is forecasted to operate at a LOS F. This option would result in the Greenbag Road and Dorsey Avenue approaches queue lengths increasing. The eastbound Greenbag Road through movement queue will continue to extend past the Bluegrass Village driveway. Based on these findings and at the direction of the WVDOH, the traffic analysis was revised using additional options, which developed into Options D and E examined for the EA. The left turn lane only on Greenbag Road was not developed further and no impacts were assessed for the EA. During final design, further avoidance and/or minimization measures will be considered and/or implemented as appropriate to reduce the total impacts to streams. Specific Best Management Practices will be developed prior to construction to reduce the amount of disturbed aquatic habitat and riparian vegetation; minimize opportunities for increased sedimentation during construction; revegetate all disturbed areas to prevent accelerated erosion; designate equipment fueling and service areas away from aquatic habitats; and designate and construct all stormwater management facilities to prevent runoff. Coordination with resource agencies will continue throughout construction activities as necessary. The stormwater management plan for this project will meet the volume and rate requirements of the Morgantown Utility Board and WVDOH policies. Due to the existing topography and features it is likely that these requirements will require basins and other stormwater BMP's, such as vegetated swales. The amount of offsite runoff to the streams and wetlands will be minimized where practicable in order to limit basin size and meet the design criteria. Stormwater design for the project will be completed during final design and will minimize the impacts to the streams and wetlands located within and adjacent to the project right of way. The EA reported impacts to Federal Farmland Protection Policy Act (FPPA) soils. The entire Greenbag Road environmental study area is encompassed by "land already in or committed to urban development" as defined by the FPPA (see 7 CFR § 658.2 - Definitions) and is therefore not subject to provisions of FPPA. Please refer to the Farmland Appendix attached to the FONSI for further detail.

	Conscious Harvest Cooperative Community Garden, Joy and Hemp Universal LLC, and Mockingbird Hill Farms are located on private property and the property owner will be compensated for the sale of any land to the WVDOH during the right-of-way acquisition process. Impacts to this parcel have been minimized to the extent practicable. Approximately 1.56 acres (67,900 square feet) will be required from the parcel. Fair market value will be paid for all properties that require full or partial acquisition as a result of the project. When only part of the property is required, as is the case with this parcel, fair market value of the part taken will be paid, plus damages, if any, to the residue, less all benefits. West Virginia law defines "market value" as the price a willing buyer would pay a willing seller, neither acting under compulsion nor duress, both exercising prudence and intelligent judgment as to its value and familiar with the purpose for which the property is reasonably available. Fair market value will be determined by a competent, professional real estate appraiser after a thorough inspection of the property, a comparison with similar properties in the area that have been sold recently, a determination and consideration of its replacement cost and depreciation and consideration of the income-producing potential. All appraisal reports are office-reviewed, then rechecked in the field by experienced, qualified review appraisers for accuracy. Since the Division of Highways has adopted a firm price policy, the property owner will be offered the full amount of the approved appraisal. There will be no attempt to buy property at less than fair market value. This policy guarantees that all citizens of the state receive full value for the money expended for highway rights of way. Those who hold a valid property interest in the property that is acquired for the project will be compensated during the ROW acquisition phase. The cultural resources surveys were conducted according to the guidelines published by the WV State Historic Preservation Office. The archaeological survey included the excavation of 213 shovel test pits, one test excavation unit, and visual inspection of the entire surface area within the defined area of potential effect. Based on the SHPO guidelines, when no cultural resources are identified during the Phase I survey, an abbreviated technical report is acceptable. As the reviewing agency, the WV SHPO concurred with the recommendation that no further archaeological investigations were warranted and no archaeological historic properties are present in the study area. The historic structures survey resulted in the identification of 25 structures 45+ years old within the defined area of potential effect. Two of the resources were recommended eligible for the National Register of Historic Places and the project was designed to avoid potential impacts to these properties. As the reviewing agency, the WV SHPO concurred with the recommendation that the project would not adversely affect any NRHP eligible resources and that no further historic structures investigations were needed. The cultural resources reports are available as an Appendix to the EA on the WVDOH website at https://transportation.wv.gov/highways/engineering/comment/closed/greenbagroadimprovementproject/Pages/default.aspx. In regards to cost, since the traffic analysis determined that left turn lanes on Greenbag Road did not meet WVDOH's LOS criteria, a cost estimate was not prepared. However, long-term costs associated with roundabouts are significantly less than a traffic signal, since no electrical costs and no traffic signal maintenance are involved with a roundabout.

860	The turn lane options that were examined do not improve the level of service as much as the roundabout and the turn lanes at Dorsey Avenue/Kingwood Pike involve complete takes of 2 residences and 1 business. This change will be noted in the FONSI. Adding only left turn lanes on Greenbag Road at the Dorsey/Kingwood Pike intersection was evaluated during an initial round of traffic analysis because this option had been suggested by the MPO. The option included upgrading the signal lights to have a protected/permissive left turn phase. The analysis showed that this option would result in some intersection improvements but could not achieve LOS C or better for the overall intersection operation. The overall intersection would operate at an unacceptable LOS (LOS E or F). The eastbound Greenbag Road traffic queue would extend past the Bluegrass Village Driveway. Based on these findings this option was replaced with Options D and E for the EA analysis. In regards to cost, since the traffic analysis determined that left turn lanes on Greenbag Road did not meet WVDOH's LOS criteria, a cost estimate was not prepared. However, long-term costs associated with roundabouts are significantly less than a traffic signal, since no electrical costs and no traffic signal maintenance are involved with a roundabout.
861	The EA reviewed multiple alternatives including turn lanes, traffic lights, and the roundabouts. Through the analysis in the EA, the only alternative that meets the purpose and need of the project is the roundabout. The turn lane options that were examined do not improve the level of service as much as the roundabout and the turn lanes at Dorsey Avenue/Kingwood Pike involve complete takes of 2 residences and 1 business. This change will be noted in the FONSI. Adding only left turn lanes on Greenbag Road at the Dorsey/Kingwood Pike intersection was evaluated during an initial round of traffic analysis because this option had been suggested by the MPO. The option included upgrading the signal lights to have a protected/permissive left turn phase. The analysis showed that this option would result in some intersection improvements but could not achieve LOS C or better for the overall intersection operation. The overall intersection would operate at an unacceptable LOS (LOS E or F). The eastbound Greenbag Road traffic queue would extend past the Bluegrass Village Driveway. Based on these findings this option was replaced with Options D and E for the EA analysis. Every roundabout is designed and adapted to the context of its location.
862	The EA reviewed multiple alternatives including turn lanes, traffic lights, and the roundabouts. Through the analysis in the EA, the only alternative that meets the purpose and need of the project is the roundabout. The existing grade on Kingwood Pike requires stopping on a -6.5% grade at the traffic signal. The grade approaching the roundabout includes a flat grade of less than 2% at the roundabout. In most cases, the roundabout will not require approaching traffic to come to a full or immediate stop, and does not queue traffic on the steep grade as the existing traffic signal does.

	Roundabouts help reduce the likelihood and severity of collisions. Studies by the Federal Highway Administration (FHWA) have shown that roundabouts typically achieve reduction in overall collisions, injury collisions, fatality collisions, and pedestrian collisions. Reasons for these reductions due to the installation of a roundabout include: - Low travel speeds – Drivers must slow down and yield to traffic before entering a roundabout. The reduction in speeds results in a decrease in crash severity and injury. - No traffic light "to beat" – The design of a roundabout promotes a continuous circular flow of traffic. Because of this design, drivers will not have the incentive to speed up to "beat the light", like they may at a traditional intersection. - One way travel – The design of a roundabout directs drivers through gently designed curves into a one-way counterclockwise circular path. This design eliminates the possibilities for T-bone and head-on collisions. In addition, a conventional 4-way intersection has 32 points of vehicle conflict due to the different crossings and maneuvers through the intersection. A roundabout has 8 points of conflict, which all occur in the same direction, reducing crash severity and likelihood of injury. Lastly, long-term costs associated with roundabouts are significantly less than a traffic signal, since no electrical costs and no traffic signal maintenance costs are involved with a roundabout. One of the major differences between Greenbag Road and the Mileground, is the volume of traffic. Greenbag Road has less than half the traffic volume that Mileground has. A second major difference is the general configuration of the roundabouts. The proposed roundabouts on Greenbag are more straightforward and more traditional roundabout designs, without all of the confusing lanes that are present at Mileground. The roundabouts on Greenbag Road will be more intuitive for drivers. Every roundabout is designed and adapted to the context of its location. The WVDOH has an educational video on how to use a roundabout available for viewing at https://www.youtube.com/watch?v=7njH4MKyo0w.
863	The EA reviewed multiple alternatives including turn lanes, traffic lights, and the roundabouts. Through the analysis in the EA, the only alternative that meets the purpose and need of the project is the roundabout. The turn lane options that were examined do not improve the level of service as much as the roundabout and the turn lanes at Dorsey Avenue/Kingwood Pike involve complete takes of 2 residences and 1 business. This change will be noted in the FONSI. Adding only left turn lanes on Greenbag Road at the Dorsey/Kingwood Pike intersection was evaluated during an initial round of traffic analysis because this option had been suggested by the MPO. The option included upgrading the signal lights to have a protected/permissive left turn phase. The analysis showed that this option would result in some intersection improvements but could not achieve LOS C or better for the overall intersection operation. The overall intersection would operate at an unacceptable LOS (LOS E or F). The eastbound Greenbag Road traffic queue would extend past the Bluegrass Village Driveway. Based on these findings this option was replaced with Options D and E for the EA analysis.

	Long-term costs associated with roundabouts are significantly less than a traffic signal, since no electrical costs and no traffic signal maintenance are involved with a roundabout.
864	The EA reviewed multiple alternatives including turn lanes, traffic lights, and the roundabouts. Through the analysis in the EA, the only alternative that meets the purpose and need of the project is the roundabout. The turn lane options that were examined do not improve the level of service as much as the roundabout and the turn lanes at Dorsey Avenue/Kingwood Pike involve complete takes of 2 residences and 1 business. This change will be noted in the FONSI. Adding only left turn lanes on Greenbag Road at the Dorsey/Kingwood Pike intersection was evaluated during an initial round of traffic analysis because this option had been suggested by the MPO. The option included upgrading the signal lights to have a protected/permissive left turn phase. The analysis showed that this option would result in some intersection improvements but could not achieve LOS C or better for the overall intersection operation. The overall intersection would operate at an unacceptable LOS (LOS E or F). The eastbound Greenbag Road traffic queue would extend past the Bluegrass Village Driveway. Based on these findings this option was replaced with Options D and E for the EA analysis. The roundabouts were designed to accommodate AASHTO WB-62 truck configuration, which is an interstate semi-truck with a 62' wheel base between steer axle and last trailer axle, including a 48' trailer. Larger trucks can navigate the roundabout and use the internal truck apron.
865	The MMMPO had completed several previous studies evaluating various transportation plans for the Greenbag Road corridor, with the ultimate vision of transforming Greenbag Road into a safe, efficient, and attractive multimodal transportation facility. The scenarios determined to be evaluated in the traffic study evolved from the outcome of the MMMPO's preliminary studies and findings. Existing two-way stop controlled operations with potential roadway improvements were evaluated as part of the traffic, as well as traffic signal and roundabout options. The intersection of Greenbag Road/Dorsey Avenue/Kingwood Pike is currently controlled by a traffic signal and not by a four-way (all-way) stop, which includes stop sign control on each approach. The intersection would operate at failure (overall intersection LOS F) if existing intersection conditions and operations (traffic signal control) were to remain the same 30-years in the future (design year) without any improvements. Therefore, traffic analysis was not completed for a four-way (all-way) stop controlled intersection operations. The turn lane options that were examined do not improve the level of service as much as the roundabout and the turn lanes at Dorsey Avenue/Kingwood Pike involve complete takes of 2 residences and 1 business. This change will be noted in the FONSI. Adding only left turn lanes on Greenbag Road at the Dorsey/Kingwood Pike intersection was evaluated during an initial round of traffic analysis because this option had been suggested by the MPO. The option included upgrading the signal lights to have a protected/permissive left turn phase. The analysis showed that this option would result in some intersection improvements but could not achieve LOS C or better for the overall intersection

	operation. The overall intersection would operate at an unacceptable LOS (LOS E or F). The eastbound Greenbag Road traffic queue would extend past the Bluegrass Village Driveway. Based on these findings this option was replaced with Options D and E for the EA analysis. The EA reported impacts to Federal Farmland Protection Policy Act (FPPA) soils. The entire Greenbag Road environmental study area is encompassed by "land already in or committed to urban development" as defined by the FPPA (see 7 CFR § 658.2 - Definitions) and is therefore not subject to provisions of FPPA. Please refer to the Farmland Appendix attached to the FONSI for further detail. Any property needed for the project will be acquired under the Uniform Relocation Assistance and Real Property Acquisition Act (1970) through negotiations with the landowners.
866	The turn lane options that were examined do not improve the level of service as much as the roundabout and the turn lanes at Dorsey Avenue/Kingwood Pike involve complete takes of 2 residences and 1 business. This change will be noted in the FONSI. Adding only left turn lanes on Greenbag Road at the Dorsey/Kingwood Pike intersection was evaluated during an initial round of traffic analysis because this option had been suggested by the MPO. The option included upgrading the signal lights to have a protected/permissive left turn phase. The analysis showed that this option would result in some intersection improvements but could not achieve LOS C or better for the overall intersection operation. The overall intersection would operate at an unacceptable LOS (LOS E or F). The eastbound Greenbag Road traffic queue would extend past the Bluegrass Village Driveway. Based on these findings this option was replaced with Options D and E for the EA analysis. The diversion of traffic from downtown, including large trucks, is not within the scope of this project.
867	The turn lane options that were examined do not improve the level of service as much as the roundabout and the turn lanes at Dorsey Avenue/Kingwood Pike involve complete takes of 2 residences and 1 business. This change will be noted in the FONSI. Adding only left turn lanes on Greenbag Road at the Dorsey/Kingwood Pike intersection was evaluated during an initial round of traffic analysis because this option had been suggested by the MPO. The option included upgrading the signal lights to have a protected/permissive left turn phase. The analysis showed that this option would result in some intersection improvements but could not achieve LOS C or better for the overall intersection operation. The overall intersection would operate at an unacceptable LOS (LOS E or F). The eastbound Greenbag Road traffic queue would extend past the Bluegrass Village Driveway. Based on these findings this option was replaced with Options D and E for the EA analysis. At the intersection of Greenbag Road/Dorsey Avenue/Kingwood Pike the traffic analysis determined that the intersection would operate at failure (overall intersection LOS F) if existing intersection conditions and operations were to remain the same 30-years in the future (design year) without any improvements. Adding only left turn lanes on Greenbag Road at the Dorsey/Kingwood Pike intersection was evaluated during an initial round of traffic analysis because this option had been suggested by the MPO. The option included upgrading the signal lights to have a protected/permissive left turn phase. The analysis showed that this option would result in some intersection improvements but could not achieve LOS C or better for the overall intersection operation. The overall intersection would operate at an unacceptable LOS (LOS E). In

	addition, the left turn lane option would result in the eastbound Greenbag Road traffic queue to extend past the Bluegrass Village Driveway. The traffic analysis determined that with installation of a roundabout the overall intersection would operate at a LOS C, meeting WVDOH design year criteria. At the intersection of Greenbag Road/Mississippi Avenue the traffic analysis determined that the intersection would operate at failure (overall intersection LOS F) if existing intersection conditions and operations were to remain the same 30-years in the future (design year) without any improvements. The design year with improvements scenarios evaluated determined that with installation of a roundabout the overall intersection would operate at a LOS A, best operating conditions, for all peak hours studied. Installation of a traffic signal with turn lanes resulted in an overall intersection LOS B during the AM peak hour, with the Mississippi Avenue approach operating at a LOS C. Though the analysis meets WVDOH minimum LOS criteria, the roundabout option exceeds WVDOH minimum LOS criteria. Roundabouts help reduce vehicular delay and promotes a continuous flow of traffic, which increases traffic capacity at an intersection. Roundabouts help reduce the likelihood and severity of collisions. Studies by the Federal Highway Administration (FHWA) have shown that roundabouts typically achieve reduction in overall collisions, injury collisions, fatality collisions, and pedestrian collisions. Reasons for these reductions due to the installation of a roundabout include: - Low travel speeds – Drivers must slow down and yield to traffic before entering a roundabout. The reduction in speeds results in a decrease in crash severity and injury. - No traffic light "to beat" – The design of a roundabout promotes a continuous circular flow of traffic. Because of this design, drivers will not have the incentive to speed up to "beat the light", like they may at a traditional intersection. - One way travel – The design of a roundabout directs drivers through gently designed curves into a one-way counterclockwise circular path. This design eliminates the possibilities for T-bone and head-on collisions. In addition, a conventional 4-way intersection has 32 points of vehicle conflict due to the different crossings and maneuvers through the intersection. A roundabout has 8 points of conflict, which all occur in the same direction, reducing crash severity and likelihood of injury.
868	Both the MMMPO corridor study and the 2018 traffic study determined that traffic flow through the corridor is controlled by the congestion at the major intersections in the corridor. The projected growth in the Morgantown area will continue to increase traffic and congestion at the intersections if improvements do not occur. Several studies have been previously completed through the MMMPO, evaluating various transportation plans for the Greenbag Road corridor, with the ultimate vision of transforming Greenbag Road into a safe, efficient, and attractive multimodal transportation facility. The future traffic along Greenbag Road, Mississippi Avenue, Dorsey Avenue, Kingwood Pike were projected for the future design year by assuming existing

	traffic distribution/patterns but with increased traffic volumes though application of a yearly traffic growth rate of 1.16% per year. It should be noted that the traffic evaluation was completed prior to the COVID-19 pandemic and its effects to traffic currently occurring. Road repair beyond the scope of this project is being addressed through the Governor's Roads to Prosperity program and progress can be tracked via the WVDOH website.
869	We appreciate your input regarding the project. The WVDOH will examine all safety concerns as part of the final design.
870	Both the MMMPO corridor study and the 2018 traffic study determined that traffic flow through the corridor is controlled by the congestion at the major intersections in the corridor. The projected growth in the Morgantown area will continue to increase traffic and congestion at the intersections if improvements do not occur. Several studies have been previously completed through the MMMPO, evaluating various transportation plans for the Greenbag Road corridor, with the ultimate vision of transforming Greenbag Road into a safe, efficient, and attractive multimodal transportation facility. Fair market value will be determined by a competent, professional real estate appraiser after a thorough inspection of the property, a comparison with similar properties in the area that have been sold recently, a determination and consideration of its replacement cost and depreciation and consideration of the income-producing potential. All appraisal reports are office-reviewed, then rechecked in the field by experienced, qualified review appraisers for accuracy. Since the Division of Highways has adopted a firm price policy, the property owner will be offered the full amount of the approved appraisal. There will be no attempt to buy property at less than fair market value. This policy guarantees that all citizens of the state receive full value for the money expended for highway rights of way. Those who hold a valid property interest in the property that is acquired for the project will be compensated during the ROW acquisition phase.

872	We appreciate your input regarding the project.
873	The preliminary investigation and engineering traffic study has examined two build alternatives and three options for each of the major intersections. The intersection options that were evaluated and analyzed include turning lanes, traffic signals, and roundabouts. WVDOH requires intersection improvements to meet or exceed an overall intersection LOS C or better during the peak hours studied for design year improvements. The times of day (peak hours) selected to be studied followed WVDOH guidelines and is standard traffic engineering practice for determining future intersection improvements. At the intersection of Greenbag Road/Dorsey Avenue/Kingwood Pike the traffic analysis determined that the intersection would operate at failure (overall intersection LOS F) if existing intersection conditions and operations were to remain the same 30-years in the future (design year) without any improvements. Adding only left turn lanes on Greenbag Road at the Dorsey/Kingwood Pike intersection was evaluated during an initial round of traffic analysis because this option had been suggested by the MPO. The option included upgrading the signal lights to have a protected/permissive left turn phase. The analysis showed that this option would result in some intersection improvements but could not achieve LOS C or better for the overall intersection operation. The overall intersection would operate at an unacceptable LOS (LOS E). In addition, the left turn lane option would result in the eastbound Greenbag Road traffic queue to extend past the Bluegrass Village Driveway. The traffic analysis determined that with installation of a roundabout the overall intersection would operate at a LOS C, meeting WVDOH design year criteria. At the intersection of Greenbag Road/Mississippi Avenue the traffic analysis determined that the intersection would operate at failure (overall intersection LOS F) if existing intersection conditions and operations were to remain the same 30-years in the future (design year) without any improvements. The design year with improvements scenarios evaluated determined that with installation of a roundabout the overall intersection would operate at a LOS A, best operating conditions, for all peak hours studied. Installation of a traffic signal with turn lanes resulted in an overall intersection LOS B during the AM peak hour, with the Mississippi Avenue approach operating at a LOS C. Though the analysis meets WVDOH minimum LOS criteria, the roundabout option exceeds WVDOH minimum LOS criteria. Roundabouts help reduce vehicular delay and promotes a continuous flow of traffic, which increases traffic capacity at an intersection. The roundabouts have been designed with larger vehicles in mind and incorporate truck aprons to support the weight and turning radius of larger vehicles, including school buses. In addition, roundabouts help reduce the likelihood and severity of collisions. Studies by the Federal Highway Administration (FHWA) have shown that roundabouts typically achieve reduction in overall collisions, injury collisions, fatality collisions, and pedestrian collisions. Reasons for these reductions due to the installation of a roundabout include: - Low travel speeds – Drivers must slow down and yield to traffic before entering a roundabout. The reduction in speeds results in a decrease in crash severity and injury.

	- No traffic light "to beat" – The design of a roundabout promotes a continuous circular flow of traffic. Because of this design, drivers will not have the incentive to speed up to "beat the light", like they may at a traditional intersection. - One way travel – The design of a roundabout directs drivers through gently designed curves into a one-way counterclockwise circular path. This design eliminates the possibilities for T-bone and head-on collisions. In addition, a conventional 4-way intersection has 32 points of vehicle conflict due to the different crossings and maneuvers through the intersection. A roundabout has 8 points of conflict, which all occur in the same direction, reducing crash severity and likelihood of injury. Lastly, long-term costs associated with roundabouts are significantly less than a traffic signal, since no electrical costs and no traffic signal maintenance costs are involved with a roundabout. The traffic control plan will continue to be revised during final design, and will not use Aaron's Creek Road as a signed detour. The revised plan intends to utilize the center of the Dorsey/Kingwood roundabout as a temporary intersection with temporary traffic signals. A short-term detour is proposed using Summers School Road while constructing the connection of the existing Kingwood Pike with the new portion.
874	Both the MMMPO corridor study and the 2018 traffic study determined that traffic flow through the corridor is controlled by the congestion at the major intersections in the corridor. The projected growth in the Morgantown area will continue to increase traffic and congestion at the intersections if improvements do not occur. Several studies have been previously completed through the MMMPO, evaluating various transportation plans for the Greenbag Road corridor, with the ultimate vision of transforming Greenbag Road into a safe, efficient, and attractive multimodal transportation facility. The future traffic along Greenbag Road, Mississippi Avenue, Dorsey Avenue, Kingwood Pike were projected for the future design year by assuming existing traffic distribution/patterns but with increased traffic volumes though application of a yearly traffic growth rate of 1.16% per year. It should be noted that the traffic evaluation was completed prior to the COVID-19 pandemic and its effects to traffic currently occurring. The turn lane options that were examined do not improve the level of service as much as the roundabout and the turn lanes at Dorsey Avenue/Kingwood Pike involve complete takes of 2 residences and 1 business. This change will be noted in the FONSI. Adding only left turn lanes on Greenbag Road at the Dorsey/Kingwood Pike intersection was evaluated during an initial round of traffic analysis because this option had been suggested by the MPO. The option included upgrading the signal lights to have a protected/permissive left turn phase. The analysis showed that this option would result in some intersection improvements but could not achieve LOS C or better for the overall intersection operation. The overall intersection would operate at an unacceptable LOS (LOS E or F). The eastbound Greenbag Road traffic queue would extend past the Bluegrass Village Driveway. Based on these findings this option was replaced with Options D and E for the EA analysis.
875	We appreciate your input regarding the project. The MMMPO had completed several previous studies evaluating various transportation plans for the Greenbag Road corridor, with the ultimate vision of transforming Greenbag Road into a safe, efficient, and attractive multimodal

	transportation facility. The scenarios determined to be evaluated in the traffic study evolved from the outcome of the MMMPO's preliminary studies and findings. Existing two-way stop controlled operations with potential roadway improvements were evaluated as part of the traffic, as well as traffic signal and roundabout options. The intersection of Greenbag Road/Dorsey Avenue/Kingwood Pike is currently controlled by a traffic signal and not by a four-way (all-way) stop, which includes stop sign control on each approach. The intersection would operate at failure (overall intersection LOS F) if existing intersection conditions and operations (traffic signal control) were to remain the same 30-years in the future (design year) without any improvements. Therefore, traffic analysis was not completed for a four-way (all-way) stop controlled intersection operations.
876	We appreciate your input regarding the project.
877	Both the MMMPO corridor study and the 2018 traffic study determined that traffic flow through the corridor is controlled by the congestion at the major intersections in the corridor. The projected growth in the Morgantown area will continue to increase traffic and congestion at the intersections if improvements do not occur. Several studies have been previously completed through the MMMPO, evaluating various transportation plans for the Greenbag Road corridor, with the ultimate vision of transforming Greenbag Road into a safe, efficient, and attractive multimodal transportation facility. The future traffic along Greenbag Road, Mississippi Avenue, Dorsey Avenue, Kingwood Pike were projected for the future design year by assuming existing traffic distribution/patterns but with increased traffic volumes though application of a yearly traffic growth rate of 1.16% per year. It should be noted that the traffic evaluation was completed prior to the COVID-19 pandemic and its effects to traffic currently occurring. The EA reviewed multiple alternatives including turn lanes, traffic lights, and the roundabouts. Through the analysis in the EA, the only alternative that meets the purpose and need of the project is the roundabout. A traffic study was completed in 2018 to determine the current conditions and provide data for estimates of future conditions. The study showed that the current level of service for the Dorsey Avenue/Kingwood Pike intersection to be C in both morning and evening and for Mississippi Street a C in the morning and an A in the evening. The study used a forecasted growth rate of 1.16% per year provided by the MMMPO to create projections for the design year (2048) levels of service. Forecasted 2048 level of service for the Dorsey Avenue/Kingwood Pike intersection is C in morning and F in evening and for Mississippi Street an F in the morning and a D in the evening indicating that as the Morgantown area continues to grow the traffic congestion at these intersections will increase as well. Increased congestion leads to longer travel times and more opportunities for safety incidents and serious injuries.
878	Both the MMMPO corridor study and the 2018 traffic study determined that traffic flow through the corridor is controlled by the congestion at the major intersections in the corridor. The projected growth in the Morgantown area will continue to increase traffic and congestion at the

	intersections if improvements do not occur. The Greenbag Road corridor has long been recognized as a challenging roadway to navigate due to geometric deficiencies, significant intersection delays during the peak hours, and increased volume of truck traffic and development within the corridor. Several studies have been previously completed through the MMMPO, evaluating various transportation plans for the Greenbag Road corridor, with the ultimate vision of transforming Greenbag Road into a safe, efficient, and attractive multimodal transportation facility. The future traffic along Greenbag Road, Mississippi Avenue, Dorsey Avenue, Kingwood Pike were projected for the future design year by assuming existing traffic distribution/patterns but with increased traffic volumes though application of a yearly traffic growth rate of 1.16% per year. It should be noted that the traffic evaluation was completed prior to the COVID-19 pandemic and its effects to traffic currently occurring. Road repair beyond the scope of this project is being addressed through the Governor's Roads to Prosperity program and progress can be tracked via the WVDOH website.
879	Both the MMMPO corridor study and the 2018 traffic study determined that traffic flow through the corridor is controlled by the congestion at the major intersections in the corridor. The projected growth in the Morgantown area will continue to increase traffic and congestion at the intersections if improvements do not occur. The Greenbag Road corridor has long been recognized as a challenging roadway to navigate due to geometric deficiencies, significant intersection delays during the peak hours, and increased volume of truck traffic and development within the corridor. 880	We appreciate your input regarding the project.
881	We appreciate your input regarding the project.
882	The EA reviewed multiple alternatives including turn lanes, traffic lights, and the roundabouts. Through the analysis in the EA, the only alternative that meets the purpose and need of the project is the roundabout. Both the MMMPO corridor study and the 2018 traffic study determined that traffic flow through the corridor is controlled by the congestion at the major intersections in the corridor. The projected growth in the Morgantown area will continue to increase traffic and congestion at the intersections if improvements do not occur. The Greenbag Road corridor has long been recognized as a challenging roadway to navigate due to geometric deficiencies, significant intersection delays during the peak hours, and increased volume of truck traffic and development within the corridor. Several studies have been previously completed through the MMMPO, evaluating various transportation plans for the Greenbag Road corridor, with the ultimate vision of transforming Greenbag Road into a safe, efficient, and attractive multimodal transportation facility. The future traffic along Greenbag Road, Mississippi Avenue, Dorsey Avenue, Kingwood Pike were projected for the future design year by assuming existing traffic distribution/patterns but with increased traffic volumes though application of a yearly traffic growth rate of 1.16% per year. It should be noted that the traffic evaluation was completed prior to the COVID-19 pandemic and its effects to traffic currently occurring. The turn lane options that were examined do not improve the level of service as much as the roundabout and the turn lanes at Dorsey Avenue/Kingwood Pike involve complete takes of 2 residences and 1 business. This change will be noted in the FONSI. Adding only left turn lanes on Greenbag Road at the Dorsey/Kingwood Pike intersection was evaluated during an initial round of traffic analysis because this option had been suggested by the MPO. The option included upgrading the signal lights to have a protected/permissive left turn phase. The analysis showed that this option would result in some intersection improvements but could not achieve LOS C or better for the overall intersection operation. The overall intersection would operate at an unacceptable LOS (LOS E or F). The eastbound Greenbag Road traffic queue would extend past the Bluegrass Village Driveway. Based on these findings this option was replaced with Options D and E for the EA analysis. In regards to cost, since the traffic analysis determined that left turn lanes on Greenbag Road did not meet WVDOH's LOS criteria, a cost estimate was not prepared. However, long-term costs associated with roundabouts are significantly less than a traffic signal, since no electrical costs and no traffic signal maintenance are involved with a roundabout.
883	Thank you for enumerating the safety concerns. The WVDOH will examine all safety concerns as part of the final design. The proposed project includes construction of new sidewalks, which create safe facilities for all users of the corridor. The project will be constructed in compliance with the Americans with Disabilities Act. All roadway crossings will be marked and signed as crosswalks. Roundabouts are designed to slow speeds in the approach and through the roundabout allowing drivers more response time and limiting the

	number of potential directions where traffic could approach. Both of these factors improve safety for all drivers, including older drivers as well as pedestrians, and cyclists.
884	The roundabouts were designed to accommodate AASHTO WB-62 truck configuration, which is an interstate semi-truck with a 62' wheel base between steer axle and last trailer axle, including a 48' trailer. Larger trucks can navigate the roundabout and use the internal truck apron.
885	The designs for the roadway and intersection improvements have factored the topography, safety issues, constructability, and current land use to develop feasible alternatives. The roundabouts were designed to accommodate AASHTO WB-62 truck configuration, which is an interstate semi-truck with a 62' wheel base between steer axle and last trailer axle, including a 48' trailer. Larger trucks can navigate the roundabout and use the internal truck apron. The existing grade on Kingwood Pike requires stopping on a -6.5% grade at the traffic signal. The grade approaching the roundabout includes a flat grade of less than 2% at the roundabout. In most cases, the roundabout will not require approaching traffic to come to a full or immediate stop, and does not queue traffic on the steep grade as the existing traffic signal does. The preferred alternative includes the construction of another retaining wall at the intersection of Kingwood Pike and Greenbag Road. At this time the proposed retaining wall on the south side of Greenbag Road east of the roundabout is anticipated to be approximately 350 feet in length and 8 to 18 feet tall. The final design will factor the geotechnical information needed to design the retaining wall and prevent further damage.
886	Both the MMMPO corridor study and the 2018 traffic study determined that traffic flow through the corridor is controlled by the congestion at the major intersections in the corridor. The projected growth in the Morgantown area will continue to increase traffic and congestion at the intersections if improvements do not occur. The MMMPO had completed several previous studies evaluating various transportation plans for the Greenbag Road corridor, with the ultimate vision of transforming Greenbag Road into a safe, efficient, and attractive multimodal transportation facility. The scenarios determined to be evaluated in the traffic study evolved from the outcome of the MMMPO's preliminary studies and findings. Existing two-way stop controlled operations with potential roadway improvements were evaluated as part of the traffic, as well as traffic signal and roundabout options. The evaluation and analysis of these intersection options indicate that the roundabout would provide the most improvement to traffic congestion, has the lowest estimated construction cost, and does not displace any residences. The diversion of traffic from downtown, including large trucks, is not within the scope of this project. The MMMPO had completed several previous studies evaluating various transportation plans for the Greenbag Road corridor, with the ultimate vision of transforming Greenbag Road into a safe, efficient, and attractive multimodal transportation facility. The scenarios determined to be

	evaluated in the traffic study evolved from the outcome of the MMMPO's preliminary studies and findings. Existing two-way stop controlled operations with potential roadway improvements were evaluated as part of the traffic, as well as traffic signal and roundabout options. The intersection of Greenbag Road/Dorsey Avenue/Kingwood Pike is currently controlled by a traffic signal and not by a four-way (all-way) stop, which includes stop sign control on each approach. The intersection would operate at failure (overall intersection LOS F) if existing intersection conditions and operations (traffic signal control) were to remain the same 30-years in the future (design year) without any improvements. Therefore, traffic analysis was not completed for a four-way (all-way) stop controlled intersection operations.
887	We appreciate your input regarding the project. Any property needed for the project will be acquired under the Uniform Relocation Assistance and Real Property Acquisition Act (1970) through negotiations with the landowners.
888	Both the MMMPO corridor study and the 2018 traffic study determined that traffic flow through the corridor is controlled by the congestion at the major intersections in the corridor. The projected growth in the Morgantown area will continue to increase traffic and congestion at the intersections if improvements do not occur. Several studies have been previously completed through the MMMPO, evaluating various transportation plans for the Greenbag Road corridor, with the ultimate vision of transforming Greenbag Road into a safe, efficient, and attractive multimodal transportation facility. The future traffic along Greenbag Road, Mississippi Avenue, Dorsey Avenue, Kingwood Pike were projected for the future design year by assuming existing traffic distribution/patterns but with increased traffic volumes though application of a yearly traffic growth rate of 1.16% per year. It should be noted that the traffic evaluation was completed prior to the COVID-19 pandemic and its effects to traffic currently occurring. Road repair beyond the scope of this project is being addressed through the Governor's Roads to Prosperity program and progress can be tracked via the WVDOH website.
889	A shared-use path was part of some early versions of the project, but the right of way impacts along Bluegrass Village and the Kennedy Center were significant. Due to these detrimental impacts the shared use path was removed from the alternatives that were advanced to the EA. The sidewalk design has been extended from the western end of the project area along Greenbag Road to the Dorsey Avenue/Kingwood Pike intersection. At the intersection the sidewalk follows Dorsey Avenue north to Luckey Lane and east on Luckey Lane to the connection with the existing sidewalk at Mountainview Elementary School. The shoulder along the north side of Greenbag Road is being designed to accommodate bicycle use by being wider (3 feet) than the standard shoulder (2 feet). Extensions beyond the scope of this project can be considered during future planning.

890	The EA reviewed multiple alternatives including turn lanes, traffic lights, and the roundabouts. Through the analysis in the EA, the only alternative that meets the purpose and need of the project is the roundabout. Several studies have been previously completed through the MMMPO, evaluating various transportation plans for the Greenbag Road corridor, with the ultimate vision of transforming Greenbag Road into a safe, efficient, and attractive multimodal transportation facility. The future traffic along Greenbag Road, Mississippi Avenue, Dorsey Avenue, Kingwood Pike were projected for the future design year by assuming existing traffic distribution/patterns but with increased traffic volumes though application of a yearly traffic growth rate of 1.16% per year. It should be noted that the traffic evaluation was completed prior to the COVID-19 pandemic and its effects to traffic currently occurring. The turn lane options that were examined do not improve the level of service as much as the roundabout and the turn lanes at Dorsey Avenue/Kingwood Pike involve complete takes of 2 residences and 1 business. This change will be noted in the FONSI. Adding only left turn lanes on Greenbag Road at the Dorsey/Kingwood Pike intersection was evaluated during an initial round of traffic analysis because this option had been suggested by the MPO. The option included upgrading the signal lights to have a protected/permissive left turn phase. The analysis showed that this option would result in some intersection improvements but could not achieve LOS C or better for the overall intersection operation. The overall intersection would operate at an unacceptable LOS (LOS E or F). The eastbound Greenbag Road traffic queue would extend past the Bluegrass Village Driveway. Based on these findings this option was replaced with Options D and E for the EA analysis. The sidewalk design has been extended from the western end of the project area along Greenbag Road to the Dorsey Avenue/Kingwood Pike intersection. At the intersection the sidewalk follows Dorsey Avenue north to Luckey Lane and east on Luckey Lane to the connection with the existing sidewalk at Mountainview Elementary School. The shoulder along the north side of Greenbag Road is being designed to accommodate bicycle use by being wider (3 feet) than the standard shoulder (2 feet). In regards to cost, since the traffic analysis determined that left turn lanes on Greenbag Road did not meet WVDOH's LOS criteria, a cost estimate was not prepared. However, long-term costs associated with roundabouts are significantly less than a traffic signal, since no electrical costs and no traffic signal maintenance are involved with a roundabout. The diversion of traffic, including large truck traffic, is not within the scope of this project. The roundabouts were designed to accommodate AASHTO WB-62 truck configuration, which is an interstate semi-truck with a 62' wheel base between steer axle and last trailer axle, including a 48' trailer. Larger trucks can navigate the roundabout and use the internal truck apron. Road repair beyond the scope of this project is being addressed through the Governor's Roads to Prosperity program and progress can be tracked via the WVDOH website.

891	Roundabouts are designed to maintain a constant flow of traffic through the intersection which results in reduced congestion on roadways and a reduction in delays for drivers. Studies have shown that changing signalized intersections to roundabouts can have up to an 89% average reduction in vehicle delays. The improved traffic flow also results in reduced vehicle emissions including carbon monoxide, nitrous oxide, and carbon dioxide at the intersection. Additionally, roundabouts are designed to slow speeds in the approach and through the roundabout allowing drivers more response time and limiting the number of potential directions where traffic could approach. Any property needed for the project will be acquired under the Uniform Relocation Assistance and Real Property Acquisition Act (1970) through negotiations with the landowners.
892	The preliminary investigation and engineering traffic study has examined two build alternatives and three options for each of the major intersections. The intersection options that were evaluated and analyzed include turning lanes, traffic signals, and roundabouts. WVDOH requires intersection improvements to meet or exceed an overall intersection LOS C or better during the peak hours studied for design year improvements. The times of day (peak hours) selected to be studied followed WVDOH guidelines and is standard traffic engineering practice for determining future intersection improvements. At the intersection of Greenbag Road/Dorsey Avenue/Kingwood Pike the traffic analysis determined that the intersection would operate at failure (overall intersection LOS F) if existing intersection conditions and operations were to remain the same 30-years in the future (design year) without any improvements. Adding only left turn lanes on Greenbag Road at the Dorsey/Kingwood Pike intersection was evaluated during an initial round of traffic analysis because this option had been suggested by the MPO. The option included upgrading the signal lights to have a protected/permissive left turn phase. The analysis showed that this option would result in some intersection improvements but could not achieve LOS C or better for the overall intersection operation. The overall intersection would operate at an unacceptable LOS (LOS E). In addition, the left turn lane option would result in the eastbound Greenbag Road traffic queue to extend past the Bluegrass Village Driveway. The traffic analysis determined that with installation of a roundabout the overall intersection would operate at a LOS C, meeting WVDOH design year criteria. At the intersection of Greenbag Road/Mississippi Avenue the traffic analysis determined that the intersection would operate at failure (overall intersection LOS F) if existing intersection conditions and operations were to remain the same 30-years in the future (design year) without any improvements. The design year with improvements scenarios evaluated determined that with installation of a roundabout the overall intersection would operate at a LOS A, best operating conditions, for all peak hours studied. Installation of a traffic signal with turn lanes resulted in an overall intersection LOS B during the AM peak hour, with the Mississippi Avenue approach operating at a LOS C. Though the analysis meets WVDOH minimum LOS criteria, the roundabout option exceeds WVDOH minimum LOS criteria. Roundabouts help reduce vehicular delay and promotes a continuous flow of traffic, which increases traffic capacity at an intersection.

	The roundabouts have been designed with larger vehicles in mind and incorporate truck aprons to support the weight and turning radius of larger vehicles, including school buses. In addition, roundabouts help reduce the likelihood and severity of collisions. Studies by the Federal Highway Administration (FHWA) have shown that roundabouts typically achieve reduction in overall collisions, injury collisions, fatality collisions, and pedestrian collisions. Reasons for these reductions due to the installation of a roundabout include: - Low travel speeds – Drivers must slow down and yield to traffic before entering a roundabout. The reduction in speeds results in a decrease in crash severity and injury. - No traffic light "to beat" – The design of a roundabout promotes a continuous circular flow of traffic. Because of this design, drivers will not have the incentive to speed up to "beat the light", like they may at a traditional intersection. - One way travel – The design of a roundabout directs drivers through gently designed curves into a one-way counterclockwise circular path. This design eliminates the possibilities for T-bone and head-on collisions. In addition, a conventional 4-way intersection has 32 points of vehicle conflict due to the different crossings and maneuvers through the intersection. A roundabout has 8 points of conflict, which all occur in the same direction, reducing crash severity and likelihood of injury. Lastly, long-term costs associated with roundabouts are significantly less than a traffic signal, since no electrical costs and no traffic signal maintenance costs are involved with a roundabout. Conscious Harvest Cooperative Community Garden, Joy and Hemp Universal LLC, and Mockingbird Hill Farms are located on private property and the property owner will be compensated for the sale of any land to the WVDOH during the right-of-way acquisition process. Impacts to this parcel have been minimized to the extent practicable. Approximately 1.56 acres (67,900 square feet) will be required from the parcel. Fair market value will be paid for all properties that require full or partial acquisition as a result of the project. When only part of the property is required, as is the case with this parcel, fair market value of the part taken will be paid, plus damages, if any, to the residue, less all benefits. West Virginia law defines "market value" as the price a willing buyer would pay a willing seller, neither acting under compulsion nor duress, both exercising prudence and intelligent judgment as to its value and familiar with the purpose for which the property is reasonably available. Fair market value will be determined by a competent, professional real estate appraiser after a thorough inspection of the property, a comparison with similar properties in the area that have been sold recently, a determination and consideration of its replacement cost and depreciation and consideration of the income-producing potential. All appraisal reports are office-reviewed, then rechecked in the field by experienced, qualified review appraisers for accuracy. Since the Division of Highways has adopted a firm price policy, the property owner will be offered the full amount of the approved appraisal. There will be no attempt to buy property at less than fair market value. This policy guarantees that all citizens of the state receive full value for the money expended for highway rights of way.

	Those who hold a valid property interest in the property that is acquired for the project will be compensated during the ROW acquisition phase. The EA reported impacts to Federal Farmland Protection Policy Act (FPPA) soils. The entire Greenbag Road environmental study area is encompassed by "land already in or committed to urban development" as defined by the FPPA (see 7 CFR § 658.2 - Definitions) and is therefore not subject to provisions of FPPA. Please refer to the Farmland Appendix attached to the FONSI for further detail. The sidewalk design has been extended from the western end of the project area along Greenbag Road to the Dorsey Avenue/Kingwood Pike intersection. At the intersection the sidewalk follows Dorsey Avenue north to Luckey Lane and east on Luckey Lane to the connection with the existing sidewalk at Mountainview Elementary School. The shoulder along the north side of Greenbag Road is being designed to accommodate bicycle use by being wider (3 feet) than the standard shoulder (2 feet).
893	We appreciate your input regarding the project. Any property needed for the project will be acquired under the Uniform Relocation Assistance and Real Property Acquisition Act (1970) through negotiations with the landowners.
894	The EA reviewed multiple alternatives including turn lanes, traffic lights, and the roundabouts. Through the analysis in the EA, the only alternative that meets the purpose and need of the project is the roundabout. Several studies have been previously completed through the MMMPO, evaluating various transportation plans for the Greenbag Road corridor, with the ultimate vision of transforming Greenbag Road into a safe, efficient, and attractive multimodal transportation facility. The future traffic along Greenbag Road, Mississippi Avenue, Dorsey Avenue, Kingwood Pike were projected for the future design year by assuming existing traffic distribution/patterns but with increased traffic volumes though application of a yearly traffic growth rate of 1.16% per year. It should be noted that the traffic evaluation was completed prior to the COVID-19 pandemic and its effects to traffic currently occurring. Roundabouts are designed to maintain a constant flow of traffic through the intersection which results in reduced congestion on roadways and a reduction in delays for drivers. Studies have shown that changing signalized intersections to roundabouts can have up to an 89% average reduction in vehicle delays. The improved traffic flow also results in reduced vehicle emissions including carbon monoxide, nitrous oxide, and carbon dioxide at the intersection. Additionally, roundabouts are designed to slow speeds in the approach and through the roundabout allowing drivers more response time and limiting the number of potential directions where traffic could approach. One of the major differences between Greenbag Road and the Mileground, is the volume of traffic. Greenbag Road has less than half the traffic volume that Mileground has. A second major difference is the general configuration of the roundabouts. The proposed roundabouts on Greenbag are more straightforward and more traditional roundabout designs, without all of the confusing lanes that are present at Mileground. The roundabouts on Greenbag Road will be more intuitive for drivers.

	The turn lane options that were examined do not improve the level of service as much as the roundabout and the turn lanes at Dorsey Avenue/Kingwood Pike involve complete takes of 2 residences and 1 business. This change will be noted in the FONSI. Adding only left turn lanes on Greenbag Road at the Dorsey/Kingwood Pike intersection was evaluated during an initial round of traffic analysis because this option had been suggested by the MPO. The option included upgrading the signal lights to have a protected/permissive left turn phase. The analysis showed that this option would result in some intersection improvements but could not achieve LOS C or better for the overall intersection operation. The overall intersection would operate at an unacceptable LOS (LOS E or F). The eastbound Greenbag Road traffic queue would extend past the Bluegrass Village Driveway. Based on these findings this option was replaced with Options D and E for the EA analysis.
895	The EA reviewed multiple alternatives including turn lanes, traffic lights, and the roundabouts. Through the analysis in the EA, the only alternative that meets the purpose and need of the project is the roundabout. Several studies have been previously completed through the MMMPO, evaluating various transportation plans for the Greenbag Road corridor, with the ultimate vision of transforming Greenbag Road into a safe, efficient, and attractive multimodal transportation facility. 900	The EA reviewed multiple alternatives including turn lanes, traffic lights, and the roundabouts. Through the analysis in the EA, the only alternative that meets the purpose and need of the project is the roundabout. Several studies have been previously completed through the MMMPO, evaluating various transportation plans for the Greenbag Road corridor, with the ultimate vision of transforming Greenbag Road into a safe, efficient, and attractive multimodal transportation facility. The future traffic along Greenbag Road, Mississippi Avenue, Dorsey Avenue, Kingwood Pike were projected for the future design year by assuming existing traffic distribution/patterns but with increased traffic volumes though application of a yearly traffic growth rate of 1.16% per year. It should be noted that the traffic evaluation was completed prior to the COVID-19 pandemic and its effects to traffic currently occurring. The turn lane options that were examined do not improve the level of service as much as the roundabout and the turn lanes at Dorsey Avenue/Kingwood Pike involve complete takes of 2 residences and 1 business. This change will be noted in the FONSI. Adding only left turn lanes on Greenbag Road at the Dorsey/Kingwood Pike intersection was evaluated during an initial round of traffic analysis because this option had been suggested by the MPO. The option included upgrading the signal lights to have a protected/permissive left turn phase. The analysis showed that this option would result in some intersection improvements but could not achieve LOS C or better for the overall intersection operation. The overall intersection would operate at an unacceptable LOS (LOS E or F). The eastbound Greenbag Road traffic queue would extend past the Bluegrass Village Driveway. Based on these findings this option was replaced with Options D and E for the EA analysis. Any property needed for the project will be acquired under the Uniform Relocation Assistance and Real Property Acquisition Act (1970) through negotiations with the landowners.

	Conscious Harvest Cooperative Community Garden, Joy and Hemp Universal LLC, and Mockingbird Hill Farms are located on private property and the property owner will be compensated for the sale of any land to the WVDOH during the right-of-way acquisition process. Impacts to this parcel have been minimized to the extent practicable. Approximately 1.56 acres (67,900 square feet) will be required from the parcel. Fair market value will be paid for all properties that require full or partial acquisition as a result of the project. When only part of the property is required, as is the case with this parcel, fair market value of the part taken will be paid, plus damages, if any, to the residue, less all benefits. West Virginia law defines "market value" as the price a willing buyer would pay a willing seller, neither acting under compulsion nor duress, both exercising prudence and intelligent judgment as to its value and familiar with the purpose for which the property is reasonably available. Fair market value will be determined by a competent, professional real estate appraiser after a thorough inspection of the property, a comparison with similar properties in the area that have been sold recently, a determination and consideration of its replacement cost and depreciation and consideration of the income-producing potential. All appraisal reports are office-reviewed, then rechecked in the field by experienced, qualified review appraisers for accuracy. Since the Division of Highways has adopted a firm price policy, the property owner will be offered the full amount of the approved appraisal. There will be no attempt to buy property at less than fair market value. This policy guarantees that all citizens of the state receive full value for the money expended for highway rights of way. Those who hold a valid property interest in the property that is acquired for the project will be compensated during the ROW acquisition phase. Moving the intersection to the north into the former Atomic Grill location is not feasible given the topography and approach angles.
901	The traffic control plan, which will outline the intended traffic detour tour, will continue to be revised during final design. It should be noted that Aaron's Creek Road will not be utilizes as a signed detour. The anticipated plan intends to utilize the center of the Dorsey Avenue /Kingwood Pike roundabout as a temporary intersection with temporary traffic signals during construction. A short-term detour is proposed using Summers School Road while constructing the connection of the existing Kingwood Pike with the new portion. The turn lane options that were examined do not improve the level of service as much as the roundabout and the turn lanes at Dorsey Avenue/Kingwood Pike involve complete takes of 2 residences and 1 business. These takes are different from what was reported in the EA. This change will be noted in the FONSI. Adding only left turn lanes on Greenbag Road at the Dorsey Avenue/Kingwood Pike intersection was evaluated during an initial round of traffic analysis because this option had been suggested by the MPO. The option included upgrading the traffic signals to provide a protected/permissive left turn phase on Greenbag Road. The analysis showed that this option would result in some intersection improvements but could not achieve LOS C or better for the overall intersection operation. It should be noted that LOS C is WVDOH's design year level of service criteria threshold for intersection improvements. The overall intersection would operate at an

	unacceptable LOS (LOS E). In addition, the left turn lane option would result in the eastbound Greenbag Road traffic queue to extend past the Bluegrass Village Driveway. The need for a sidewalk was identified by the public in the comments for the MMMPO corridor study as one of the factors to improve safety in the Greenbag Road corridor. Pedestrians should use the dedicated crosswalks when safely crossing, just like crossing any other intersection. At a roundabout, pedestrian crosswalks will be placed to cross each roadway leg to the roundabout, which is the same as traditional intersection crossings. The roundabout pedestrian crosswalk placement allows pedestrians to cross one direction of traffic a time at each roundabout approach because of the splitter island. Pedestrians should also use the designated crosswalk locations. Crossing to the center of the roundabout is not recommended.
902	We appreciate your input regarding the project.
903	The preliminary investigation and engineering traffic study has examined two build alternatives and three options for each of the major intersections. The intersection options that were evaluated and analyzed include turning lanes, traffic signals, and roundabouts. WVDOH requires intersection improvements to meet or exceed an overall intersection LOS C or better during the peak hours studied for design year improvements. The times of day (peak hours) selected to be studied followed WVDOH guidelines and is standard traffic engineering practice for determining future intersection improvements. At the intersection of Greenbag Road/Dorsey Avenue/Kingwood Pike the traffic analysis determined that the intersection would operate at failure (overall intersection LOS F) if existing intersection conditions and operations were to remain the same 30-years in the future (design year) without any improvements. Adding only left turn lanes on Greenbag Road at the Dorsey/Kingwood Pike intersection was evaluated during an initial round of traffic analysis because this option had been suggested by the MPO. The option included upgrading the signal lights to have a protected/permissive left turn phase. The analysis showed that this option would result in some intersection improvements but could not achieve LOS C or better for the overall intersection operation. The overall intersection would operate at an unacceptable LOS (LOS E). In addition, the left turn lane option would result in the eastbound Greenbag Road traffic queue to extend past the Bluegrass Village Driveway. The traffic analysis determined that with installation of a roundabout the overall intersection would operate at a LOS C, meeting WVDOH design year criteria. At the intersection of Greenbag Road/Mississippi Avenue the traffic analysis determined that the intersection would operate at failure (overall intersection LOS F) if existing intersection conditions and operations were to remain the same 30-years in the future (design year) without any improvements. The design year with improvements scenarios evaluated determined that with installation of a roundabout the overall intersection would operate at a LOS A, best operating conditions, for all peak hours studied. Installation of a traffic signal with turn lanes resulted in an overall intersection LOS B during the AM peak hour, with the Mississippi Avenue approach operating at a LOS C. Though the

	analysis meets WVDOH minimum LOS criteria, the roundabout option exceeds WVDOH minimum LOS criteria. Roundabouts help reduce vehicular delay and promotes a continuous flow of traffic, which increases traffic capacity at an intersection. The roundabouts have been designed with larger vehicles in mind and incorporate truck aprons to support the weight and turning radius of larger vehicles, including school buses. In addition, roundabouts help reduce the likelihood and severity of collisions. Studies by the Federal Highway Administration (FHWA) have shown that roundabouts typically achieve reduction in overall collisions, injury collisions, fatality collisions, and pedestrian collisions. Reasons for these reductions due to the installation of a roundabout include: - Low travel speeds – Drivers must slow down and yield to traffic before entering a roundabout. The reduction in speeds results in a decrease in crash severity and injury. - No traffic light "to beat" – The design of a roundabout promotes a continuous circular flow of traffic. Because of this design, drivers will not have the incentive to speed up to "beat the light", like they may at a traditional intersection. - One way travel – The design of a roundabout directs drivers through gently designed curves into a one-way counterclockwise circular path. This design eliminates the possibilities for T-bone and head-on collisions. In addition, a conventional 4-way intersection has 32 points of vehicle conflict due to the different crossings and maneuvers through the intersection. A roundabout has 8 points of conflict, which all occur in the same direction, reducing crash severity and likelihood of injury. Lastly, long-term costs associated with roundabouts are significantly less than a traffic signal, since no electrical costs and no traffic signal maintenance costs are involved with a roundabout. Conscious Harvest Cooperative Community Garden, Joy and Hemp Universal LLC, and Mockingbird Hill Farms are located on private property and the property owner will be compensated for the sale of any land to the WVDOH during the right-of-way acquisition process. Impacts to this parcel have been minimized to the extent practicable. Approximately 1.56 acres (67,900 square feet) will be required from the parcel. Fair market value will be paid for all properties that require full or partial acquisition as a result of the project. When only part of the property is required, as is the case with this parcel, fair market value of the part taken will be paid, plus damages, if any, to the residue, less all benefits. West Virginia law defines "market value" as the price a willing buyer would pay a willing seller, neither acting under compulsion nor duress, both exercising prudence and intelligent judgment as to its value and familiar with the purpose for which the property is reasonably available. Fair market value will be determined by a competent, professional real estate appraiser after a thorough inspection of the property, a comparison with similar properties in the area that have been sold recently, a determination and consideration of its replacement cost and depreciation and consideration of the income-producing potential. All appraisal reports are office-reviewed, then rechecked in the field by experienced, qualified review appraisers for accuracy. Since the Division of Highways has adopted a firm price policy, the property owner will be offered the full

	amount of the approved appraisal. There will be no attempt to buy property at less than fair market value. This policy guarantees that all citizens of the state receive full value for the money expended for highway rights of way. Those who hold a valid property interest in the property that is acquired for the project will be compensated during the ROW acquisition phase. Roundabouts help reduce vehicular delay and promotes a continuous flow of traffic, which increases traffic capacity at an intersection. Traffic entering a roundabout on each approach does not need to have the same volume of traffic in order to function optimally. Each roundabout is designed and adapted to the context of its location.
904	The turn lane options that were examined do not improve the level of service as much as the roundabout and the turn lanes at Dorsey Avenue/Kingwood Pike involve complete takes of 2 residences and 1 business. These takes are different from what was reported in the EA. This change will be noted in the FONSI. Adding only left turn lanes on Greenbag Road at the Dorsey/Kingwood Pike intersection was evaluated during an initial round of traffic analysis because this option had been suggested by the MPO. The option included upgrading the signal lights to have a protected/permissive left turn phase. The analysis showed that this option would result in some intersection improvements but could not achieve LOS C or better for the overall intersection operation. The overall intersection would operate at an unacceptable LOS (LOS E or F). The eastbound Greenbag Road traffic queue would extend past the Bluegrass Village Driveway. Based on these findings this option was replaced with Options D and E for the EA analysis. The EA reported impacts to Federal Farmland Protection Policy Act (FPPA) soils. The entire Greenbag Road environmental study area is encompassed by “land already in or committed to urban development” as defined by the FPPA (see 7 CFR § 658.2 - Definitions) and is therefore not subject to provisions of FPPA. Please refer to the Farmland Appendix attached to the FONSI for further detail. Conscious Harvest Cooperative Community Garden, Joy and Hemp Universal LLC, and Mockingbird Hill Farms are located on private property and the property owner will be compensated for the sale of any land to the WVDOH during the right-of-way acquisition process. Impacts to this parcel have been minimized to the extent practicable. Approximately 1.56 acres (67,900 square feet) will be required from the parcel. Fair market value will be paid for all properties that require full or partial acquisition as a result of the project. When only part of the property is required, as is the case with this parcel, fair market value of the part taken will be paid, plus damages, if any, to the residue, less all benefits. West Virginia law defines “market value” as the price a willing buyer would pay a willing seller, neither acting under compulsion nor duress, both exercising prudence and intelligent judgment as to its value and familiar with the purpose for which the property is reasonably available. Fair market value will be determined by a competent, professional real estate appraiser after a thorough inspection of the property, a comparison with similar properties in the area that have been sold recently, a determination and consideration of its replacement cost and depreciation and consideration of the income-producing potential. All appraisal reports are office-reviewed, then rechecked in the field by experienced, qualified

	review appraisers for accuracy. Since the Division of Highways has adopted a firm price policy, the property owner will be offered the full amount of the approved appraisal. There will be no attempt to buy property at less than fair market value. This policy guarantees that all citizens of the state receive full value for the money expended for highway rights of way. Those who hold a valid property interest in the property that is acquired for the project will be compensated during the ROW acquisition phase. The Greenbag Road roundabouts have major differences to other existing roundabouts within Morgantown, including the Mileground. Greenbag Road has less than half the traffic volume of the Mileground. A second major difference is the general configuration of the roundabouts. The proposed roundabouts on Greenbag are more straightforward and more traditional roundabout designs, without all of the confusing lanes that are present at Mileground. The roundabouts on Greenbag Road will be more intuitive for drivers.
905	Both the MMMPO corridor study and the 2018 traffic study determined that traffic flow through the corridor is controlled by the congestion at the major intersections in the corridor. The projected growth in the Morgantown area will continue to increase traffic and congestion at the intersections if improvements do not occur. The EA reviewed multiple alternatives including turn lanes, traffic lights, and the roundabouts. Through the analysis in the EA, the only alternative that meets the purpose and need of the project is the roundabout. The preliminary investigation and engineering traffic study has examined two build alternatives and three options for each of the major intersections. The intersection options that were evaluated and analyzed include turning lanes, traffic signals, and roundabouts. WVDOH requires intersection improvements to meet or exceed an overall intersection LOS C or better during the peak hours studied for design year improvements. The times of day (peak hours) selected to be studied followed WVDOH guidelines and is standard traffic engineering practice for determining future intersection improvements. At the intersection of Greenbag Road/Dorsey Avenue/Kingwood Pike the traffic analysis determined that the intersection would operate at failure (overall intersection LOS F) if existing intersection conditions and operations were to remain the same 30-years in the future (design year) without any improvements. Adding only left turn lanes on Greenbag Road at the Dorsey/Kingwood Pike intersection was evaluated during an initial round of traffic analysis because this option had been suggested by the MPO. The option included upgrading the signal lights to have a protected/permissive left turn phase. The analysis showed that this option would result in some intersection improvements but could not achieve LOS C or better for the overall intersection operation. The overall intersection would operate at an unacceptable LOS (LOS E). In addition, the left turn lane option would result in the eastbound Greenbag Road traffic queue to extend past the Bluegrass Village Driveway. The traffic analysis determined that with installation of a roundabout the overall intersection would operate at a LOS C, meeting WVDOH design year criteria.

	The traffic control plan will continue to be revised during final design, and will not use Aaron's Creek Road as a signed detour. The revised plan intends to utilize the center of the Dorsey/Kingwood roundabout as a temporary intersection with temporary traffic signals. A short-term detour is proposed using Summers School Road while constructing the connection of the existing Kingwood Pike with the new portion. The EA reported impacts to Federal Farmland Protection Policy Act (FPPA) soils. The entire Greenbag Road environmental study area is encompassed by "land already in or committed to urban development" as defined by the FPPA (see 7 CFR § 658.2 - Definitions) and is therefore not subject to provisions of FPPA. Please refer to the Farmland Appendix attached to the FONSI for further detail. Conscious Harvest Cooperative Community Garden, Joy and Hemp Universal LLC, and Mockingbird Hill Farms are located on private property and the property owner will be compensated for the sale of any land to the WVDOH during the right-of-way acquisition process. Impacts to this parcel have been minimized to the extent practicable. Approximately 1.56 acres (67,900 square feet) will be required from the parcel. Fair market value will be paid for all properties that require full or partial acquisition as a result of the project. West Virginia law defines "market value" as the price a willing buyer would pay a willing seller, neither acting under compulsion nor duress, both exercising prudence and intelligent judgment as to its value and familiar with the purpose for which the property is reasonably available. Fair market value will be determined by a competent, professional real estate appraiser after a thorough inspection of the property, a comparison with similar properties in the area that have been sold recently, a determination and consideration of its replacement cost and depreciation and consideration of the income-producing potential. All appraisal reports are office-reviewed, then rechecked in the field by experienced, qualified review appraisers for accuracy. Since the Division of Highways has adopted a firm price policy, the property owner will be offered the full amount of the approved appraisal. There will be no attempt to buy property at less than fair market value. This policy guarantees that all citizens of the state receive full value for the money expended for highway rights of way. Those who hold a valid property interest in the property that is acquired for the project will be compensated during the ROW acquisition phase.
906	Both the MMMPO corridor study and the 2018 traffic study determined that traffic flow through the corridor is controlled by the congestion at the major intersections in the corridor. The projected growth in the Morgantown area will continue to increase traffic and congestion at the intersections if improvements do not occur. The preliminary investigation and engineering traffic study has examined two build alternatives and three options for each of the major intersections. The intersection options that were evaluated and analyzed include turning lanes, traffic signals, and roundabouts. WVDOH requires intersection improvements to meet or exceed an overall intersection LOS C or better during the peak hours studied for design year improvements. The times of day (peak hours) selected to be studied followed WVDOH guidelines and is standard traffic engineering practice for determining future intersection improvements.

	At the intersection of Greenbag Road/Dorsey Avenue/Kingwood Pike the traffic analysis determined that the intersection would operate at failure (overall intersection LOS F) if existing intersection conditions and operations were to remain the same 30-years in the future (design year) without any improvements. Adding only left turn lanes on Greenbag Road at the Dorsey/Kingwood Pike intersection was evaluated during an initial round of traffic analysis because this option had been suggested by the MPO. The option included upgrading the signal lights to have a protected/permissive left turn phase. The analysis showed that this option would result in some intersection improvements but could not achieve LOS C or better for the overall intersection operation. The overall intersection would operate at an unacceptable LOS (LOS E). In addition, the left turn lane option would result in the eastbound Greenbag Road traffic queue to extend past the Bluegrass Village Driveway. The traffic analysis determined that with installation of a roundabout the overall intersection would operate at a LOS C, meeting WVDOH design year criteria. At the intersection of Greenbag Road/Mississippi Avenue the traffic analysis determined that the intersection would operate at failure (overall intersection LOS F) if existing intersection conditions and operations were to remain the same 30-years in the future (design year) without any improvements. The design year with improvements scenarios evaluated determined that with installation of a roundabout the overall intersection would operate at a LOS A, best operating conditions, for all peak hours studied. Installation of a traffic signal with turn lanes resulted in an overall intersection LOS B during the AM peak hour, with the Mississippi Avenue approach operating at a LOS C. Though the analysis meets WVDOH minimum LOS criteria, the roundabout option exceeds WVDOH minimum LOS criteria. Roundabouts help reduce vehicular delay and promotes a continuous flow of traffic, which increases traffic capacity at an intersection. The traffic control plan will continue to be revised during final design, and will not use Aaron's Creek Road as a signed detour. The revised plan intends to utilize the center of the Dorsey/Kingwood roundabout as a temporary intersection with temporary traffic signals. A short-term detour is proposed using Summers School Road while constructing the connection of the existing Kingwood Pike with the new portion.
907	Both the MMMPO corridor study and the 2018 traffic study determined that traffic flow through the corridor is controlled by the congestion at the major intersections in the corridor. The projected growth in the Morgantown area will continue to increase traffic and congestion at the intersections if improvements do not occur. The preliminary investigation and engineering traffic study has examined two build alternatives and three options for each of the major intersections. The intersection options that were evaluated and analyzed include turning lanes, traffic signals, and roundabouts. WVDOH requires intersection improvements to meet or exceed an overall intersection LOS C or better during the peak hours studied for design year improvements. The times of day (peak hours) selected to be studied followed WVDOH guidelines and is standard traffic engineering practice for determining future intersection improvements. At the intersection of Greenbag Road/Dorsey Avenue/Kingwood Pike the traffic analysis determined that the intersection would operate at failure (overall intersection LOS F) if existing intersection conditions and operations were to remain the same 30-years in the future (design year) without any improvements. Adding only left turn lanes on Greenbag Road at the Dorsey/Kingwood Pike intersection was evaluated during

	an initial round of traffic analysis because this option had been suggested by the MPO. The option included upgrading the signal lights to have a protected/permissive left turn phase. The analysis showed that this option would result in some intersection improvements but could not achieve LOS C or better for the overall intersection operation. The overall intersection would operate at an unacceptable LOS (LOS E). In addition, the left turn lane option would result in the eastbound Greenbag Road traffic queue to extend past the Bluegrass Village Driveway. The traffic analysis determined that with installation of a roundabout the overall intersection would operate at a LOS C, meeting WVDOH design year criteria. At the intersection of Greenbag Road/Mississippi Avenue the traffic analysis determined that the intersection would operate at failure (overall intersection LOS F) if existing intersection conditions and operations were to remain the same 30-years in the future (design year) without any improvements. The design year with improvements scenarios evaluated determined that with installation of a roundabout the overall intersection would operate at a LOS A, best operating conditions, for all peak hours studied. Installation of a traffic signal with turn lanes resulted in an overall intersection LOS B during the AM peak hour, with the Mississippi Avenue approach operating at a LOS C. Though the analysis meets WVDOH minimum LOS criteria, the roundabout option exceeds WVDOH minimum LOS criteria. Roundabouts help reduce vehicular delay and promotes a continuous flow of traffic, which increases traffic capacity at an intersection. The hiring and placement of crossing guards falls outside of the purview of the WVDOH. Road repair beyond the scope of this project is being addressed through the Governor's Roads to Prosperity program and progress can be tracked via the WVDOH website.
908	We appreciate your input regarding the project.
909	We appreciate your input regarding the project.
910	We appreciate your understanding during the transition to the virtual meeting format and apologize for any technical difficulties. The Environmental Assessment and additional information can be found on the project website: https://transportation.wv.gov/highways/engineering/comment/closed/greenbagroadimprovementproject/Pages/default.aspx.
911	The option proposed here was one of the options suggested by the MMMPO study (adding left turn lanes only on Greenbag Rd at the Dorsey/Kingwood Pike) and was included on the first round of traffic analysis submitted to the WVDOH in February of 2019. This scenario also included upgrading the existing 2-phase traffic signal to 3-phases to incorporate a protected/permissive left turn phase. Installation of the turn lanes and modifying the signal phasing resulted in various approach and overall intersection LOS improvements; however, LOS C or better for the overall intersection operation could not be achieved. It was projected that some movements and the overall intersection would operate at an unacceptable level of service (LOS E or F). During the PM peak hour, the overall intersection is projected to operate at an overall intersection

	LOS E, and the eastbound through movement is forecasted to operate at a LOS F. This option would result in the Greenbag Road and Dorsey Avenue approaches queue lengths increasing. The eastbound Greenbag Road through movement queue will continue to extend past the Bluegrass Village driveway. Based on these findings and at the direction of the WVDOH, the traffic analysis was revised using additional options, which developed into Options D and E examined for the EA. The left turn lane only on Greenbag Road was not developed further and no impacts were assessed for the EA.
912	The turn lane options that were examined do not improve the level of service as much as the roundabout and the turn lanes at Dorsey Avenue/Kingwood Pike involve complete takes of 2 residences and 1 business. These takes are different from what was reported in the EA. This change will be noted in the FONSI. Adding only left turn lanes on Greenbag Road at the Dorsey/Kingwood Pike intersection was evaluated during an initial round of traffic analysis because this option had been suggested by the MPO. The option included upgrading the signal lights to have a protected/permissive left turn phase. The analysis showed that this option would result in some intersection improvements but could not achieve LOS C or better for the overall intersection operation. The overall intersection would operate at an unacceptable LOS (LOS E or F). The eastbound Greenbag Road traffic queue would extend past the Bluegrass Village Driveway. Based on these findings this option was replaced with Options D and E for the EA analysis. Conscious Harvest Cooperative Community Garden, Joy and Hemp Universal LLC, and Mockingbird Hill Farms are located on private property and the property owner will be compensated for the sale of any land to the WVDOH during the right-of-way acquisition process. Impacts to this parcel have been minimized to the extent practicable. Approximately 1.56 acres (67,900 square feet) will be required from the parcel. Fair market value will be paid for all properties that require full or partial acquisition as a result of the project. When only part of the property is required, as is the case with this parcel, fair market value of the part taken will be paid, plus damages, if any, to the residue, less all benefits. West Virginia law defines “market value” as the price a willing buyer would pay a willing seller, neither acting under compulsion nor duress, both exercising prudence and intelligent judgment as to its value and familiar with the purpose for which the property is reasonably available. Fair market value will be determined by a competent, professional real estate appraiser after a thorough inspection of the property, a comparison with similar properties in the area that have been sold recently, a determination and consideration of its replacement cost and depreciation and consideration of the income-producing potential. All appraisal reports are office-reviewed, then rechecked in the field by experienced, qualified review appraisers for accuracy. Since the Division of Highways has adopted a firm price policy, the property owner will be offered the full amount of the approved appraisal. There will be no attempt to buy property at less than fair market value. This policy guarantees that all citizens of the state receive full value for the money expended for highway rights of way. Those who hold a valid property interest in the property that is acquired for the project will be compensated during the ROW acquisition phase.

913	Both the MMMPO corridor study and the 2018 traffic study determined that traffic flow through the corridor is controlled by the congestion at the major intersections in the corridor. The projected growth in the Morgantown area will continue to increase traffic and congestion at the intersections if improvements do not occur. The preliminary investigation and engineering traffic study was completed to evaluate the Greenbag Road corridor, evaluating the existing and potential future operation of the intersections selected for study by WVDOH. The Greenbag Road corridor has long been recognized as a challenging roadway to navigate due to geometric deficiencies, significant intersection delays during the peak hours, and increased volume of truck traffic and development within the corridor. Several studies have been previously completed through the MMMPO, evaluating various transportation plans for the Greenbag Road corridor, with the ultimate vision of transforming Greenbag Road into a safe, efficient, and attractive multimodal transportation facility. It should be noted that the traffic evaluation was completed prior to the COVID-19 pandemic and its effects to traffic currently occurring. At the intersection of Greenbag Road/Dorsey Avenue/Kingwood Pike the traffic analysis determined that the intersection would operate at failure (overall intersection LOS F) if existing intersection conditions and operations were to remain the same 30-years in the future (design year) without any improvements. Adding only left turn lanes on Greenbag Road at the Dorsey/Kingwood Pike intersection was evaluated during an initial round of traffic analysis because this option had been suggested by the MPO. The option included upgrading the signal lights to have a protected/permissive left turn phase. The analysis showed that this option would result in some intersection improvements but could not achieve LOS C or better for the overall intersection operation. The overall intersection would operate at an unacceptable LOS (LOS E). In addition, the left turn lane option would result in the eastbound Greenbag Road traffic queue to extend past the Bluegrass Village Driveway. The traffic analysis determined that with installation of a roundabout the overall intersection would operate at a LOS C, meeting WVDOH design year criteria. The intersection of Greenbag Road/Dorsey Avenue/Kingwood Pike is currently controlled by a traffic signal and not by a four-way (all-way) stop, which includes stop sign control on each approach. The intersection would operate at failure (overall intersection LOS F) if existing intersection conditions and operations (traffic signal control) were to remain the same 30-years in the future (design year) without any improvements. Therefore, traffic analysis was not completed for a four-way (all-way) stop controlled intersection operations. The University Town Center Walmart parking lot is outside the scope of the current project.
914	We appreciate your input regarding the project.
915	The WVDOH will examine all safety concerns including crossings of Greenbag Road as part of the final design.

	Conscious Harvest Cooperative Community Garden, Joy and Hemp Universal LLC, and Mockingbird Hill Farms are located on private property and the property owner will be compensated for the sale of any land to the WVDOH during the right-of-way acquisition process. Impacts to this parcel have been minimized to the extent practicable. Approximately 1.56 acres (67,900 square feet) will be required from the parcel. Fair market value will be paid for all properties that require full or partial acquisition as a result of the project. When only part of the property is required, as is the case with this parcel, fair market value of the part taken will be paid, plus damages, if any, to the residue, less all benefits. West Virginia law defines "market value" as the price a willing buyer would pay a willing seller, neither acting under compulsion nor duress, both exercising prudence and intelligent judgment as to its value and familiar with the purpose for which the property is reasonably available. Fair market value will be determined by a competent, professional real estate appraiser after a thorough inspection of the property, a comparison with similar properties in the area that have been sold recently, a determination and consideration of its replacement cost and depreciation and consideration of the income-producing potential. All appraisal reports are office-reviewed, then rechecked in the field by experienced, qualified review appraisers for accuracy. Since the Division of Highways has adopted a firm price policy, the property owner will be offered the full amount of the approved appraisal. There will be no attempt to buy property at less than fair market value. This policy guarantees that all citizens of the state receive full value for the money expended for highway rights of way. Those who hold a valid property interest in the property that is acquired for the project will be compensated during the ROW acquisition phase.
916	We appreciate your input regarding the project.
917	We appreciate your input regarding the project.
918	Road repair beyond the scope of this project is being addressed through the Governor's Roads to Prosperity program and progress can be tracked via the WVDOH website.
919	The preliminary investigation and engineering traffic study has examined two build alternatives and three options for each of the major intersections. The intersection options that were evaluated and analyzed include turning lanes, traffic signals, and roundabouts. WVDOH requires intersection improvements to meet or exceed an overall intersection LOS C or better during the peak hours studied for design year improvements. The times of day (peak hours) selected to be studied followed WVDOH guidelines and is standard traffic engineering practice for determining future intersection improvements. At the intersection of Greenbag Road/Dorsey Avenue/Kingwood Pike the traffic analysis determined that the intersection would operate at failure (overall intersection LOS F) if existing intersection conditions and operations were to remain the same 30-years in the future (design year) without any improvements. Adding only left turn lanes on Greenbag Road at the Dorsey/Kingwood Pike intersection was evaluated during an initial round of traffic analysis because this option had been suggested by the MPO. The option included upgrading the signal lights to have

	a protected/permissive left turn phase. The analysis showed that this option would result in some intersection improvements but could not achieve LOS C or better for the overall intersection operation. The overall intersection would operate at an unacceptable LOS (LOS E). In addition, the left turn lane option would result in the eastbound Greenbag Road traffic queue to extend past the Bluegrass Village Driveway. The traffic analysis determined that with installation of a roundabout the overall intersection would operate at a LOS C, meeting WVDOH design year criteria. The EA reported impacts to Federal Farmland Protection Policy Act (FPPA) soils. The entire Greenbag Road environmental study area is encompassed by "land already in or committed to urban development" as defined by the FPPA (see 7 CFR § 658.2 - Definitions) and is therefore not subject to provisions of FPPA. Please refer to the Farmland Appendix attached to the FONSI for further detail. Conscious Harvest Cooperative Community Garden, Joy and Hemp Universal LLC, and Mockingbird Hill Farms are located on private property and the property owner will be compensated for the sale of any land to the WVDOH during the right-of-way acquisition process. Impacts to this parcel have been minimized to the extent practicable. Approximately 1.56 acres (67,900 square feet) will be required from the parcel. Fair market value will be paid for all properties that require full or partial acquisition as a result of the project. When only part of the property is required, as is the case with this parcel, fair market value of the part taken will be paid, plus damages, if any, to the residue, less all benefits. West Virginia law defines "market value" as the price a willing buyer would pay a willing seller, neither acting under compulsion nor duress, both exercising prudence and intelligent judgment as to its value and familiar with the purpose for which the property is reasonably available. Fair market value will be determined by a competent, professional real estate appraiser after a thorough inspection of the property, a comparison with similar properties in the area that have been sold recently, a determination and consideration of its replacement cost and depreciation and consideration of the income-producing potential. All appraisal reports are office-reviewed, then rechecked in the field by experienced, qualified review appraisers for accuracy. Since the Division of Highways has adopted a firm price policy, the property owner will be offered the full amount of the approved appraisal. There will be no attempt to buy property at less than fair market value. This policy guarantees that all citizens of the state receive full value for the money expended for highway rights of way. Those who hold a valid property interest in the property that is acquired for the project will be compensated during the ROW acquisition phase. One of the major differences between Greenbag Road and the Mileground, is the volume of traffic. Greenbag Road has less than half the traffic volume that Mileground has. A second major difference is the general configuration of the roundabouts. The proposed roundabouts on Greenbag are more straightforward and more traditional roundabout designs, without all of the confusing lanes that are present at Mileground. The roundabouts on Greenbag Road will be more intuitive for drivers.

920	A shared-use path was part of some early versions of the project, but the right of way impacts along Bluegrass Village and the Kennedy Center were significant. Due to these detrimental impacts the shared use path was removed from the alternatives that were advanced to the EA. The WVDOH will examine all safety concerns including crossings of Greenbag Road as part of the final design.
921	The preliminary investigation and engineering traffic study has examined two build alternatives and three options for each of the major intersections. The intersection options that were evaluated and analyzed include turning lanes, traffic signals, and roundabouts. WVDOH requires intersection improvements to meet or exceed an overall intersection LOS C or better during the peak hours studied for design year improvements. The times of day (peak hours) selected to be studied followed WVDOH guidelines and is standard traffic engineering practice for determining future intersection improvements. At the intersection of Greenbag Road/Dorsey Avenue/Kingwood Pike the traffic analysis determined that the intersection would operate at failure (overall intersection LOS F) if existing intersection conditions and operations were to remain the same 30-years in the future (design year) without any improvements. Adding only left turn lanes on Greenbag Road at the Dorsey/Kingwood Pike intersection was evaluated during an initial round of traffic analysis because this option had been suggested by the MPO. The option included upgrading the signal lights to have a protected/permissive left turn phase. The analysis showed that this option would result in some intersection improvements but could not achieve LOS C or better for the overall intersection operation. The overall intersection would operate at an unacceptable LOS (LOS E). In addition, the left turn lane option would result in the eastbound Greenbag Road traffic queue to extend past the Bluegrass Village Driveway. The traffic analysis determined that with installation of a roundabout the overall intersection would operate at a LOS C, meeting WVDOH design year criteria. At the intersection of Greenbag Road/Mississippi Avenue the traffic analysis determined that the intersection would operate at failure (overall intersection LOS F) if existing intersection conditions and operations were to remain the same 30-years in the future (design year) without any improvements. The design year with improvements scenarios evaluated determined that with installation of a roundabout the overall intersection would operate at a LOS A, best operating conditions, for all peak hours studied. Installation of a traffic signal with turn lanes resulted in an overall intersection LOS B during the AM peak hour, with the Mississippi Avenue approach operating at a LOS C. Though the analysis meets WVDOH minimum LOS criteria, the roundabout option exceeds WVDOH minimum LOS criteria. Roundabouts help reduce vehicular delay and promotes a continuous flow of traffic, which increases traffic capacity at an intersection. One of the major differences between Greenbag Road and the Mileground, is the volume of traffic. Greenbag Road has less than half the traffic volume that Mileground has. A second major difference is the general configuration of the roundabouts. The proposed roundabouts on Greenbag are more straightforward and more traditional roundabout designs, without all of the confusing lanes that are present at Mileground. The roundabouts on Greenbag Road will be more intuitive for drivers.

922	The archaeological survey was conducted according to the guidelines published by the WV State Historic Preservation Office Guidelines for Phase I, II, and III Archaeological Investigations and Technical Reports. The survey included the excavation of 213 shovel test pits, one test excavation unit, and visual inspection of the entire surface area within the defined area of potential effect. Based on the SHPO guidelines, when no cultural resources are identified during the Phase I survey, an abbreviated technical report is acceptable. As the reviewing agency, the WV SHPO concurred with the recommendation that no further archaeological investigations were warranted and no archaeological historic properties are present in the study area. More information is available in the EA appendices. The EA and appendices are available on the WVDOH website: https://transportation.wv.gov/highways/engineering/comment/closed/greenbagroadimprovementproject/Pages/default.aspx.
923	One of the major differences between Greenbag Road and the Mileground, is the volume of traffic. Greenbag Road has less than half the traffic volume that Mileground has. A second major difference is the general configuration of the roundabouts. The proposed roundabouts on Greenbag are more straightforward and more traditional roundabout designs, without all of the confusing lanes that are present at Mileground. The roundabouts on Greenbag Road will be more intuitive for drivers.
924	The traffic control plan will continue to be revised during final design, and will not use Aaron's Creek Road as a signed detour. The revised plan intends to utilize the center of the Dorsey/Kingwood roundabout as a temporary intersection with temporary traffic signals. A short-term detour is proposed using Summers School Road while constructing the connection of the existing Kingwood Pike with the new portion. The EA reviewed multiple alternatives including turn lanes, traffic lights, and the roundabouts. Through the analysis in the EA, the only alternative that meets the purpose and need of the project is the roundabout.
925	The preliminary investigation and engineering traffic study has examined two build alternatives and three options for each of the major intersections. The intersection options that were evaluated and analyzed include turning lanes, traffic signals, and roundabouts. WVDOH requires intersection improvements to meet or exceed an overall intersection LOS C or better during the peak hours studied for design year improvements. The times of day (peak hours) selected to be studied followed WVDOH guidelines and is standard traffic engineering practice for determining future intersection improvements. At the intersection of Greenbag Road/Dorsey Avenue/Kingwood Pike the traffic analysis determined that the intersection would operate at failure (overall intersection LOS F) if existing intersection conditions and operations were to remain the same 30-years in the future (design year) without any improvements. Adding only left turn lanes on Greenbag Road at the Dorsey/Kingwood Pike intersection was evaluated during an initial round of traffic analysis because this option had been suggested by the MPO. The option included upgrading the signal lights to have a protected/permissive left turn phase. The analysis showed that this option would result in some intersection improvements but could not achieve LOS C or better for the overall intersection operation. The overall intersection would operate at an unacceptable LOS (LOS E). In addition, the left turn lane option would result in the eastbound Greenbag Road traffic queue to extend past the Bluegrass Village Driveway.

	The traffic analysis determined that with installation of a roundabout the overall intersection would operate at a LOS C, meeting WVDOH design year criteria. The Greenbag Road roundabouts have major differences to other existing roundabouts within Morgantown, including the Mileground. Greenbag Road has less than half the traffic volume of the Mileground. A second major difference is the general configuration of the roundabouts. The proposed roundabouts on Greenbag are more straightforward and more traditional roundabout designs, without all of the confusing lanes that are present at Mileground. The roundabouts on Greenbag Road will be more intuitive for drivers. Every roundabout is designed and adapted to the context of its location. Conscious Harvest Cooperative Community Garden, Joy and Hemp Universal LLC, and Mockingbird Hill Farms are located on private property and the property owner will be compensated for the sale of any land to the WVDOH during the right-of-way acquisition process. Impacts to this parcel have been minimized to the extent practicable. Approximately 1.56 acres (67,900 square feet) will be required from the parcel. Fair market value will be paid for all properties that require full or partial acquisition as a result of the project. When only part of the property is required, as is the case with this parcel, fair market value of the part taken will be paid, plus damages, if any, to the residue, less all benefits. West Virginia law defines “market value” as the price a willing buyer would pay a willing seller, neither acting under compulsion nor duress, both exercising prudence and intelligent judgment as to its value and familiar with the purpose for which the property is reasonably available. Fair market value will be determined by a competent, professional real estate appraiser after a thorough inspection of the property, a comparison with similar properties in the area that have been sold recently, a determination and consideration of its replacement cost and depreciation and consideration of the income-producing potential. All appraisal reports are office-reviewed, then rechecked in the field by experienced, qualified review appraisers for accuracy. Since the Division of Highways has adopted a firm price policy, the property owner will be offered the full amount of the approved appraisal. There will be no attempt to buy property at less than fair market value. This policy guarantees that all citizens of the state receive full value for the money expended for highway rights of way. Those who hold a valid property interest in the property that is acquired for the project will be compensated during the ROW acquisition phase.
926	The preliminary investigation and engineering traffic study has examined two build alternatives and three options for each of the major intersections. The intersection options that were evaluated and analyzed include turning lanes, traffic signals, and roundabouts. WVDOH requires intersection improvements to meet or exceed an overall intersection LOS C or better during the peak hours studied for design year improvements. The times of day (peak hours) selected to be studied followed WVDOH guidelines and is standard traffic engineering practice for determining future intersection improvements.

	At the intersection of Greenbag Road/Dorsey Avenue/Kingwood Pike the traffic analysis determined that the intersection would operate at failure (overall intersection LOS F) if existing intersection conditions and operations were to remain the same 30-years in the future (design year) without any improvements. The overall intersection would operate at an unacceptable LOS (LOS E). In addition, the left turn lane option would result in the eastbound Greenbag Road traffic queue to extend past the Bluegrass Village Driveway. The traffic analysis determined that with installation of a roundabout the overall intersection would operate at a LOS C, meeting WVDOH design year criteria.
931	The preliminary investigation and engineering traffic study was completed to evaluate the Greenbag Road corridor, evaluating the existing and potential future operation of the intersections selected for study by WVDOH. The Greenbag Road corridor has long been recognized as a challenging roadway to navigate due to geometric deficiencies, significant intersection delays during the peak hours, and increased volume of truck traffic and development within the corridor. Several studies have been previously completed through the MMMPO, evaluating various transportation plans for the Greenbag Road corridor, with the ultimate vision of transforming Greenbag Road into a safe, efficient, and attractive multimodal transportation facility. It should be noted that the traffic evaluation was completed prior to the COVID-19 pandemic and its effects to traffic currently occurring. The EA reported impacts to Federal Farmland Protection Policy Act (FPPA) soils. The entire Greenbag Road environmental study area is encompassed by “land already in or committed to urban development” as defined by the FPPA (see 7 CFR § 658.2 - Definitions) and is therefore not subject to provisions of FPPA. Please refer to the Farmland Appendix attached to the FONSI for further detail. Conscious Harvest Cooperative Community Garden, Joy and Hemp Universal LLC, and Mockingbird Hill Farms are located on private property and the property owner will be compensated for the sale of any land to the WVDOH during the right-of-way acquisition process. Impacts to this parcel have been minimized to the extent practicable. Approximately 1.56 acres (67,900 square feet) will be required from the parcel. Fair market value will be paid for all properties that require full or partial acquisition as a result of the project. When only part of the property is required, as is the case with this parcel, fair market value of the part taken will be paid, plus damages, if any, to the residue, less all benefits. West Virginia law defines “market value” as the price a willing buyer would pay a willing seller, neither acting under compulsion nor duress, both exercising prudence and intelligent judgment as to its value and familiar with the purpose for which the property is reasonably available. All appraisal reports are office-reviewed, then rechecked in the field by experienced, qualified

	review appraisers for accuracy. Since the Division of Highways has adopted a firm price policy, the property owner will be offered the full amount of the approved appraisal. There will be no attempt to buy property at less than fair market value. This policy guarantees that all citizens of the state receive full value for the money expended for highway rights of way. Those who hold a valid property interest in the property that is acquired for the project will be compensated during the ROW acquisition phase.
932	This comment is noted.
933	The traffic control plan will continue to be revised during final design, and will not use Aaron's Creek Road as a signed detour. The revised plan intends to utilize the center of the Dorsey/Kingwood roundabout as a temporary intersection with temporary traffic signals. A short-term detour is proposed using Summers School Road while constructing the connection of the existing Kingwood Pike with the new portion. The option to add left turn lanes only on Greenbag Rd at the Dorsey/Kingwood Pike was one of the options suggested by the MMMPO study and was included on the first round of traffic analysis submitted to the WVDOH in February of 2019. This scenario also included upgrading the existing 2-phase traffic signal to 3-phases to incorporate a protected/permissive left turn phase. Installation of the turn lanes and modifying the signal phasing resulted in various approach and overall intersection LOS improvements; however, LOS C or better for the overall intersection operation could not be achieved. It was projected that some movements and the overall intersection would operate at an unacceptable level of service (LOS E or F). During the PM peak hour, the overall intersection is projected to operate at an overall intersection LOS E, and the eastbound through movement is forecasted to operate at a LOS F. This option would result in the Greenbag Road and Dorsey Avenue approaches queue lengths increasing. The eastbound Greenbag Road through movement queue will continue to extend past the Bluegrass Village driveway. Based on these findings and at the direction of the WVDOH, the traffic analysis was revised using additional options, which developed into Options D and E examined for the EA. The left turn lane only on Greenbag Road was not developed further and no impacts were assessed for the EA. The turn lane options that were examined in the EA do not improve the level of service as much as the roundabout and the turn lanes at Dorsey Avenue/Kingwood Pike involve complete takes of 2 residences and 1 business. These takes are different from what was reported in the EA. This change will be noted in the FONSI.
934	A roundabout may need a little more property within the actual intersection but will take up less space on the streets approaching the roundabout. Installation of the roundabout at the intersection of Greenbag Road/Dorsey Avenue/Kingwood Pike does not result in takes of any residences. The preliminary investigation and engineering traffic study has examined two build alternatives and three options for each of the major intersections. The intersection options that were evaluated and analyzed include turning lanes, traffic signals, and roundabouts. WVDOH requires intersection improvements to meet or exceed an overall intersection LOS C or better during the peak hours studied for design year

	improvements. The times of day (peak hours) selected to be studied followed WVDOH guidelines and is standard traffic engineering practice for determining future intersection improvements. At the intersection of Greenbag Road/Dorsey Avenue/Kingwood Pike the traffic analysis determined that the intersection would operate at failure (overall intersection LOS F) if existing intersection conditions and operations were to remain the same 30-years in the future (design year) without any improvements. Adding only left turn lanes on Greenbag Road at the Dorsey/Kingwood Pike intersection was evaluated during an initial round of traffic analysis because this option had been suggested by the MPO. The option included upgrading the signal lights to have a protected/permissive left turn phase. The analysis showed that this option would result in some intersection improvements but could not achieve LOS C or better for the overall intersection operation. The overall intersection would operate at an unacceptable LOS (LOS E). In addition, the left turn lane option would result in the eastbound Greenbag Road traffic queue to extend past the Bluegrass Village Driveway. The traffic analysis determined that with installation of a roundabout the overall intersection would operate at a LOS C, meeting WVDOH design year criteria. Roundabouts help reduce the likelihood and severity of collisions. Studies by the Federal Highway Administration (FHWA) have shown that roundabouts typically achieve reduction in overall collisions, injury collisions, fatality collisions, and pedestrian collisions. Reasons for these reductions due to the installation of a roundabout include: - Low travel speeds – Drivers must slow down and yield to traffic before entering a roundabout. The reduction in speeds results in a decrease in crash severity and injury. - No traffic light "to beat" – The design of a roundabout promotes a continuous circular flow of traffic. Because of this design, drivers will not have the incentive to speed up to "beat the light", like they may at a traditional intersection. - One way travel – The design of a roundabout directs drivers through gently designed curves into a one-way counterclockwise circular path. This design eliminates the possibilities for T-bone and head-on collisions. In addition, a conventional 4-way intersection has 32 points of vehicle conflict due to the different maneuvers through the intersection. A roundabout has 8 points of conflict, which all occur in the same direction, reducing crash severity and likelihood of injury.
935	The WVDOH developed this project based on recommendations from the preliminary study that was completed by the MMMPO and documented in the Greenbag Road Corridor Study. The MMMPO had completed several previous studies evaluating various transportation plans for the Greenbag Road corridor, with the ultimate vision of transforming Greenbag Road into a safe, efficient, and attractive multimodal transportation facility.

936	We appreciate your input regarding the project.
937	Changes to the interstate access in Morgantown are beyond the scope of the current project. Conscious Harvest Cooperative Community Garden, Joy and Hemp Universal LLC, and Mockingbird Hill Farms are located on private property and the property owner will be compensated for the sale of any land to the WVDOH during the right-of-way acquisition process. Impacts to this parcel have been minimized to the extent practicable. Approximately 1.56 acres (67,900 square feet) will be required from the parcel. Fair market value will be paid for all properties that require full or partial acquisition as a result of the project. When only part of the property is required, as is the case with this parcel, fair market value of the part taken will be paid, plus damages, if any, to the residue, less all benefits. West Virginia law defines "market value" as the price a willing buyer would pay a willing seller, neither acting under compulsion nor duress, both exercising prudence and intelligent judgment as to its value and familiar with the purpose for which the property is reasonably available. Fair market value will be determined by a competent, professional real estate appraiser after a thorough inspection of the property, a comparison with similar properties in the area that have been sold recently, a determination and consideration of its replacement cost and depreciation and consideration of the income-producing potential. All appraisal reports are office-reviewed, then rechecked in the field by experienced, qualified review appraisers for accuracy. Since the Division of Highways has adopted a firm price policy, the property owner will be offered the full amount of the approved appraisal. There will be no attempt to buy property at less than fair market value. This policy guarantees that all citizens of the state receive full value for the money expended for highway rights of way. Those who hold a valid property interest in the property that is acquired for the project will be compensated during the ROW acquisition phase.
938	The Environmental Assessment was approved by Federal Highway Administration on August 28, 2020. Any deficiencies will be re-assessed for potential impacts and any changes will be noted in the FONSI.
939	The traffic control plan will continue to be revised during final design, and will not use Aaron's Creek Road as a signed detour. The revised plan intends to utilize the center of the Dorsey/Kingwood roundabout as a temporary intersection with temporary traffic signals. A short-term detour is proposed using Summers School Road while constructing the connection of the existing Kingwood Pike with the new portion. The preliminary investigation and engineering traffic study has examined two build alternatives and three options for each of the major intersections. The intersection options that were evaluated and analyzed include turning lanes, traffic signals, and roundabouts. WVDOH requires intersection improvements to meet or exceed an overall intersection LOS C or better during the peak hours studied for design year improvements. The times of day (peak hours) selected to be studied followed WVDOH guidelines and is standard traffic engineering practice for determining future intersection improvements.

	At the intersection of Greenbag Road/Dorsey Avenue/Kingwood Pike the traffic analysis determined that the intersection would operate at failure (overall intersection LOS F) if existing intersection conditions and operations were to remain the same 30-years in the future (design year) without any improvements. Adding only left turn lanes on Greenbag Road at the Dorsey/Kingwood Pike intersection was evaluated during an initial round of traffic analysis because this option had been suggested by the MPO. The option included upgrading the signal lights to have a protected/permissive left turn phase. The analysis showed that this option would result in some intersection improvements but could not achieve LOS C or better for the overall intersection operation. The overall intersection would operate at an unacceptable LOS (LOS E). In addition, the left turn lane option would result in the eastbound Greenbag Road traffic queue to extend past the Bluegrass Village Driveway. The traffic analysis determined that with installation of a roundabout the overall intersection would operate at a LOS C, meeting WVDOH design year criteria. Any property needed for the project will be acquired under the Uniform Relocation Assistance and Real Property Acquisition Act (1970) through negotiations with the landowners. Road repair beyond the scope of this project is being addressed through the Governor's Roads to Prosperity program and progress can be tracked via the WVDOH website.
940	The option proposed here was one of the options suggested by the MMMPO study (adding left turn lanes only on Greenbag Rd at the Dorsey/Kingwood Pike) and was included on the first round of traffic analysis submitted to the WVDOH in February of 2019. This scenario also included upgrading the existing 2-phase traffic signal to 3-phases to incorporate a protected/permissive left turn phase. Installation of the turn lanes and modifying the signal phasing resulted in various approach and overall intersection LOS improvements; however, LOS C or better for the overall intersection operation could not be achieved. It was projected that some movements and the overall intersection would operate at an unacceptable level of service (LOS E or F). During the PM peak hour, the overall intersection is projected to operate at an overall intersection LOS E, and the eastbound through movement is forecasted to operate at a LOS F. This option would result in the Greenbag Road and Dorsey Avenue approaches queue lengths increasing. The eastbound Greenbag Road through movement queue will continue to extend past the Bluegrass Village driveway. Based on these findings and at the direction of the WVDOH, the traffic analysis was revised using additional options, which developed into Options D and E examined for the EA. The left turn lane only on Greenbag Road was not developed further and no impacts were assessed for the EA.
941	Both the MMMPO corridor study and the 2018 traffic study determined that traffic flow through the corridor is controlled by the congestion at the major intersections in the corridor. The projected growth in the Morgantown area will continue to increase traffic and congestion at the intersections if improvements do not occur.

	The preliminary investigation and engineering traffic study has examined two build alternatives and three options for each of the major intersections. The intersection options that were evaluated and analyzed include turning lanes, traffic signals, and roundabouts. WVDOH requires intersection improvements to meet or exceed an overall intersection LOS C or better during the peak hours studied for design year improvements. The times of day (peak hours) selected to be studied followed WVDOH guidelines and is standard traffic engineering practice for determining future intersection improvements. At the intersection of Greenbag Road/Dorsey Avenue/Kingwood Pike the traffic analysis determined that the intersection would operate at failure (overall intersection LOS F) if existing intersection conditions and operations were to remain the same 30-years in the future (design year) without any improvements. Adding only left turn lanes on Greenbag Road at the Dorsey/Kingwood Pike intersection was evaluated during an initial round of traffic analysis because this option had been suggested by the MPO. The option included upgrading the signal lights to have a protected/permissive left turn phase. The analysis showed that this option would result in some intersection improvements but could not achieve LOS C or better for the overall intersection operation. The overall intersection would operate at an unacceptable LOS (LOS E). In addition, the left turn lane option would result in the eastbound Greenbag Road traffic queue to extend past the Bluegrass Village Driveway. The traffic analysis determined that with installation of a roundabout the overall intersection would operate at a LOS C, meeting WVDOH design year criteria. At the intersection of Greenbag Road/Mississippi Avenue the traffic analysis determined that the intersection would operate at failure (overall intersection LOS F) if existing intersection conditions and operations were to remain the same 30-years in the future (design year) without any improvements. The design year with improvements scenarios evaluated determined that with installation of a roundabout the overall intersection would operate at a LOS A, best operating conditions, for all peak hours studied. Installation of a traffic signal with turn lanes resulted in an overall intersection LOS B during the AM peak hour, with the Mississippi Avenue approach operating at a LOS C. Though the analysis meets WVDOH minimum LOS criteria, the roundabout option exceeds WVDOH minimum LOS criteria. Roundabouts help reduce vehicular delay and promotes a continuous flow of traffic, which increases traffic capacity at an intersection.
942	A shared-use path was part of some early versions of the project, but the right of way impacts along Bluegrass Village and the Kennedy Center were significant. Due to these detrimental impacts the shared use path was removed from the alternatives that were advanced to the EA. Extensions beyond the scope of this project can be considered during future planning.
943	The roundabouts were designed to accommodate AASHTO WB-62 truck configuration, which is an interstate semi-truck with a 62’ wheel base between steer axle and last trailer axle, including a 48’ trailer. Larger trucks can navigate the roundabout and use the internal truck apron.

944	Both the MMMPO corridor study and the 2018 traffic study determined that traffic flow through the corridor is controlled by the congestion at the major intersections in the corridor. The projected growth in the Morgantown area will continue to increase traffic and congestion at the intersections if improvements do not occur. The preliminary investigation and engineering traffic study has examined two build alternatives and three options for each of the major intersections. The intersection options that were evaluated and analyzed include turning lanes, traffic signals, and roundabouts. WVDOH requires intersection improvements to meet or exceed an overall intersection LOS C or better during the peak hours studied for design year improvements. The times of day (peak hours) selected to be studied followed WVDOH guidelines and is standard traffic engineering practice for determining future intersection improvements. At the intersection of Greenbag Road/Dorsey Avenue/Kingwood Pike the traffic analysis determined that the intersection would operate at failure (overall intersection LOS F) if existing intersection conditions and operations were to remain the same 30-years in the future (design year) without any improvements. Adding only left turn lanes on Greenbag Road at the Dorsey/Kingwood Pike intersection was evaluated during an initial round of traffic analysis because this option had been suggested by the MPO. The option included upgrading the signal lights to have a protected/permissive left turn phase. The analysis showed that this option would result in some intersection improvements but could not achieve LOS C or better for the overall intersection operation. The overall intersection would operate at an unacceptable LOS (LOS E). In addition, the left turn lane option would result in the eastbound Greenbag Road traffic queue to extend past the Bluegrass Village Driveway. The traffic analysis determined that with installation of a roundabout the overall intersection would operate at a LOS C, meeting WVDOH design year criteria. The traffic data used for the development of the Options was based upon the traffic on the roadway in October of 2018. This data shows that 12%, or 1,300 heavy vehicles per day, are straight trucks and larger, therefore the S curves do not currently prevent the use by larger trucks. Road repair beyond the scope of this project is being addressed through the Governor's Roads to Prosperity program and progress can be tracked via the WVDOH website.
945	Both the MMMPO corridor study and the 2018 traffic study determined that traffic flow through the corridor is controlled by the congestion at the major intersections in the corridor. The projected growth in the Morgantown area will continue to increase traffic and congestion at the intersections if improvements do not occur.
946	The proposed project includes improvements to an existing transportation facility and the construction of the project is not expected to stimulate secondary growth, affect land use decisions, or induce land use change. Therefore, the project is not expected to result in light pollution impacts that are significantly worse than conditions currently present within the project area. The lighting layout for the roundabout will be

	developed during final design. The lighting will be designed to attempt to minimize light pollution while maintaining FHWA and WVDOH standards and requirements for lighting of the roundabout.
947	Any property needed for the project will be acquired under the Uniform Relocation Assistance and Real Property Acquisition Act (1970) through negotiations with the landowners. Conscious Harvest Cooperative Community Garden, Joy and Hemp Universal LLC, and Mockingbird Hill Farms are located on private property and the property owner will be compensated for the sale of any land to the WVDOH during the right-of-way acquisition process. Impacts to this parcel have been minimized to the extent practicable. Approximately 1.56 acres (67,900 square feet) will be required from the parcel. Fair market value will be paid for all properties that require full or partial acquisition as a result of the project. When only part of the property is required, as is the case with this parcel, fair market value of the part taken will be paid, plus damages, if any, to the residue, less all benefits. West Virginia law defines "market value" as the price a willing buyer would pay a willing seller, neither acting under compulsion nor duress, both exercising prudence and intelligent judgment as to its value and familiar with the purpose for which the property is reasonably available. Fair market value will be determined by a competent, professional real estate appraiser after a thorough inspection of the property, a comparison with similar properties in the area that have been sold recently, a determination and consideration of its replacement cost and depreciation and consideration of the income-producing potential. All appraisal reports are office-reviewed, then rechecked in the field by experienced, qualified review appraisers for accuracy. Since the Division of Highways has adopted a firm price policy, the property owner will be offered the full amount of the approved appraisal. There will be no attempt to buy property at less than fair market value. This policy guarantees that all citizens of the state receive full value for the money expended for highway rights of way. Those who hold a valid property interest in the property that is acquired for the project will be compensated during the ROW acquisition phase.
948	The WVDOH developed this project based on recommendations from the preliminary study that was completed by the MMMPO and documented in the Greenbag Road Corridor Study. The MMMPO had completed several previous studies evaluating various transportation plans for the Greenbag Road corridor, with the ultimate vision of transforming Greenbag Road into a safe, efficient, and attractive multimodal transportation facility. All comments received by the WVDOH have been included and considered during the analysis and development of the project. All comments are reviewed and considered and, regardless of how they are received, all comments carry equal weight.
949	The turn lane options that were examined do not improve the level of service as much as the roundabout and the turn lanes at Dorsey Avenue/Kingwood Pike involve complete takes of 2 residences and 1 business. These takes are different from what was reported in the EA. This change will be noted in the FONSI. Adding only left turn lanes on Greenbag Road at the Dorsey/Kingwood Pike intersection was evaluated during an initial round of traffic analysis because this option had been suggested by the MPO. The option included upgrading the signal lights to

	have a protected/permissive left turn phase. The analysis showed that this option would result in some intersection improvements but could not achieve LOS C or better for the overall intersection operation. The overall intersection would operate at an unacceptable LOS (LOS E or F). The eastbound Greenbag Road traffic queue would extend past the Bluegrass Village Driveway. Based on these findings this option was replaced with Options D and E for the EA analysis.
950	Conscious Harvest Cooperative Community Garden, Joy and Hemp Universal LLC, and Mockingbird Hill Farms are located on private property and the property owner will be compensated for the sale of any land to the WVDOH during the right-of-way acquisition process. Impacts to this parcel have been minimized to the extent practicable. Approximately 1.56 acres (67,900 square feet) will be required from the parcel. Fair market value will be paid for all properties that require full or partial acquisition as a result of the project. When only part of the property is required, as is the case with this parcel, fair market value of the part taken will be paid, plus damages, if any, to the residue, less all benefits. West Virginia law defines "market value" as the price a willing buyer would pay a willing seller, neither acting under compulsion nor duress, both exercising prudence and intelligent judgment as to its value and familiar with the purpose for which the property is reasonably available. Fair market value will be determined by a competent, professional real estate appraiser after a thorough inspection of the property, a comparison with similar properties in the area that have been sold recently, a determination and consideration of its replacement cost and depreciation and consideration of the income-producing potential. All appraisal reports are office-reviewed, then rechecked in the field by experienced, qualified review appraisers for accuracy. Since the Division of Highways has adopted a firm price policy, the property owner will be offered the full amount of the approved appraisal. There will be no attempt to buy property at less than fair market value. This policy guarantees that all citizens of the state receive full value for the money expended for highway rights of way. Those who hold a valid property interest in the property that is acquired for the project will be compensated during the ROW acquisition phase.
951	The EA analysis included evaluation of potential impacts to numerous categories including natural resources, cultural resources, land use, indirect, and cumulative effects in accordance with NEPA. Findings from the Environmental studies (aquatic resources such as streams and wetlands; rare, threatened and endangered species of plants and animals; floodplains; farmlands; groundwater; hazardous materials; air quality; and noise) that were conducted to evaluate impacts associated with the proposed project are documented in the EA. More information is available in the EA appendices. The EA and appendices are available on the WVDOH website: https://transportation.wv.gov/highways/engineering/comment/closed/greenbagroadimprovementproject/Pages/default.aspx. Conscious Harvest Cooperative Community Garden, Joy and Hemp Universal LLC, and Mockingbird Hill Farms are located on private property and the property owner will be compensated for the sale of any land to the WVDOH during the right-of-way acquisition process. Impacts to this parcel have been minimized to the extent practicable. Approximately 1.56 acres (67,900 square feet) will be required from the parcel.

	Fair market value will be paid for all properties that require full or partial acquisition as a result of the project. When only part of the property is required, as is the case with this parcel, fair market value of the part taken will be paid, plus damages, if any, to the residue, less all benefits. West Virginia law defines "market value" as the price a willing buyer would pay a willing seller, neither acting under compulsion nor duress, both exercising prudence and intelligent judgment as to its value and familiar with the purpose for which the property is reasonably available. Fair market value will be determined by a competent, professional real estate appraiser after a thorough inspection of the property, a comparison with similar properties in the area that have been sold recently, a determination and consideration of its replacement cost and depreciation and consideration of the income-producing potential. All appraisal reports are office-reviewed, then rechecked in the field by experienced, qualified review appraisers for accuracy. Since the Division of Highways has adopted a firm price policy, the property owner will be offered the full amount of the approved appraisal. There will be no attempt to buy property at less than fair market value. This policy guarantees that all citizens of the state receive full value for the money expended for highway rights of way. Those who hold a valid property interest in the property that is acquired for the project will be compensated during the ROW acquisition phase.
952	The EA reported impacts to Federal Farmland Protection Policy Act (FPPA) soils. The entire Greenbag Road environmental study area is encompassed by "land already in or committed to urban development" as defined by the FPPA (see 7 CFR § 658.2 - Definitions) and is therefore not subject to provisions of FPPA. Please refer to the Farmland Appendix attached to the FONSI for further detail. LESA criteria are used under the FPPA. An FPPA review of the project shows that the entire project corridor is within land designated as urbanized area on the US Census Bureau Map and is considered land already in or committed to urban development by the act. Therefore, the Land Evaluation and Site Assessment is not applicable to this project. Conscious Harvest Cooperative Community Garden, Joy and Hemp Universal LLC, and Mockingbird Hill Farms are located on private property and the property owner will be compensated for the sale of any land to the WVDOH during the right-of-way acquisition process. Impacts to this parcel have been minimized to the extent practicable. Approximately 1.56 acres (67,900 square feet) will be required from the parcel. Fair market value will be paid for all properties that require full or partial acquisition as a result of the project. When only part of the property is required, as is the case with this parcel, fair market value of the part taken will be paid, plus damages, if any, to the residue, less all benefits. West Virginia law defines "market value" as the price a willing buyer would pay a willing seller, neither acting under compulsion nor duress, both exercising prudence and intelligent judgment as to its value and familiar with the purpose for which the property is reasonably available. Fair market value will be determined by a competent, professional real estate appraiser after a thorough inspection of the property, a comparison with similar properties in the area that have been sold recently, a determination and consideration of its replacement cost and depreciation and consideration of the income-producing potential. All appraisal reports are office-reviewed, then rechecked in the field by experienced, qualified review appraisers for accuracy. Since the Division of Highways has adopted a firm price policy, the property owner will be offered the full

	amount of the approved appraisal. There will be no attempt to buy property at less than fair market value. This policy guarantees that all citizens of the state receive full value for the money expended for highway rights of way. Those who hold a valid property interest in the property that is acquired for the project will be compensated during the ROW acquisition phase.
953	The EA reviewed multiple alternatives including turn lanes, traffic lights, and the roundabouts. Through the analysis in the EA, the only alternative that meets the purpose and need of the project is the roundabout. The Environmental Assessment was approved by Federal Highway Administration on August 28, 2020.
954	The diversion of traffic from downtown, including large trucks, is not within the scope of this project.
955	The turn lane options that were examined do not improve the level of service as much as the roundabout and the turn lanes at Dorsey Avenue/Kingwood Pike involve complete takes of 2 residences and 1 business. These takes are different from what was reported in the EA. This change will be noted in the FONSI. Adding only left turn lanes on Greenbag Road at the Dorsey/Kingwood Pike intersection was evaluated during an initial round of traffic analysis because this option had been suggested by the MPO. The option included upgrading the signal lights to have a protected/permissive left turn phase. The analysis showed that this option would result in some intersection improvements but could not achieve LOS C or better for the overall intersection operation. The overall intersection would operate at an unacceptable LOS (LOS E or F). The eastbound Greenbag Road traffic queue would extend past the Bluegrass Village Driveway. Based on these findings this option was replaced with Options D and E for the EA analysis. Conscious Harvest Cooperative Community Garden, Joy and Hemp Universal LLC, and Mockingbird Hill Farms are located on private property and the property owner will be compensated for the sale of any land to the WVDOH during the right-of-way acquisition process. Impacts to this parcel have been minimized to the extent practicable. Approximately 1.56 acres (67,900 square feet) will be required from the parcel. Fair market value will be paid for all properties that require full or partial acquisition as a result of the project. When only part of the property is required, as is the case with this parcel, fair market value of the part taken will be paid, plus damages, if any, to the residue, less all benefits. West Virginia law defines “market value” as the price a willing buyer would pay a willing seller, neither acting under compulsion nor duress, both exercising prudence and intelligent judgment as to its value and familiar with the purpose for which the property is reasonably available. Fair market value will be determined by a competent, professional real estate appraiser after a thorough inspection of the property, a comparison with similar properties in the area that have been sold recently, a determination and consideration of its replacement cost and depreciation and consideration of the income-producing potential. All appraisal reports are office-reviewed, then rechecked in the field by experienced, qualified review appraisers for accuracy. Since the Division of Highways has adopted a firm price policy, the property owner will be offered the full

	amount of the approved appraisal. There will be no attempt to buy property at less than fair market value. This policy guarantees that all citizens of the state receive full value for the money expended for highway rights of way. Those who hold a valid property interest in the property that is acquired for the project will be compensated during the ROW acquisition phase.
956	Roundabouts help reduce vehicular delay and promotes a continuous flow of traffic, which increases traffic capacity at an intersection. Traffic entering a roundabout on each approach does not need to have the same volume of traffic in order to function optimally. Each roundabout is designed and adapted to the context of its location.
957	Both the MMMPO corridor study and the 2018 traffic study determined that traffic flow through the corridor is controlled by the congestion at the major intersections in the corridor. The projected growth in the Morgantown area will continue to increase traffic and congestion at the intersections if improvements do not occur. The WVDOH has examined two build alternatives and three options for each of the major intersections. The intersection options that were evaluated and analyzed include turning lanes, traffic signals, and roundabouts. The evaluation and analysis of these intersection options indicate that the roundabout would provide the most improvement to traffic congestion, has the lowest estimated construction cost, and does not displace any residences.
958	Thank you for providing background information on the farm at 27 Kingwood Pike. The final design will factor the geotechnical information needed to design the retaining wall and prevent damage to the residence. The option proposed here was one of the options suggested by the MMMPO study (adding left turn lanes only on Greenbag Rd at the Dorsey/Kingwood Pike) and was included on the first round of traffic analysis submitted to the WVDOH in February of 2019. This scenario also included upgrading the existing 2-phase traffic signal to 3-phases to incorporate a protected/permissive left turn phase. Installation of the turn lanes and modifying the signal phasing resulted in various approach and overall intersection LOS improvements; however, LOS C or better for the overall intersection operation could not be achieved. It was projected that some movements and the overall intersection would operate at an unacceptable level of service (LOS E or F). During the PM peak hour, the overall intersection is projected to operate at an overall intersection LOS E, and the eastbound through movement is forecasted to operate at a LOS F. This option would result in the Greenbag Road and Dorsey Avenue approaches queue lengths increasing. The eastbound Greenbag Road through movement queue will continue to extend past the Bluegrass Village driveway. Based on these findings and at the direction of the WVDOH, the traffic analysis was revised using additional options, which developed into Options D and E examined for the EA. The left turn lane only on Greenbag Road was not developed further and no impacts were assessed for the EA. The traffic data used for the development of the Options was based upon the traffic on the roadway in October of 2018. This data shows that 12%, or 1,300 heavy vehicles per day, are straight trucks and larger. Roundabouts are designed to maintain a constant flow of traffic through the intersection which results in reduced congestion on roadways and a reduction in delays for drivers. Studies have shown that changing signalized intersections to roundabouts can have up to an 89% average reduction in vehicle delays. The improved traffic flow also results in

	reduced vehicle emissions including carbon monoxide, nitrous oxide, and carbon dioxide at the intersection. Additionally, roundabouts are designed to slow speeds in the approach and through the roundabout allowing drivers more response time and limiting the number of potential directions where traffic could approach. Both of these factors improve safety for all drivers, including older drivers as well as pedestrians, and cyclists. The cultural resources surveys were conducted according to the guidelines published by the WV State Historic Preservation Office. The archaeological survey included the excavation of 213 shovel test pits, one test excavation unit, and visual inspection of the entire surface area within the defined area of potential effect. Based on the SHPO guidelines, when no cultural resources are identified during the Phase I survey, an abbreviated technical report is acceptable. As the reviewing agency, the WV SHPO concurred with the recommendation that no further archaeological investigations were warranted and no archaeological historic properties are present in the study area. The historic structures survey resulted in the identification of 25 structures 45+ years old within the defined area of potential effect. Two of the resources were recommended eligible for the National Register of Historic Places and the project was designed to avoid potential impacts to these properties. As the reviewing agency, the WV SHPO concurred with the recommendation that the project would not adversely affect any NRHP eligible resources and that no further historic structures investigations were needed. More information is available in the EA appendices. The EA and appendices are available on the WVDOH website: https://transportation.wv.gov/highways/engineering/comment/closed/greenbagroadimprovementproject/Pages/default.aspx. The EA reported impacts to Federal Farmland Protection Policy Act (FPPA) soils. The entire Greenbag Road environmental study area is encompassed by “land already in or committed to urban development” as defined by the FPPA (see 7 CFR § 658.2 - Definitions) and is therefore not subject to provisions of FPPA. Please refer to the Farmland Appendix attached to the FONSI for further detail. LESA criteria are used under the FPPA. An FPPA review of the project shows that the entire project corridor is within land designated as urbanized area on the US Census Bureau Map and is considered land already in or committed to urban development by the act. Therefore, the Land Evaluation and Site Assessment is not applicable to this project. Conscious Harvest Cooperative Community Garden, Joy and Hemp Universal LLC, and Mockingbird Hill Farms are located on private property and the property owner will be compensated for the sale of any land to the WVDOH during the right-of-way acquisition process. Impacts to this parcel have been minimized to the extent practicable. Approximately 1.56 acres (67,900 square feet) will be required from the parcel. Fair market value will be paid for all properties that require full or partial acquisition as a result of the project. When only part of the property is required, as is the case with this parcel, fair market value of the part taken will be paid, plus damages, if any, to the residue, less all benefits. West Virginia law defines “market value” as the price a willing buyer would pay a willing seller, neither acting under compulsion nor duress, both exercising prudence and intelligent judgment as to its value and familiar with the purpose for which the property is reasonably available. Fair market value will be determined by a competent, professional real estate appraiser after a thorough inspection of the property, a comparison

	with similar properties in the area that have been sold recently, a determination and consideration of its replacement cost and depreciation and consideration of the income-producing potential. All appraisal reports are office-reviewed, then rechecked in the field by experienced, qualified review appraisers for accuracy. Since the Division of Highways has adopted a firm price policy, the property owner will be offered the full amount of the approved appraisal. There will be no attempt to buy property at less than fair market value. This policy guarantees that all citizens of the state receive full value for the money expended for highway rights of way. Those who hold a valid property interest in the property that is acquired for the project will be compensated during the ROW acquisition phase. More information is available in the FONSI and EA appendices. The EA and appendices are available on the WVDOH website: https://transportation.wv.gov/highways/engineering/comment/closed/greenbagroadimprovementproject/Pages/default.aspx.
959	Your comments of January 6, 2021 concerning the Greenbag Road Project U331-857-0.67 in Morgantown have been forwarded to the Engineering Division for a response. This project was identified in Governor Justices Roads to Prosperity program with the support of the Morgantown Monongalia Metropolitan Planning Organization and local officials. Your comments as well as many others received are being considered & will be made part of the project record. You indicate concerns with the condition of roads in the area. Please contact our District Four Office in Clarksburg at 304-326-0124. That office is responsible for maintenance of state- owned roads in Preston County as well as the Morgantown area. With respect to David Ervin's letter to the Dominion Post, "Proposed roundabout threatens historic home", the reference is to the Anderson House located at 27 Kingwood Pike. The Anderson House should not be acquired based on our preliminary project limits. In addition, the Anderson house has been evaluated for its historic significance & the West Virginia Historic Preservation Office has concurred with our recommendation that the Anderson residence is considered not eligible for inclusion in the National Register of Historic Places.

GREENBAG ROAD IMPROVEMENT PROJECT

Virtual Public Meeting

September 29, 2020

5—8 PM

Live presentations of information will be repeated at 5, 6, and 7 pm

All information will remain available throughout the comment period.

State Project U331-857-0.67
Federal Project STP-0857(019)D
Monongalia County, WV

U.S. Department of Transportation Federal Highway Administration

WVDOT

Join us on Tuesday, September 29, from 5:00 to 8:00 PM for a virtual public meeting to present the Environmental Assessment and receive your input for the selected preferred alternative.

WEB LINK: http://go.wv.gov/dotcomment

CALL IN: (855) 925-2801 (Access Code 9374)

TEXT: N606 to 73224

Full Environmental Assessment document is available on the WVDOH website

Comments are due by Thursday, Oct. 29, 2020 and can be submitted during the meeting, on the website (http://go.wv.gov/dotcomment) or mailed to:

Mr. RJ Scites, P.E.
Director, Engineering Division WVDOH

FOR IMMEDIATE RELEASE
Thursday, November 5, 2020
CONTACT: WVDOTCommunications@wv.gov

Division of Highways extends comment period on Greenbag Road Improvement Project in Monongalia County

CHARLESTON, WV – At the request of the public, the West Virginia Division of Highways (WVDOH) has extended the comment period on the Greenbag Road Improvement Project in Monongalia County.

The comment period now closes on Monday, Nov. 30, 2020.

This project provides operational improvements along 1.65 miles of Greenbag Road (County Route 857) southeast of Morgantown. The purpose of the project is to reduce traffic congestion and address the lack of safe non-motorized connections through the corridor.

Click here to access an online comment form on the project on the West Virginia Department of Transportation website. You can also submit a written comment to R.J. Scites, P.E., Director, Engineer Division, West Virginia Division of Highways, 1334 Smith Street, Charleston, WV 25301.

The West Virginia Department of Transportation asks you to please use caution when driving in work zones — **Just. Slow. Down. It's everybody's responsibility**. Drivers should download the WV 511 app for regular traffic and road work updates or go to the website at **https://link.edgepilot.com/s/a625ff92/sVivlJdq1EyfGxIOwSbVSQ?u=http://www.wv511.org/**. For information about the project, visit **Drive Forward WV** or the **WVDOT Facebook**.

Recipient: West Virginia Department of Transportation, West Virginia Department of Highways, Jim Justice

Letter: Greetings,

Petition for Option G: A Community-Based Solution for Greenbag Road Improvement Project!

RECEIVED
DEC 02 2020
ENGINEERING
DIVISION

Petition for Option G: A Community-Based Solution for Greenbag Road Project!

Jennifer Hastings started this petition to West Virginia Department of Transportation and 2 others

This petition is to gather support for an alternative option to the Greenbag Road Improvement Project. We call this: Option G

It is a Community Based Solution to the existing alternatives.

The option preferred by ALL PARTIES, as listed below, combines dedicated left turn lanes for Greenbag Road (as in Option D) with the design features, but no added lanes for Dorsey Avenue and Kingwood Pike described in the Executive Summary of the EA.

These design features include widening traffic lanes, adding sidewalks on Dorsey Avenue, and adding a paved shoulder on Kingwood Pike. This new option would have numerous benefits. It would:

Improve the safety and access for motorized and non-motorized connections;
Reduce impacts to natural resources;
Preserve significantly more of the adjacent farmland of statewide importance;
Reduce the amount of impervious surface, causing fewer impacts to nearby streams and

wetlands;
Limit disturbance to unsuitable soils with a history of slips to prevent likelihood of property damage or loss;
Limit impacts to existing residences and businesses on Dorsey Avenue and Kingwood Pike and account for additional historic and cultural preservation;
Reduce construction costs.

The Concerned Parties and Interested Parties (The Landowners) , as listed below, unanimously support this "Option G ' as "preferred"

Concerned Parties:
Garret Richards, Landowner at the intersection of Greenbag Road / Kingwood Pike
Tommy Richards, Landowner at the intersection of Greenbag Road / Kingwood Pike
Mary Hastings, Landowner at the intersection of Greenbag Road / Kingwood Pike
Dewey Hastings, Landowner at the intersection of Greenbag Road / Kingwood Pike
Andy Pickering, Landowner at the intersection of Dorsey Avenue / Kingwood Pike
Grant Hastings, Landowner on Dorsey Avenue

Conscious Harvest Cooperative, 501(c)(3) - Business, intersection of Greenbag Road / Kingwood Pike
Joey James, Treasure / Jennifer Hastings, Secretary / Ted Hastings, Founding Member / Megan Govindan, President

Joy and Hemp Universal, LLC - Business, intersection of Greenbag Road / Kingwood Pike
Owners: Mary Hastings / Jennifer Hastings / Ted Hastings / Patrick Kyle

Mocking Bird Hill - Business, intersection of Greenbag Road / Kingwood Pike
Owner: Marlin Dehoff

Tong Thai Fresh, LLC - Business, intersection of Greenbag Road / Kingwood Pike
Owner: Shawn Komondor

Christopher Lazzell - Leasee, intersection of Greenbag Road / Kingwood Pike
Shawn Komondor - Leasee, intersection of Greenbag Road / Kingwood Pike

Interested Parties:
Ted Hastings, Heir to land at the intersection of Greenbag Road / Kingwood Pike
Jennifer Hastings, Heir to land at the intersection of Greenbag Road / Kingwood Pike
Patrick Kyle, Heir to land at the intersection of Greenbag Road and Kingwood Pike.

We ask for community support for a solution we can all agree on!

Thank you!

Tim Dilliplane
North Area Resource Soil Scientist
USDA Natural Resources Conservation Service
MLRA Soil Survey Office
201 Scott Avenue
Morgantown, WV 26505

Dear Mr. Dilliplane:

State Project: U331-857-0.67
Federal Project: STP-0857(019)D
Greenbag Road Improvement Project
Monongalia County

Thank you for your review of the proposed Greenbag Road Improvement Project and its potential to impact prime or other important farmland within Monongalia County and the City of Morgantown. We have completed the remaining fields of the CPA-106 form and determined the following:

- The total corridor assessment value result for Part VI is 60 points out of a possible maximum of 160 points.
- The total point value for Part VII is 65 points out of a possible maximum of 260 points.

It is our understanding that sites receiving a total score of less than 160 under Part VI, as the Greenbag Road Improvement Project does, need not be given further consideration for protection and no additional sites need to be evaluated. At your convenience, please confirm if the USDA-NRCS is in agreement with this conclusion, or if any additional information is otherwise required. An FPPA Cover Sheet summary, the CPA-106 form, and a criteria point justification summary is attached to this letter for your reference.

Should you have any questions, please contact Ms. Sydney Burke at (304) 414-6420 or by email at Sydney.T.Burke@wv.gov. Thank you very much.

Very truly yours,

Ben L.Hark

FPPA Soils

The Farmland Protection Policy Act (FPPA) Farmland Conversion Impact Rating (Form CPA-106) for Corridor Projects has been prepared for the proposed project. The Site Assessment score for Part VI was calculated to be 60 points, which is below the 160 points that requires additional consideration for other alternatives (per § 658.4 of the FPPA Rule, 7 CFR 658). Therefore compliance with the FPPA has been achieved. A copy of the FPPA Form and the Rationale for Evaluation are attached.

FPPA soils that are located within the project area are listed below, along with impact estimates based on the proposed Right-of-Way of the selected alternative.

- Prime Farmland soils (3.0 total acres impacted):
  - Lobdell silt loam, 0 to 3 percent slopes, occasionally flooded (Lb)
- Farmland of Statewide Importance soils (5.98 total acres impacted):
  - Clarksburg silt loam, 15 to 25 percent slopes (CkD)
  - Clarksburg silt loam, 8 to 15 percent slopes (CkC)
  - Gilpin-Culleoka-Upshur silt loams, 15 to 25 percent slopes (GuD)
  - Gilpin-Culleoka-Upshur silt loams, 8 to 15 percent slopes (GuC)
  - Lobdell-Holly silt loams (Lh)
  - Zoar silt loam, 3 to 8 percent slopes (ZoB)
  - Zoar silt loam, 8 to 15 percent slopes (ZoC)

A total of 8.98 acres of FPPA soil will be directly impacted by the proposed project.

Land use in the immediate vicinity of the project corridor is primarily commercial and residential. There is active agricultural use in the southeastern region of the corridor that will be directly converted to non-agricultural use.

U.S. DEPARTMENT OF AGRICULTURE
Natural Resources Conservation Service

NRCS-CPA-106
(Rev. 1-91)

FARMLAND CONVERSION IMPACT RATING FOR CORRIDOR TYPE PROJECTS

PART I *(To be completed by Federal Agency)*	3. Date of Land Evaluation Request **3/17/21**	4. Sheet 1 of **1**
1. Name of Project **WVDOH Greenbag Rd Improvements**	5. Federal Agency Involved **FHWA**	
2. Type of Project **Widening, intersection improvements**	6. County and State **Monongalia County, WV**	

PART II *(To be completed by NRCS)*	1. Date Request Received by NRCS **3/23/21**	2. Person Completing Form **Tim Dilliplane**
3. Does the corridor contain prime, unique statewide or local important farmland? (If no, the FPPA does not apply - Do not complete additional parts of this form). YES ☑ NO ☐		4. Acres Irrigated **0** / Average Farm Size **127**

Clear Form

Farmland Conversion Impact Rating
Rationale for Evaluation
Greenbag Road Improvement Project
City of Morgantown, Monongalia County, West Virginia

1. Area in Non-urban Use

   Based on the U.S. Census Bureau Urbanized Area dataset (2018), a review of the Morgantown North and Morgantown South West Virginia USGS 7.5 Minute Quadrangles, site visits, and online aerial mapping, it was determined that approximately 60% of the land located within a one-mile radius of the project is in non-urban use.

   Rating – 7 points

2. Perimeter in Non-urban Use

   Based on the U.S. Census Bureau Urbanized Area dataset (2018), a review of the Morgantown North and Morgantown South West Virginia USGS 7.5 Minute Quadrangles, site visits, and online aerial mapping, it was determined that approximately 25% of the perimeter that borders the site is in non-urban use.

   Rating – 2 points

3. Percent of Corridor Being Farmed (more than five of the last ten years)

   Based on site visits, the City of Morgantown's zoning map, review of current and historical aerial imagery, and additional online mapping sources, a conservative estimate for the percent of the corridor that has been farmed for at least five of the past ten years was determined to be 15% of the project environmental study area.

   Rating – 0 points

4. Protection Provided by State and Local Government

   The project area is within the jurisdictions of Monongalia County and the City of Morgantown. There are no policies or programs for the protection of farmland within the project area based on a review of the City of Morgantown's zoning map and Code of Ordinances, the Monongalia County website, and the West Virginia Farmland Protection website.

   Rating – 0 points

5. Size of Present Farm Unit Compared to Average

   Based on Part II, #4 of the CPA-106 Form and the 2012 USDA Census of Agriculture County Profile (https://www.nass.usda.gov/ Publications/AgCensus/ 2017/Online_Resources/County_Profiles/West_Virginia/cp54061.pdf), the

average farm size within Monongalia County is 127 acres. According to the Monongalia County Parcel Mapper, the largest active farming operation that overlaps with the project study area is 77.07 acres, which is approximately 40% smaller than the average for the County.

Rating – 2 points

6. Creation of Non-Farmable Farmland

The project will result in a substantial impact to one of the two farming operations present within the project area. Approximately 2/3 of the active farming operation present in the southwest quadrant of the Greenbag Road / Dorsey Avenue / Kingwood Pike intersection will be directly impacted by the realignment of Kingwood Pike and a proposed roundabout at the intersection. Furthermore, the proposed project will impact the existing driveway (off of Greenbag Road) that is currently used to access this site. Therefore, it is unlikely that farming operations will continue at this location.

In addition, minor strip takes of additional right-of-way will be required from the Thomas E. Richards Trust Farm operation located on the south side of Greenbag Road and east of Kingwood Pike. Overall, these minor impacts will not affect the overall farming operations at this farm.

The total farmed acreage that will be lost from the site in the southwest quadrant of the Greenbag Road / Dorsey Avenue / Kingwood Pike intersection is 3.3 acres, and the selected alternative is expected to require 8.98 acres of right-of-way acquisition. Therefore, the impact associated with this metric is approximately 37%, or 25 points.

Rating – 25 points

7. Availability of Farm Support Services and Markets

Some farm support services, including Southern States Morgantown Cooperative, Morgantown Power Equipment Inc. and other equipment dealers, Tractor Supply, and a farmer's market are available within five miles of the project site. Based on public involvement activities that occurred through project development, some restaurants in Morgantown seek out locally sourced produce. Farm processing and storage facilities are not evident within five miles of the project area.

Rating – 4 points

8. On Farm-Investments

The areas used for agricultural purposes that overlap with the project area are well-maintained and contain on-farm investments. According to comments received during public involvement activities associated with the project, the land in the southwest quadrant of the Greenbag Road / Dorsey Avenue / Kingwood Pike intersection includes the following investments:

- A fence along the community garden was created with donated funds,
- Improvements to the driveway off of Greenbag Road and gravel parking lot occurred with earned funds and volunteer labor,
- Perennial plants that were purchased with donated and earned funds, including, but not limited to, fig trees that require years of growth before fruiting and hemp plants. Impacts to these investments may occur depending on their locations.
- A pole barn located along the tree line was built with a substantial amount of donated and earned funds and volunteer labor. The structure is used to provide shelter for businesses associated with the property and during fundraising activities.
- A tool shed along the tree line was built with donated and earned funds and includes a mural on the side of the shed that was created by volunteers and local artists.

On-farm investments associated with the Thomas E. Richards Trust Farm operation south of the Greenbag Road corridor and east of Kingwood Pike include a fence (which will be directly impacted by the proposed project) and a large barn / storage facility (which will not be impacted by the proposed project).

Rating – 20 points

9. Effects of Conversion on Farm Support Services

The proposed Greenbag Road Improvements project will not cause a significant reduction in demand for farm support services if the site is converted.

Rating – 0 points

10. Compatibility with Existing Agricultural Use

The Greenbag Road Project proposes improvements to an existing transportation facility in response to area growth and development that is currently occurring. Therefore, interference with land patterns will not occur, and the project will not induce land use change or have any indirect impacts to remaining farmland not directly impacted by the project.

Rating – 0 points

RE: Greenbag Road Improvement Project; Monongalia County, WV

Ms. Burke,

This is to acknowledge receipt of your request for evaluation of important farmland related to the above referenced project in Monongalia County, WV. This important farmland information was requested in order for you to assess the environmental impacts of the proposed project in accordance with the National Environmental Policy Act.

The Farmland Protection Policy Act (FPPA – Public Law 97-98, 7 U.S.C. 4201) established the farmland conversion rating system to evaluate the impacts Federal programs have on the unnecessary and irreversible conversion of farmland to nonagricultural uses. Projects are subject to FPPA requirements if they may irreversibly convert farmland (directly or indirectly) to nonagricultural use and are implemented or assisted by a Federal agency. Assistance from a Federal agency includes loans, financial and technical assistance.

Based on a review of the submitted documents, aerial photography, and the soil survey mapping it is determined that this project **does** impact prime or other important farmland, and is therefore subject to Farmland Protection Policy Act.

If you have any questions regarding this determination, please contact Tim Dilliplane, NRCS Resource Soil Scientist at 304-291-4377 x152.

Respectfully,

Tim Dilliplane
NRCS Resource Soil Scientist

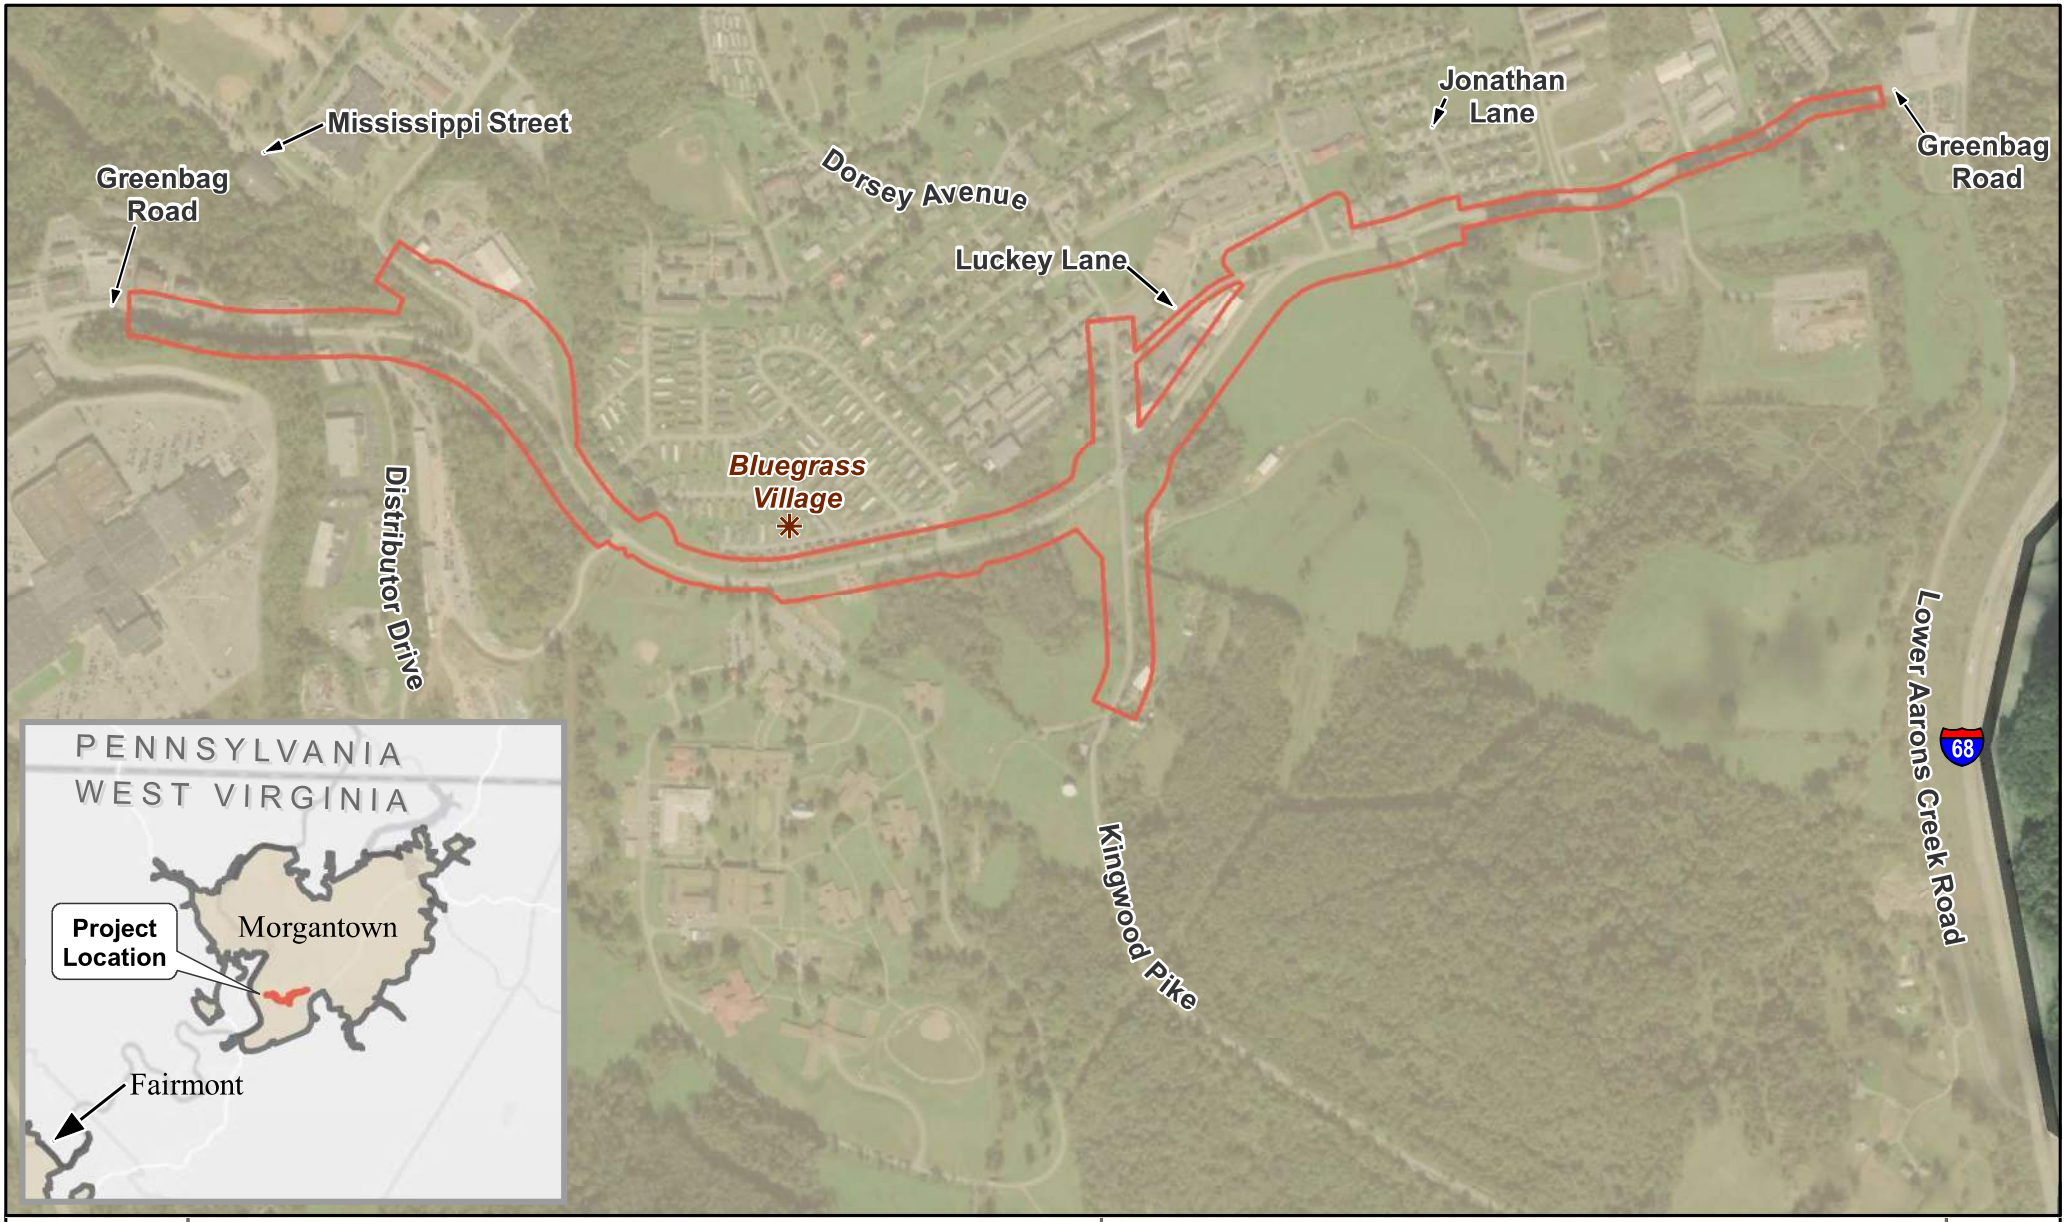
Dear Mr. Beard:

State Project: U331-857-0.67
Federal Project: STP-0857(019)D
Greenbag Road Improvement Project
Monongalia County

Please find attached for your review a location map and CPA-106 form for the above referenced project. We believe the project to be exempt from the Farmland Protection Policy Act (FPPA) based on its location within a United States Census Bureau-designated urbanized area. We request your confirmation of the exemption and any input or concerns your office may have regarding this project.

The proposed project consists of the widening Greenbag Road lanes and providing intersection improvements at the Mississippi Street (CR 857/1) and Dorsey Avenue/ Kingwood Pike (CR81) intersections. The entire project length is approximately 1.65 miles in length and involves the replacement of one culvert structure over Cobun Creek.

Should you have any questions, please contact Ms. Sydney Burke at (304) 414-6420 or by email at Sydney.T.Burke@wv.gov. Thank you very much.



Very truly yours,

Ben L.Hark

Re: Environmental Assessment (EA) U331-857-0.67
Greenbag Road (CR 857)
Morgantown, Monongalia County

Dear Mr. Scites:

The West Virginia Division of Natural Resources (WVDNR) Wildlife Resources Section has reviewed the Environmental Assessment (EA) U331-857-0.67 for 1.65 miles of the Greenbag Road (CR 857) operational improvement project in Morgantown, Monongalia County.

The WVDNR concurs that the EA has adequately addressed all significant environmental issues related to wildlife resources. WVDNR will provide additional comments on the 401 Water Quality Certification and looks forwards to working with the Division of Highways on the completion of this project.

If you have further questions, please contact Anne Wakeford of my staff in Elkins my telephone at 304-637-0245 or email at Anne.M.Wakeford@wv.gov.

Regards,

Danny Bennett

Subject: [External] Greenbag Road Improvement Project EA

CAUTION: External email. Do not click links or open attachments unless you verify sender.

Austen and Sydney,

The U.S. Environmental Protection Agency (EPA) Region 3 has received and reviewed the August 2020 Environmental Assessment (EA) for the Greenbag Road Improvement Project in Monongahela County, West Virginia. The EA was done in compliance with the National Environmental Policy Act (NEPA) of 1969 and Council on Environmental Quality (CEQ) regulations implementing NEPA. The West Virginia Division of Highways (WVDOH), in conjunction with the Federal Highway Administration (FHWA), proposes to provide operational improvements along 1.65 miles of Greenbag Road (CR 857), located southeast of the City of Morgantown in Monongalia County. The EA states that this Project is being undertaken to reduce traffic congestion and address the lack of safe non-motorized connections through the corridor. While we appreciate the abbreviated format of the EA, the document may benefit from more discussion of the analysis used to determine the preferred alternative. Based on our review of the EA, we offer the following comments for consideration.

Purpose and Need
The EA presents an overview of various studies for the Greenbag Road corridor, particularly information from the Morgantown Monongahela Metropolitan Planning Organization (MMMPO). The EA would benefit from a more detailed description of how the various studies were considered in the development of the project purpose and need and alternatives assessment, and the traffic data that supported planning visions. Traffic data may include vehicular accidents and pedestrian usage; providing current conditions and objectives may be used to validate/confirm the project improvement(s). A clear objective and problem statement will assist in determining alternatives that best meet the area need.

Alternatives

We recommend the EA clarify how pedestrian/bike traffic will flow in the project area and navigate the proposed roundabout. The EA would benefit from data and explanation of safety advantages with the proposed roundabout design. It is suggested that the EA provide additional information with consideration to the Alternatives requiring traffic lights (enforceable with traffic cameras) and expanded access to bicycle, electric vehicles (for the handicap) and pedestrian usage.

Natural Resources

We suggest the EA describe the potential increased stormwater impacts and discuss in more detail how stormwater from the existing road and proposed project will be managed. Opportunities to address storm water impacts by pursuing off-site Best Management Practices (BMP) in the upper watersheds of the proposed project may be available, as well as locations within the project area.

Community Impacts

- We recommend a robust public coordination program throughout construction that includes, but is not limited to, communicating detours and traffic disruptions. We also recommend avoiding and/or minimizing construction impacts including, but not limited to, light, noise, dust, and time of construction work.
- We suggest the EA describe the community impacts as a result of the completed preferred alternative. For example, will the completed project impact residents by having increased truck traffic, more lighting, fewer buffers from road, etc? The EA mentions concerns residents have about tree removal and lighting being added.
- The EA should include Executive Order (E.O.) 13045 - Protection of Children from Environmental Health Risks and Safety Risks.
- It is noted that there are a number of Title VI Resources listed in the document. But it is unclear if they are recipients of Federal Funds. Please explain their status in the EA.
- The Environmental Justice (EJ) benchmarks should be clearly defined. It may be helpful, for example to select the state average as the benchmark value, or the lowest benchmarking value for each of the criteria as a way of making the benchmarking process clear and consistent. There appear to be populations of concern that are missed in the assessment. Tables 2, 3 and 4 should be revised to reflect this consideration. It appears that all six block groups are of potential EJ concern. EPA would be pleased to discuss this methodology and evaluation at your convenience.

Other Impacts

- We suggest that the EA evaluate potential adverse impacts to resources, from past, current and foreseeable future activities. Beyond regulatory protections, it may be helpful to identify any activities or mitigative actions that may improve resource condition.
- The EA mentions that utilities will need to be relocated. We suggest additional discussion be provided related to impacts associated with these relocations.
- The EA states that there will be no effect on air quality. If a beneficial effect is anticipated from reduction of truck traffic or improved non-motorized mobility, it is suggested information could be provided. Please feel free to reach out to EPA to discuss air quality assessment.

Thank you for the opportunity to review the EA. Please let me know if you have any questions.

Appendix F: Community Garden Proposal

Introduction

As part of the implementing the Morgantown Monongalia Metropolitan Planning Organization's (MMMPO) Transportation Plan, the West Virginia Department of Transportation-Division of Highways (WVDOH) is preparing to improve the operation of Greenbag Road by widening the road, adding sidewalk and installing roundabouts at two poorly performing intersections. This project will necessitate the elimination of an existing community garden that serves the residents of the surrounding area.

Seeking ways to mitigate this impact, WVDOH contacted the MMMPO and the West Virginia University Center for Resilient Communities (WVU CRC) for their assistance in identifying ways to mitigate the impact of the construction on the community. The MMMPO identified that a broad-based effort was needed to identify an effective mitigation strategy. Working with the WVU CRC, the MMMPO contacted several other interested parties to develop a strategy to mitigate the impact of the Greenbag Road project. This proposal was prepared as a cooperative effort with the WVU Center for Resilient Communities, the WVU Campus Garden, the City of Morgantown, the Monongalia County Commission and the MMMPO.

Problem Statement

The population of the Morgantown urban area has the following issues that make community gardens an important asset to the community.

-There is an unprecedented need countywide for food due to the high number of food insecure families and individuals in the community. As an example, in one day an area food bank provided food to over 300 families. These families and individuals have a particular need for fresh vegetables and fruit. These needs are consistent with the State of West Virginia's ranking as 47th in food insecurity of the 50 US states and its high obesity rate.

-The area around downtown Morgantown is a food desert. The central core of the urban area does not have a ready source of fresh vegetables or fruit.

-The loss of the gardening space on Greenbag Road is difficult to replace because that location is one of the few large plots of suitable land for gardening available in that area.

Proposal

In order to address the need for more community gardens, the partnering agencies are proposing to create a community garden pilot program proposed to be known as the "Morgantown Area Community Garden Initiative." This program will establish garden spaces within the City of Morgantown and the surrounding urbanized area of Monongalia County. The Morgantown Area Community Garden Initiative will provide funding to individual organizations through a competitive application process to be run by the City of Morgantown in cooperation with Monongalia County through the Morgantown Monongalia MPO.

Initiative Goals/Objectives

1) Establish a public gardening space at Hazel's House of Hope, a resource center for the clientele of social service agencies. This facility would be separate from the facility's therapeutic rehabilitation garden. Establishing the initial gardening space at this particular location would expose the clientele of the social service agencies to the idea of community gardening, and they would be able to participate in a community garden at a location they are familiar with.

2) To initiate the establishment of community gardens throughout the urban area to provide fresh fruit and vegetables to individuals who have limited home gardening space. This would also begin to address the issue of the urban area's "food desert."

3) To increase awareness of general food insecurity and the need for local food economies. This will greatly strengthen community resilience.

4) To educate the general public on sustainability and gardening including urban farming techniques. Participants will learn to establish and maintain healthy plants in a garden setting by preparing soils, monitoring water and nutrient needs, and organically managing pests and plant disease. Biodiversity of the garden space will be prioritized. Participants will also be educated on agribusiness concepts, as well as gardening best practices. Ultimately, it is proposed to move the gardens in the program to being self-sustaining with a reduced ecological impact.

It is proposed that the initial phase of the pilot program will be implemented with $15,000 from WVDOH to be distributed to at least three (3) community organizations, individuals, or groups who will be awarded up to $5,000 to meet the goals noted above.

Awardees will be required to meet reporting requirements and to present a progress report on their activities and the status of the garden to the community garden selection board, MMPO representatives and representatives of the City of Morgantown, the Monongalia County Commission, or the appropriate municipality depending on the location of the garden.

Conclusion

This proposal requests funding from the West Virginia Department of Transportation-Division of Highways for mitigation of the lost community garden on Greenbag Road. This funding will not only serve to mitigate the loss of one gardening space, it will also serve to provide for the creation of more gardens through the Morgantown Area Community Garden Initiative. After the demonstration of the viability of this concept through this pilot program the City of Morgantown, Monongalia County, and/or other partners may consider funding the project after the establishment of the three gardens proposed in this application.

A sample budget for a $5,000 grant is provided below:

Garden construction (Raised garden bed supplies, garden shed materials): $2,000

Soil and amendments: $1,000

Fencing, signs, labels, miscellaneous garden supplies: $1,500

Supplies for produce harvesting/packaging: $250

Plant and seeds: $250

Total:$5,000

Actual expenditures to establish a garden would depend on the applicants proposed budget but they would not exceed $5,000 per garden and could include other items such as connecting to a water source.
